A REPRINT

OF THE LAST (1880) EDINBURGH AND LONDON EDITION
OF CHAMBERS'S ENCYCLOPÆDIA,

With Copious Additions by American Editors.

FIFTEEN VOLUMES,

VOLUME III.

NEW YORK:
AMERICAN BOOK EXCHANGE,
TRIBUNE BUILDING,
1880.

AMERICAN PUBLISHER'S NOTICE.

THIS work, although based upon Chambers's Encyclopædia, whose distinguished merit is widely known, differs from it in important respects. It could scarcely be expected that an Encyclopædia, edited and published for a foreign market, would give as much prominence to American topics as American readers might desire. To supply these and other deficiencies the American Editors have inserted about 15,000 titles, arranging the whole, including Chambers's Supplement, in a single alphabet. The total number of titles is now about 40,000. The additions give greater fullness in the departments of biography, geography, history, natural history, and general and applied science. Scrupulous care has been taken not to mutilate or modify the original text of the edition of 1880; no changes have been made except such verbal alterations as are required by the omission of the wood-cuts. The titles of articles from Chambers's Encyclopædia, either from the main work or from the Supplement, are printed in bold-faced type—**AMERICA**. The titles of the American additions, whether of new topics or of enlargements of the old, are printed in plain capitals—**AMERICA**. Should it appear that an article from the English work and its American continuation disagree in any points, the reader will readily refer the conflicting statements to their proper sources.

The labor of consultation will be much reduced by the catch-words in bold-faced type at the top of the page, being the first and last titles of the pages which face each other; and by the full title-words on the back of the volume, being the first and last titles contained therein.

The word *ante* refers to Chambers's Encyclopædia, as represented in this issue. Whenever the word (*ante*) follows a title in the American additions, it indicates that the article is an enlargement of one under the same title in Chambers's Encyclopædia—usually to be found immediately preceding.

v. 3

LIBRARY OF UNIVERSAL KNOWLEDGE.

BRAZEN SEA, the large metal vessel, probably of copper, oval shaped, with 12 oxen for a pedestal—the beasts standing in a circle with their heads outward, and the vessel resting on their rumps. It was in the priest's court of Solomon's temple, and held water for the use of the servitors.

BRAZIL', the most extensive state of South America. Towards the interior, it borders on all the other states of South America except Chili and Buenos Ayres—on Uruguay, the Argentine Confederation, Paraguay, Bolivia, Peru, Ecuador, the United States of Colombia, Venezuela, and Guiana, English, Dutch, and French; while its sea-board, beginning about 200 m. to the n. of the Amazon, and reaching to within the same distance of the Plata, projects into the Atlantic fully 1000 m. to the e. of the direct line—pretty nearly a meridian—between its two extremes. This immense country extends between lat. $4^{\circ} 30'$ n. and 33° s., and between long. 35° and 70° w., being, in round numbers, 2600 m. long and 2500 broad. The area, according to official accounts, is 3,200,000 sq. miles. But B. was not always, in point of extent, what it now is. The Portuguese, who, in 1500, accidentally discovered the s.e. coast of the country (but that only after one of the Pinzons had, on behalf of Spain, followed the shores of the continent from its eastern angle to the mouth of the Orinoco), claimed all between the Plata and the Amazon. Soon, however, the Spaniards of Buenos Ayres, feeling that the complete command of their mighty river was to them a necessary of life, colonized the left bank by founding Montevideo. But nearly twenty years earlier, B. had acquired more territory on the Amazon than it was to abandon on the Plata, having, in 1509, wrested from France, then at war with Portugal, what may now be designated Brazilian Guiana. It was only in 1531 that the Portuguese, busy as they were in India, here planted their first settlement. In 1578, B. fell, along with Portugal itself, under the power of Spain—a connection which, besides being essentially detrimental, speedily threw it as a prey into the hands of the Dutch republic; and though Portugal regained its own independence in 1640, it was not until 1654 that B. was entirely recovered from the Hollanders. Thenceforward, the colony entered on a new era. Supplanted, in a great measure, throughout the east by the Dutch, the mother-country was now directing most of its attention to its possessions on either side of the Atlantic. About a century and a half later, a still more beneficial change—and that, too, arising from the mother-country's own disasters—was inaugurated in the colony. In 1808, under the pressure of French invasion, the monarchy, in the persons of the royal family, was virtually transferred from Portugal to B., an event which, doubtless through British counsels and influence, was immediately followed by the opening of the ports to foreigners. As a remoter benefit, too, of an incident which had no parallel either in English or in Spanish America, B., on shaking off, like its neighbors, the European yoke altogether, found a merely nominal revolution sufficient for its purpose, establishing, or rather accepting, an hereditary empire instead of restless and precarious republicanism; and ever since the transition-period of 1821–25, this consolidated government, with subordinate institutions for local objects, has secured to B.'s twenty vast provinces comparative unity and peace. A war was undertaken in 1865, in concert with the Argentine republic and Uruguay (formerly a province of B.), against Paraguay, which terminated in the defeat of the Paraguayans; and in 1872 Paraguay ceded to B., as a war-indemnity, the long-disputed territory comprised between the Paraguay and the Paraná, n. of the Apa and Icatim. This territory has an extent of about 16,000 sq. miles.

The executive authority is vested in the emperor, who, besides being aided by a council of state, must act through responsible ministers. The legislature consists of two chambers, which sit four months every year. Both the deputies and the senators, who must have annual incomes respectively of 800 millreas and 1600 are indirectly elected by voters, who must possess 200 millreas per annum—the former for four years, and the latter for life. The senate, however, appears to represent the crown as well as the people, inasmuch as each constituency merely nominates three individuals for his majesty's choice of one. Justices of peace, also, are appointed by the respective com-

munities; and in the courts generally, whether civil or criminal, there prevails trial by jury. The budget of 1878-79 gave a revenue of 103,300,000 paper millreas, and expenditure, 107,732,068 (the paper millrea is about half the value of the silver coin, which is about 2s.); the public debt in 1877 was 701,952,781 millreas—nearly £35,000,000. The standing army is fixed at 15,000 men on the peace-footing, and at 32,000 on the war-footing; and the standing naval force is fixed at 4000 men, which may be raised to 8000 in time of war. The navy in 1877 consisted of 56 vessels, including 53 steamers and 11 ironclads.

The population in 1872 amounted to 10,108,291 negroes, mulattoes, and Europeans, besides about 1,000,000 aboriginal Indians, who are here proportionally fewer than in most parts of South America. Of the total pop. 1,510,806 were slaves. The Africans continued to be imported till 1854, and their amalgamation with the Europeans produced perhaps the finest variety of the mulatto in the world. A law for the gradual emancipation of the slaves was passed in 1871. It enacts that henceforth the children born of slave women shall be "considered of free condition," but bound to serve the owners of their mothers for the term of 21 years, under the name of apprentices. Roman Catholicism is the prevailing religion. Notwithstanding the recent efforts of the legislature for the advancement of education, it is still very defective. In 1874, the attendance at the public schools was only 140,000.

But physically, as well as politically and socially, B. differs in many respects from most of the other divisions of the new continent. It knows nothing of the volcanoes and earthquakes of the Pacific coast; with winds blowing constantly from the Atlantic ocean, it is exempted from those droughts which are always blighting one or other of the slopes of the Andes, the remoter slope in Peru and Chili, and the nearer in Buenos Ayres and Patagonia; its mines, again, are as famous for gold and diamonds as those of the western Cordilleras for silver. In its hydrography, B. contrasts unfavorably with the other divisions. While the Amazon and the Plata, the Mississippi and the St. Lawrence—not to mention countless rivers of inferior magnitude on both shores—are for the most part practicable almost to their sources, the streams of B., with the exception of the Amazon, are mostly impeded throughout by cataracts and shallows, thus counterbalancing, as it were, its matchless seaward facilities by the deficiencies of its inland communications. Further, the most navigable of these streams, instead of entering the open sea, mingle their waters with those of the Plata or of the Amazon—the Parana and the Uruguay joining the former, and the Madera, the Tapajos, the Zingu, and the Tocantins, the latter; and even among those that do send their tribute at once to the ocean, a similar direction is sometimes impressed by the dividing ridges—the San Francisco, for instance, by far the largest of them, running to the northward parallel with the s.e. coast through 11° of lat., and leaving only 4° of long. for its remaining course to the Atlantic. A humid surface and a luxuriant vegetation conspire to render ordinary roads all but impassible. B. possessed, at the commencement of 1878, railways of a total length of 791 m., and it has also a system of telegraphs, the lines at the same date being 3875 m. in extent. Telegraphic communication has been established between B. and Europe; the first message was despatched by the cable to Lisbon, June 23, 1874.

Among the mineral treasures, besides gold and diamonds already mentioned, iron of superior quality is abundant; and salt, also, is extensively produced in saline marshes by the alternate processes, according to the season, of inundation and evaporation. The productions of the soil, which are, of course, equally various and rich, will be more satisfactorily considered under the heads of the respective localities. Suffice it to say, that the cotton is naturally excellent, and that the tea-plant of China has been introduced, though hitherto with indifferent success. The exports are necessarily different from the different sections of the country. From the n., they are coffee, cotton, cocoa, sugar, and tobacco; from the s., hides, tallow, horns, etc.; and from the middle, drugs, diamonds, gold-dust, dyes, rice, manioc, tapioca, spirits, and rosewood. Their total value in five years, 1873-77, averaged £17,500,000; the corresponding imports averaging £17,000,000. The chief centers of foreign trade, and, along with San Paulo in the interior, the principal cities of the empire, are Para, Maranhão, Bahia, Pernambuco, and Rio de Janeiro. This last-named port, which is likewise the seat of government, is the favorite halting-place of the outward-bound vessels for India, China, and Australia.

BRAZIL (*ante*) comprises 3,288,000 sq. m.; and the several islands adjoining in the Atlantic, the most important of which is Fernando Noronha, 250 m. e. from cape St. Roque, and the penal settlement of the empire. The boundaries of B. are sufficiently described, *ante*. The most striking physical feature of the country is the Amazon river, which with its numerous tributaries affords 30,000 m. of navigation within the territory of the empire. (See AMAZON.) Next in importance is the Tocantins river, which rises in the s. central part of the country, and flows directly n. for 900 m., uniting with the Para branch of the Amazon. The river Araguaya, parallel with and w. of the Tocantins, divides about midway in its course, and afterwards unites, inclosing between its two channels the remarkable Bananal island, 220 m. in circumference, and containing a lake 80 m. in extent. The Turyassu, Maranhao, and Paranahyba are the largest of the other rivers of the n.e. slope. The San Francisco occupies a wide inclosed basin of the eastern highland, and has a course n. and e. of 1800 m., navigable 160 m. from the ocean.

Further s. on the coast slope are the Paraguasu, the Rio de Contas, the Belmenti, the Rio Doce, and the Paranahyba do Sul, all of them to some extent navigable. The great rivers of the southern watershed are the Parana and the Paraguay (q.v.). The Parana rises in a broad basin which extends for 700 m. in width across s. Brazil. The Paraguay has its source in several small lakes between 13° and 14° s., taking in as it flows southward a number of large and small streams, and affording uninterrupted navigation through nearly its whole course, large steamers running up about 1000 m. in a direct line from Buenos Ayres, and smaller craft going 300 m. further. The other large rivers, such as the Xingu, Tapajos, Madeira, Purus, Jurua, Javari, Zapura, Negro, Jamuda, etc., are tributaries of the Amazon.

In respect to elevation, the surface of the country is divided into the higher regions of plateaus, ridges, and broad open valleys, occupying the whole of the country s. of the latitude of cape St. Roque, and the vast lowland plain of the Amazon, extending across the continent to the base of the Andes of Peru, Ecuador, and Colombia, rising in the extreme n. to the ranges which form the boundary of Venezuela and Guiana. The highest and most important mountains in B. are the Serra da Mantiqueira and the Serra do Espinhaço, between 18° and 23° s., and from 100 to 200 m. from the sea-coast. The highest peak has been estimated from 8900 to 10,300 feet. There is a coast range of mountains beginning n. of Rio Janeiro, and running both n. and s. not far from the ocean; but none of the peaks exceed 7500 feet. The remarkably even character of the great level of the river provinces may be known from the fact that where the Amazon enters B. at Tabatinga, more than 1500 m. in a direct line from the ocean, the river banks are not more than 250 ft. above sea-level. The rock formation of the mountains is chiefly gneiss. Clay-slates are found between the Parana and the Paraguay, and true carboniferous strata occur in the coal basins s. of the tropic. Carboniferous rocks occur, but Jurassic rocks do not appear. Coral reefs occur along the n. coast. The limestones of the upper San Francisco basin contain the celebrated bone caverns which have been described by Lund, the Danish naturalist. In some of these the remains of extinct animals of high antiquity have been found, such as those of the mastodon, mylodon, glyptodon, toxodon, and megatherium; and with these, stone implements and remains of man so buried with the bones of the extinct fauna as to lead to the conclusion that man was contemporaneous with them. There are no signs of recent volcanic action in B., but warm springs are found in several places, saline and alkaline, varying from 88° to 119°, the warmest at an elevation of 6000 ft. above the sea.

In minerals and jewels B. is very rich. Diamonds were found, in 1786, 300 m. n. of Rio, and at later periods in many other sections. The emerald, ruby, sapphire, topaz, beryl, tourmaline (black, blue, and green), amethyst, garnet, rock crystal, chalcedony, opal, agate, and carnelian are more or less plentiful. There are several large coal basins, and also sulphur, saltpeter, and salt. Gold is abundant in many of the provinces, always accompanied by silver. Silver alone was found in large quantities more than 200 years ago. There are rich mines of mercury not far from the capital; and copper, lead, iron, and manganese are also abundant.

The climate of this immense country is naturally widely varied. In the northern lowlands, between the tropics, it is very hot, with but two seasons in the year—the dry and the wet. In the higher lands it is milder, and in the extreme s. the four seasons are tolerably well marked. The wet season lasts from Dec. or Jan. until May or June, with occasional intervals of fine weather. The other half of the year is dry, but not without occasional showers. The amount of water in the wet season is enormous, often producing a rise of 40 ft. in the great rivers, and heavy rains are accompanied with abundant lightning and thunder. At Maranhao the annual rain-fall has been as high as 280 in., while at Rio Janeiro it is but 59 or .60 inches. Temperature is remarkably even, particularly in the Amazon basin. A record kept at Para between 1861 and 1867 showed the annual mean of 80° with extremes of 68° and 95°. The greatest ranges are in the central and southern tablelands and mountain ridges, where the coast temperature is hot and the air humid, while in the interior there may be snow and a little ice. The prevailing winds are the trades from the e., sweeping in the moisture of the Atlantic, and reaching inland along the whole valley of the Amazon to the Andes. These winds greatly mitigate the heat of the dry season. In the interior the course of winds is n. or s., blowing usually toward the sun. Along the ocean the usual interchanging land and sea breezes are of regular daily occurrence. Malarial fevers prevail in some of the low and marshy districts, but, as a whole, B. is a healthy country. There have been epidemics of cholera and yellow-fever; but the ordinary mortality of cities and towns compares favorably with that of European cities.

Vegetation in B. is wonderfully prolific. Except on the loftiest mountains and in some stony districts, the country is luxuriant with vegetable life. In the mountain passes, near the sea-shore, the joint effect of heat and moisture produces a growth beyond man's efforts to restrain. Trees cut and split for fences send forth shoots and branches immediately, and this whether the position of the fragments be that in which they originally grew, or inverted. Along the Amazon the loftiest trees destroy each other in consequence of near proximity. In the province of Maranhao roots of grasses and other plants extending from the shores of pools weave themselves into vegetable bridges, along which the wanderer treads, unaware that he has left solid land until he

sees the jaws of a cayman protruding through the herbage beneath him. Along the coast mangroves are numerous and prominent, and so rank is their growth that the seeds begin to sprout before they drop from the parent stem, while the drooping branches strike into the soil and take root. Behind the mangroves come the palms in great variety, while the underwood is chiefly crotons. Brushwood and herbage are seldom seen; everything tends to the gigantic in size. The most varied forms group awkwardly together, crossed and intertwined with leaves. The preponderance of trees with feathery foliage, and glossy, fleshy leaves, lends alternately a tender and luxuriant character to the scene, which in every other respect is painful from its monotony. Cocoa trees, the vanilla, the cinnamon tree, various kinds of pepper, and Brazilian cassia are found. Above the falls of the large rivers the vegetation is generally different; and so is that of the southern pampas or prairies. There are found beautiful flowers, and at intervals groves of small trees growing far apart, while solitary myrtles, fruit trees, and occasionally a cactus add variety to the prospect. The cactus is prolific on the hot steeps of Pernambuco, and the medicinal ipecacuanha flourishes in Terro do Mar. In the valley of the Paraguay there is a profusion of water plants, in one river so many and so strong as seriously to obstruct navigation. The cocoa tree is in abundance near the sea-shore; Brazil-wood, noted for its dyes and its value as timber, also grows near the sea. Besides these there are the rosewood tree, the trumpet tree, the soap tree, the laurel-pear tree, and abundance of palms. The carnauba palm is one of the most useful trees; every part is valuable, even the wax yielded by its leaves being an article of commerce. More important still is the caoutchouc, or india rubber tree, the gum of which exported from B. annually amounts to more than \$5,000,000. The banana tree furnishes the food of a great portion of the population. Other important fruits are the mango, pine-apple, custard-apple, guava, melons, and nuts.

Although not more than one acre in 200 in all B. is under cultivation, it ranks high as an agricultural country for some articles. The chief productions are coffee, sugar, cotton, manico or cassava flour, tobacco, rice, maize, fruits, and spices. Wheat and flour are imported from the United States.

The varieties of animal life in B. are probably more numerous than in any other part of the globe. Of beasts of prey the jaguar, or South American tiger, is the most formidable; besides this animal there are the tiger cat, the puma, the ocelot, the red wolf, and the Brazil fox or wild dog. Large herds of peccary roam in the forests, where also are tapirs, largest of South American animals. The water hog, abundant on the river banks, is the largest rodent. Various species of deer inhabit the plains. Of edentata there are several species of armadillos, the ant-eater, and the sloth; and of marsupialia there are many kinds of the opossum family all over the country. Of monkeys the variety is surprising; the largest belong to the genus stentor, and are known as howling monkeys. The simia jacchus is found in no other region. There are many species of bats; while of birds the variety is wonderful, from the ouira, an eagle far larger and more powerful than the most important of European birds of prey, to humming-birds not larger than humble-bees. Among larger birds is the rhea, a species of ostrich. Most birds of B. are noted for beauty of plumage. Red, blue, and green parrots haunt the tree-tops; pigeons in great varieties throng the woods; orioles resort to the orange groves; chattering manakins mislead the sportsman; and the metallic tones of the uraponga resound through the forests like the strokes of a hammer on an anvil. The toucan is prized for its feathers, which are of lemon and bright red color, with transverse stripes reaching to the extremities of the wings. One beautiful specimen of the humming-bird has the native name of the "enanthe engera," or "winged flower." Serpents are found in great varieties, the most venomous being the rattlesnake and the jararaca. Others, such as the boa, attain enormous size. There are also many varieties of annoying insects along the rivers; one of them, the puim, so small as to be nearly invisible, inflicting a painful and sometimes dangerous bite. The red ant is a destroyer of vegetation, and large districts are sometimes laid waste by its ravages. Spiders attain enormous size, but few of them are venomous. Butterflies are innumerable, and of the most surprising beauty. A dozen varieties of wild bees, most of them honey-makers, have been noted. Caymans and lizards abound. The supply of turtle in the Amazon and its tributaries appears inexhaustible. The sea and the streams abound in fish, among which naturalists have within the past few years found many hundreds of kinds before unknown. One of the largest, the pira rucu, is the principal food of large numbers of people along the Para and the Amazon. The more important domestic animals are the horse, ox, and sheep. Immense numbers of wild horses roam the great southern prairies, found generally in droves of 20 or 30. Cattle also roam wild, and are killed in great numbers for their hides, horns, and tallow, which form a large proportion of the exports of the country.

The population of B. presents a number of distinct types, as well as many varieties blended therefrom. In the eastern or maritime provinces the aboriginal Indians have, to a great extent, become amalgamated with the settled population; but in the great forests and plains of the interior, they are nearly all in a savage condition. In general description the Indians are copper-colored, of medium height, thick-set, broad-chested, and muscular, with small hands and feet, and well-shaped limbs; hair black, thick, and straight; features broad, cheek-bones not generally prominent; eyes black;

and sometimes oblique like those of the Chinese; in disposition apathetic and unemonstrative. Though considerably differing in different sections they appear to belong to one original stock, called the Tupi-Guavani. The only tribe that has almost entirely resisted the inroads of civilization is that of the Botocudos (q. v.), living in the forests of the Rio Doce, who are sunk in the lowest barbarism, and are fast dying out. From the mixture of the natives with Europeans, mainly with the Portuguese, are descended the Mamlucoes, who first became prominent in raids and conquests in the southern provinces. Negroes, originally from Africa, form a large proportion of the population; and from these and whites have sprung mulattoes of all shades. The B. creoles, who call themselves Brazilerios, descendants of these mixed races, are little inferior in capacity, physical strength, or intelligence to the true Portuguese. A great social reform was begun by the law enacted in Sept., 1871, providing that after the date of the act all children born of slave parents should be free, and that all slaves belonging to the state or the emperor's household should likewise be free; and the same law set apart an emancipation fund to be applied to the ransom of slaves owned by private persons. Since that time emancipation has gone on rapidly, the work having been greatly assisted by private philanthropy, and by many of the slaveholders themselves. The importation of slaves was forbidden in 1853, and since then more than a million persons have obtained their freedom. The rapid progress of emancipation after 1871 caused some difficulty in the supply of labor; but the ultimate effect has been to give new avenues for the employment of capital, promote internal improvements, and induce desirable emigration from Europe. Enterprises of all kinds have multiplied, and public instruction has received a vigorous impulse. Until after 1872, when a full census was begun, every estimate of the population of B. had been based upon the official returns of 1817 and 18. In the first census the total was put at 4,396,000; in 1850, a round number, 7,000,000; and in 1860, 8,000,000. In the following table for 1872 the figures for the provinces marked * are estimated on the best available knowledge; those not marked are the census figures:

POPULATION.

PROVINCES.	Sq. Miles.	Free.	Slave.	Total.	CHIEF TOWNS.
Alto Amazonas.....	753,469	56,631	976	56,610*	Manáos.

Totals.....	3,288,110	8,223,620	1,476,567	9,700,187	

The constitution of B., dating from Mar. 25, 1824, establishes four powers in the state—the legislative, the executive, the judicial, and the moderating power, or royal prerogative. Senators are chosen for life at electoral meetings specially convened, each of which nominates three candidates, leaving the choice of them to the sovereign or his ministers. A senator must be of native birth, 40 years old, and must have an annual income of \$800; there are 58 of them, and their salaries are \$1800 per annum. Members of the house, or congress, are elected for four years. The empire is divided into electoral districts, in which every 30 voters select one elector, and the electors, varying in number according to population, nominate a deputy from each district. The house is composed of 122 members. A voter must have an income of (about) \$112; an elector of \$225, and a deputy of \$450 per year. All registered voters must vote, or suffer a penalty. Minors, monks, and servants may not vote; and naturalized foreigners, and persons not of the state religion (Roman Catholic), are ineligible as deputies. The deputies have a salary of \$1200 per annum, besides traveling expenses. Sessions are limited to four months. Each house chooses its own officers, and at the opening and closing of a session both houses sit in a general assembly for the disposal of important business. For ordinary purposes, they sit separately. Taxation, provision for the army and navy, and, if it should become necessary, the choice of a sovereign, originate in the house of

* There are probably 1,000,000 Indians not taken into account.

deputies. The senate deals with offenses committed by members of the imperial family, and by senators and deputies if committed during the session, and is invested with the right of convoking the legislative assembly should the emperor fail to do so for two months after the period fixed by law. The executive power is in the sovereign, assisted by the ministers and a council of state. The ministers are responsible for treason, corruption, abuse of power, and all acts contrary to the constitution, or the liberty, security, and property of citizens; a responsibility from which they cannot escape on the plea of orders from the sovereign. The executive functions consist in the convocation of the ordinary meetings of the legislative assembly; the nomination of bishops, governors of provinces, and magistrates; the declaration of peace or war, and the general execution and superintendence of all measures voted by the legislature. The moderating power, vested in the sovereign, gives him authority not only to select ministers and senators, but to temporarily withhold his sanction from legislative measures, to convoke extraordinary sessions of the legislative assemblies, to dissolve the chamber of deputies, and to grant amnesty and pardon. There are 7 ministries—war, foreign, interior, marine, finance, justice and public works, agriculture and commerce. The ministers are assisted by a council of state consisting of 12 ordinary and 12 extraordinary members, all named by the emperor, and holding office continuously. They are usually ex-ministers. The heir to the throne, if of age, is by right a counselor of state. At the head of each province is a president appointed by the general government; and each province has its local legislature, or provincial chamber, called the legislative assembly of the province. The members of the latter are nominated by the electors who choose deputies to the national assembly, but the members of the provincial chambers are chosen directly by the electors for two years. The power of these provincial bodies over local affairs is analogous to that of the general assembly over affairs of the empire.

The Roman Catholic is the established religion, but all others are tolerated "with the domestic or private forms of worship in buildings destined for the purpose, but without the exterior forms of temples." No one can be persecuted for religious acts or motives. The Roman Catholic clergy are maintained by the state; but funds are also voted for the assistance of other sects. No ecclesiastical decree can have force without permission of the emperor or of the general assembly. Marriages of Protestants celebrated in foreign countries are respected. The empire constitutes an ecclesiastical province of the Roman see, with an archbishop, 11 bishops, 12 vicars general, and about 1300 curates. Public education is in three distinct divisions—primary, secondary, and scientific. The first is gratuitous, and "will become compulsory as soon as the government considers it opportune." Thus far it is very backward.

The trade and commerce of B. have rapidly increased within the past decade. In 1877, there were 1438 m. of railroad open for traffic, and 800 m. in course of construction. Telegraphs, though comparatively new, reported 3890 miles. There were at the close of 1876, 1018 post-offices, and 13,165,000 letters for the year. Weights and measures are those of the French metric system. The standard of value is the gold octava of 22 carats, equal to 4 milreis, or 4000 reis; value at the U. S. mint, \$2.18.

BRAZIL', a city in Clay co., Ind., on the St. Louis, Vandalia, Terre Haute, and Indianapolis railroad, 57 m. w.s.w. of Indianapolis; pop 70, 2186; in '80, 3530. There are coal and iron mines near the place, and the people are largely engaged in mining and manufacturing. There are six churches, two banks, four weekly newspapers, and a number of good schools.

BRAZIL', ISLAND OF, one of the mythical islands of the Atlantic set down by early cosmographers. The Arabic geography of Edrisi (middle of the 12th c.) describes several such islands, and in Mercator's atlas, 400 years later, the northern Atlantic (now known to be nearly clear of islands) is as full of islands as the sky is of stars. Among these mythical places were the isle of St. Brandon, said to have been discovered by the Irish in the 6th c., of which many wonders were told; the island of Anlilia; the island of the Seven Cities, said to have been the place of refuge of Christians flying from the Saracen conquerors of Spain; the island of Mayda, or Asmaide; and the isle Verde, behind which the inhabitants of the Hebrides imagine they see the sun disappear at setting. None, however, were more famous than the isle of Brazil, the name of which connects it with the red dye-wood of the same appellation. The island was assigned to several places, in one map being attached to the Azores, and finally getting the name of Terceira. The baseless tradition was not finally and officially exploded until the publication of the British admiralty charts of 1865.

BRAZIL CABBAGE, or CHOU CARAYBE, (*caladium sagittifolium*, or *xanthosoma sagittifolia*), a plant of the natural order *araceae*, nearly allied to *cocco* (q.v.), and very similar to it, although it differs in having arrow-shaped pointed leaves. It is supposed to be originally a native of tropical America, but is now in common cultivation throughout the whole tropics; not only the root being used for food like that of *cocco*, but also the leaves, boiled as greens. Both root and leaves are almost entirely destitute of the acridity so generally characteristic of the order.

BRAZILIAN GRASS, an incorrect popular name applied to a substance used in the manufacture of a very cheap kind of hats, known as B. G. hats, and also as *chip* hats.

It consists of stripes of the leaves of a palm, *chamærops argentea*, which are imported into Britain for this manufacture, and chiefly from Cuba. See **CHAMÆROPS**.

***BRAZILIAN PLUM.** See **HOG PLUM.**

BRAZIL NUTS are the seeds of the *bertholletia excelsa*, a majestic and beautiful tree of the natural order *lecythidaceæ* (q.v.). The tree grows to the height of 100 or 120 ft., and abounds on the banks of the Orinoco and in the northern parts of Brazil. It produces a round woody pericarp or seed-vessel, almost as large as a man's head, within which are many of the seeds or nuts. The pericarp is very heavy and solid, requiring a blow of a sledge-hammer to break it; and at the time when this great fruit is ready to fall, it is dangerous to walk under the tree. The seeds, which are popularly called nuts, and much resemble fruits of that description, are wrinkled and triangular, having a hard shell and a pure white kernel, which, when fresh, is very agreeable. They are chiefly exported from Para and French Guiana, and are well known in our shops. They yield a large quantity of oil, which is good for burning. The nuts or seeds of the *lecythis ollaris*, or **POT TREE**, are produced in a pericarp which resembles a rusty iron pot with a lid, the lid dropping off and letting the seeds out, which are oblong, grooved, and esteemed of a very superior quality to the common B. N.; but they have not yet become an article of commerce, as the tree grows chiefly in the interior parts of the country, from which the nuts are only occasionally sent to the coast.

BRAZIL WOOD, a dark-red or yellowish-brown dye-wood, which forms a considerable article of export from Brazil, where some of the trees which yield it are very abundant. It is the produce of different species of *caesalpinia* (q.v.). The best kinds are those called Pernambuco wood, all saints' wood, and St. Martha wood. Much of the B. W. of commerce is obtained from *caesalpinia Brasiliensis*, a tree which is a native of the West Indies, commonly growing in dry places and among rocks, and seldom exceeding 30 ft. in height. It has bipinnate leaves, with many smooth, obtuse, oblong leaflets, and no terminal leaflets, the flowers in panicles, with downy stalks. The heart-wood alone is of any value.—**PERNAMBUCO WOOD** is the produce of *caesalpinia echinata*, a prickly tree, with prickly pods, and of which the red and yellow flowers have a delicious smell, resembling that of the lily of the valley. The sap-wood is extremely thick, and the valuable heart-wood bears a small proportion to the whole diameter of the stem.—The sappan wood (q.v.) of the East Indies nearly approaches B. W. in quality. It is the produce of *caesalpinia sappan*, a small thorny tree.—The **BRAZILETTO WOOD**, sometimes also called B. W., which is brought from the Antilles, is much inferior. *Caesalpinia crista* probably yields some of the inferior West Indian Brazil wood.—It is a curious circumstance, that B. W. is said not to take its name from Brazil, but to be mentioned under the name *Braxilis* in documents much older than the discovery of America, the sappan wood of the East Indies being probably intended, and the name of Brazil has even been supposed to be derived from that of this product of its soil.

When freshly cut, the color of B. W. is yellow; but when exposed to air, moisture, and light, it becomes red, and is generally sent into market ground down to the size of ordinary sawdust. When treated with water, alcohol, or ether, the weathered B. W. readily yields up its red coloring matter, called *Brazelëin*. The latter is supposed to be produced from the oxidation of a colorless substance called *Brazilin*, which exists in the original yellow wood of the tree. Strong decoctions of B. W. are used by the dyer and calico-printer in the fabrication of reds, browns, etc.; it is also used in the manufacture of red ink. See **INK**.

BRAZING, or **BRASS SOLDERING**, is the process of uniting together two pieces of brass, two pieces of copper, or one of each, by means of a hard solder, partaking more or less of the composition and properties of ordinary brass. The edges or parts of metal to be joined are first filed bright, so as to be thoroughly clean, then there is strewed over the gap or crevice a mixture of the solder and borax. The solder employed varies in composition according to the kind of work, and may be rendered more fusible by the addition of a larger amount of zinc, but the general proportions are (1) 16 copper, 16 zinc, and 1 tin; (2) 12 brass, 4 zinc, and 3 tin; or (3) 18 brass, 3 zinc, and 2 tin. When the whole has been fused together, it is allowed to cool, and is then filed down to a coarse powder, in which state it is used. The borax is employed to form a glaze over the brightened surfaces, and thus prevent the oxidation of the metal, which would seriously interfere with B., and even stop the operation. An outward coating or layer of charcoal is likewise serviceable in the exclusion of the air during the B. of large pieces of metal. Where a very high heat is required in the process, a little powdered glass is mixed with the borax. The mixture of solder and borax may be applied dry, but it is better to moisten it with water, and to lay it on the filed surfaces with a spoon. The whole is then gently heated, when the water evaporates and leaves a crust of borax and solder. The work may now be strongly heated before the blow-pipe, or over a clear fire, and at a bright red heat the solder fuses, and the zinc begins to burn with a pale-blue flame. At this stage, the solder *flushes* or becomes liquid enough to permeate the joint or crevice; but should it be tardy in acting thus, several slight taps will insure the proper result. The whole is now cooled, and, towards the close, the articles may be introduced into cold water for more rapid reduction in temperature. Pieces of metal which have undergone the process of

B. are so firmly united that they may be rolled and re-rolled without the parts yielding. See **SOLDER**.

BRAZORIA, a co. in s.e. Texas on the gulf of Mexico; 1260 sq. m.; pop. '70, 7527—5736 colored. The International and Great Northern railroads intersect the county. It has a level surface of oak forest and prairie. Agriculture is the main occupation. Co. seat, Brazoria, 48 m. s. of Houston.

BRAZOS, a co. in s.e. Texas, on the B. river; 578 sq. m.; pop. '70, 9205—3759 colored. The surface is undulating and fertile; chief business, agriculture. The Houston and Texas railroad traverses the county. Co. seat, Bryan.

BRAZOS DE DIOS, a river of Texas, North America, the second, if not the first, in magnitude that flows within the state. It runs towards the s.e., rising in the table-land of Bexar co., and falling into the gulf of Mexico about 40 m. to the s.w. of Galveston. With a course of about 900 m., it is navigable at all times to a distance of 40 m. from its mouth, and at certain seasons to a distance of 300 miles. The valley of the river, the lower half being merely an alluvial plain, presents extensive forests, interspersed with plantations of maize, sugar, and cotton.

BRAZOS DE SANTIA'GO, a port of entry in Cameron co., Texas, on the gulf of Mexico, 35 m. e.n.e. of Brownsville. It has some foreign and considerable coasting trade.

BRAZZA, an island in the Adriatic, belonging to Dalmatia, Austria, in lat. 43° to 44° n., and long. 16° to 17° east. It has an area of about 170 sq. m., and a pop. of 16,000; and is separated from the mainland by a channel of some 8 or 10 m. in breadth. Its surface is mountainous, and extensively wooded; vines, yielding excellent wine, are grown in the valleys, and figs, saffron, almonds, and oil are produced in considerable quantities, but not much grain is raised. Bees and silk-worms are reared in large numbers. B. is also celebrated for its cheese, and the delicacy of the flesh of its lambs and kids. Excellent building-stone, which is largely exported, is found in the e. part of the island. St. Pietro di Brazza is the chief town.

BREACH, in siege-works, is a gap in any of the defensive walls or gates of a city; and *breaching* is the operation by which the gap is produced by the guns of the besiegers. *Breaching batteries* are employed, consisting of several pieces of ordnance, so chosen as to kind and size, and so placed as to distance, as to burst a hole through the defenses in the shortest practicable time. The greatest effect is produced by lodging the balls in two vertical lines, from the parapet of the wall downwards, and in a horizontal line, connecting the lower ends of those vertical lines; and then overturning the mass of material thus loosened by an irresistible salvo or volley. When a hole has once been made, by thus knocking away the masonry or earthwork, the breaching is continued until the crumbling mass has so accumulated as to form a practicable slope, up which the storming-party of the besiegers may run. See **ASSAULT**. During the Peninsular war there were some formidable examples of breaching. At Badajoz, 14,000 shot brought down 180 ft. of wall in 104 hours, from a distance of 450 yards. At Ciudad Rodrigo, 6700 balls brought down 105 ft. of wall in 32 hours, from a distance of 560 yards. At St. Sebastian, 13,000 shot brought down 100 ft. of wall in 62 days, from a distance of 620 yards. It was calculated, from these and other instances, that 10,000 24-lb. shot, or 240,000 lbs. of iron, will breach 100 ft. of wall from a distance of 500 yards—the wall being of fair average masonry, and the height and thickness a fair average of those used in fortified towns. It must be remembered, however, that this estimate was made before the days of rifled cannon and Armstrong guns; and, on the other hand, that the walls adverted to were not constructed of granite.

BREACH, in law, signifies a breaking or violation of a right or of an obligation or engagement legally binding; and in this sense it has numerous applications, of which the following are those more particularly treated in law-books:

BREACH OF ARRESTMENT, in the practice of the Scotch law, is the disregard or violation of the process of arrestment, or attachment, by the arrestee, or party in possession of the arrested or attached property, but who, notwithstanding, pays the sums or delivers the goods arrested; and such B. is viewed by the courts as a contempt. But at present the only consequence of the B. is, that the person guilty of it, where it is a question as to *money*, is liable in damages to the extent of the funds paid away, and the costs. Where goods are arrested, and the arrestment is removed on bail (or "loosed on caution," as the Scotch lawyers say), if the goods themselves cannot be recovered, or their value cannot be clearly ascertained, the surety or "cautioner" is held to be liable for the original debt. See **ARRESTMENT**. In England, the disputing or disobeying a rule, or order by a judge for attachment of a debt very nearly means the same thing. See **ATTACHMENT**, **GARNISHÉE**

BREACH OF CLOSE is a trespass by which an unwarrantable entry is made on another man's land, for satisfaction of which injury an action will lie to recover damages. It is called a trespass for breaking a man's *close*, because every man's land is, in the eye of the law, inclosed and set apart from his neighbor's; and that either by a visible and

material fence, as one field is divided from another by a hedge; or by an invisible boundary, existing only in the contemplation of the law, as when one man's land adjoins to another's in the same field. The liability to this injury attaches not only to the party himself trespassing, but also to trespass by his cattle. And the law gives the party injured a double remedy in this case, by permitting him to distrain the cattle till the owner shall make satisfaction, or else by leaving him to the ordinary remedy by action for the damage done.

But in some cases this trespass is justifiable; as where it is done in exercise of a right of way, right of common, or the like; or where a man comes to demand or pay money payable on the particular land; or to execute, in a legal manner, the process of the law; or by the license of the plaintiff himself. Also, a man may justify entering into an inn or public-house without the leave of the owner first specially asked; because when a man professes the keeping of such an inn or public-house, he thereby gives a general license to any person to enter his doors. So a landlord may justify entering to distrain for rent; and a reversioner to see if any waste be committed on the estate, for the apparent necessity of the thing; and it has been held that the common law warrants the hunting of ravenous beasts of prey, as badgers and foxes, in another man's land, if no greater damage be done than is necessary, because the destroying such creatures is said to be profitable to the public. But in cases where a man misdemeanors himself, or makes an ill use of the authority with which the law intrusts him, he is accounted a trespasser *ab initio*; as if one comes into a tavern, and will not go out in a reasonable time, but remains there all night, contrary to the inclinations of the owner; such wrongful act is held to affect and have relation back even to his first entry, and make the whole a trespass. But a bare nonfeasance, as not paying for the wine he calls for, will not make him a trespasser, for this is only a B. of contract. See Blackstone and Stephen's *Com.* respecting "civil injuries."

In the Scotch law, the term *close* is not used, and not known—but there any violation of a right of property in land may be redressed by legal process, and in many cases form the ground of an action for the recovery of damages. See CLOSE. The term *inclosure*, in Scotch law, has a different meaning, although the penalties for breaking such inclosure are somewhat analogous to those for breach of close. See below, BREAKING INCLOSURE, and see TRESPASS.

BREACH OF COVENANT is one of those civil injuries by which is meant a violation of a covenant or agreement contained in a deed of conveyance, either to do or omit to do something, and which B. gives a right of action against the party who made the covenant and his representatives. See COVENANT.

BREACH OF CONTRACT is a general description of injury, by which is understood the violation of any contract or legal engagement, and for which, at law, damages may be recovered, according to the nature of the breach and character of the contract. In 1854, jurisdiction was conferred upon the courts of common law, by which a plaintiff can compel a defendant to fulfill any actual duty. But till the constitution of the new high court of justice in 1873, it was only in the courts of equity that complete relief was given by enforcing the specific performance of contracts. See CONTRACT; DAMAGES; SPECIFIC PERFORMANCE; EQUITY, COURTS OF; CHANCERY, COURT OF.

In Scotland, although there is no distinction between law and equity, the remedy for this injury is very much the same. The party wronged may either conclude for damages, or *ad factum prestandum*, or for both these remedies.

BREACH OF DUTY may be legally defined as either the non-execution of an office, or the performance of it in such a way that the conditions on which it is undertaken are violated. Such misconduct may either violate the conditions of an express contract, or it may be equally opposed and do equal violence to any implied engagement or *assumpsit*, as it is technically called in the law of England, not from the express determination of any court or the positive directions of any statute, but from natural reason and the just construction of law, which assumes and intends that every man has engaged what his duty or justice requires at his hands. And he must do this with integrity, diligence, and skill; for if, by his neglect, injury accrues to individuals, they have their remedy against him in damages. See CONTRACT, DUTY, OBLIGATION, DAMAGES, EQUITY, PERFORMANCE OF CONTRACTS.

BREACH OF THE PEACE is an offense against the public tranquillity and safety, and is either felonious or not felonious. But the law on this subject will be best considered under PEACE, OFFENSES AGAINST THE PUBLIC.

BREACH OF POUND is an indictable offense, and means the breaking any *pound* (q. v.) or place where cattle or goods distrained are deposited, in order to rescue them. When once impounded, such goods or cattle are understood to be in the custody of the law, and an action for treble damages will lie for illegally taking them out of pound upon a distress for rent. Further, it is enacted by the 6 and 7 Vict. c. 30, that if any person shall release, or attempt to release, cattle lawfully seized by way of such distress, from the pound or place where they shall be impounded, or on the way to or from such pound or place, or shall destroy such pound—he shall be liable to a penalty not exceeding £5, and in default, may be committed to the house of correction. See Stephen's *Com.*, vol. iii., and see DISTRAIN, DISTRESS, POUND.

BREACH OF PROMISE TO MARRY. See PROMISE and MARRIAGE.

BREACH OF THE PEACE (*ante*), in general any riotous behavior, or annoying conduct, such as fighting, shouting, disturbing others assembled or singly, etc. In common practice almost any conduct that can be called "disorderly" is in some sense a B. of the P. Unless occasioning some serious revolt, a B. of the P. is only a misdemeanor.

BREACH OF TRUST. See TRUST.

BREAD. The earliest and most primitive way of making B. was to soak the grain in water, subject it to pressure, and then dry it by natural or artificial heat. An improvement upon this, was to pound or *bray* the grain in a mortar or between two flat stones, before moistening and heating, and from this *braying* operation some etymologists propose to derive the word *bread* (as if *brayed*). A rather more elaborate bruising or grinding of the grain leads to such simple forms of bread as the *oat-cakes* of Scotland, which are prepared by moistening oat-meal (coarsely bruised oats) with water containing some common salt, kneading with the hands upon a baking-board, rolling the mass into a thin sheet, and ultimately heating before a good fire, or on an iron plate, called a girdle, which is suspended above the fire. In a similar manner, the barley-meal and peas-meal *bannocks* of Scotland are prepared; and in the East Indies (especially the Punjab and Afghanistan), as well as in Scotland, flour is kneaded with water, and rolled into thin sheets, as *scones*. The *passover cakes* of the Israelites were also prepared in this way. A similar preparation of wheat-flour, but where the sheet of dough is made much thicker, forms the *dampers* of Australia. The Indian corn-meal, kneaded with water and fired, affords the *corn-bread* of America. The kinds of B. referred to above are designated *unleavened*, as no leaven has been added to the dough to excite fermentation. Even in the time of Moses, however, *leaven* was employed in making bread. It is held probable that the Egyptians were the first to use leaven; that the secret afterwards became known to the Greeks; and that the Greeks communicated the process to the Romans, who spread the invention far and wide in the northern countries during their campaigns.

The grain of wheat is generally employed in the manufacture of B. among the better classes and more advanced nations, though rye, barley, Indian corn, and rice are also extensively used. The average composition of the grain of wheat when dried, so as to evaporate about 14 per cent of moisture, is—

Gluten and albumen.....	13½
Starch.....	54½
Gum, sugar, oil, and fiber.....	30
Saline matter.....	2

The proportion of these ingredients varies, however; and though the native country of wheat is unknown, yet it is found that within the wheat zone (see WHEAT), the quality improves as we travel south. Thus, Scotch wheat is inferior to English, the latter to French, that to the Italian; and the finest wheat in the world is grown in Barbary and Egypt. The principal constituents of wheat may be separated from each other without much difficulty. Thus, if wheat-flour be placed in a cloth-bag with the mouth well closed, and the whole introduced into a basin of water, and pressed by the fingers for some time, the starch is squeezed through the cloth as a fine white powder, and the gluten is left in the cloth as a viscid or sticky substance. Again, if wheat-flour be burned on a porcelain plate on a fire, or oven, or gas-lamp, till it can burn no longer, it leaves behind a small amount of ash or saline matter.

Previous to being employed in the fabrication of B., the grain of wheat undergoes the process of *grinding*, with the double object of reducing it to a fine state of division, and separating the more hard and indigestible parts. See MILL. During the grinding operations, the wheat as it passes from grain to flour nearly doubles its bulk. The products come from the dressing-machine divided into different qualities, a quarter of wheat yielding—

	Bushels.	Pecks.
Fine flour.....	5	3
Second flour.....	0	2
Fine middlings.....	0	1
Coarse middlings.....	0	0½
Bran.....	3	0
Twentypenny.....	3	0
Pollard.....	2	0
	14	2½

In the making of B. in Great Britain, the finest flour is employed in making *firsts* or the *fine 4-lb. loaf*; a coarser flour is made into *seconds* or household B.; and a still coarser into *thirds* or coarse bread. There is no bran in *firsts*, but a greater or less proportion of the finer bran in *seconds* and *thirds*. In the making of good B. three things are absolutely requisite: flour or meal, yeast or leaven, and water containing salt. The yeast (q. v.), or leaven (q. v.), is added to give a start to the fermentation (q. v.) process, thereby supplying carbonic acid, which communicates a spongy or light texture to the bread. Leaven is the more primitive ferment, and is simply a portion of moistened

flour or dough in which the putrefactive agencies have begun to work. It may be produced by allowing moistened flour to lie in a warm apartment (summer heat) for six or eight days, and when sufficiently formed, has an acid taste and reaction, and a somewhat fusty odor. When brought in contact with a new portion of flour and water, and incorporated therewith by kneading, it very quickly acts as a ferment, and develops partial fermentation in the whole. Hence it is that where leaven is used, it is customary to retain a portion of the leavened dough for the next baking. On the continent, leaven is still very extensively employed, especially in districts far from breweries. In Britain, yeast is generally used as the ferment.

The materials being at hand, and the proper benches, utensils, and oven being within reach, the baker takes a quantity of water and adds to it the yeast and salt; after which the flour is added, and the whole thoroughly and laboriously kneaded together till it assumes a ropy consistence. It is then called the *sponge*, and is placed in a kneading-trough in a warm place, which is styled *setting the sponge*. In a short time, the yeast begins to act on the gluten, starch, and sugar of the flour, compelling the latter to pass into alcohol and carbonic acid gas in every part of the dough, which thereby becomes inflated with innumerable air cavities. When the fermentation has sufficiently advanced, the baker takes the sponge, adds more flour, water, and salt, and a second time subjects the whole to a thorough process of kneading, to prevent portions being so far fermented as to become *sad*, and again allows the mass to lie in a warm place for a few hours. The dough swells considerably from distension by gas, and is weighed out into lumps of the proper size, which are shaped into loaves, constituting the *batch*, or placed in tin pans, and are allowed to lie for a short time till they get further distended. The oven has previously been heated by flues, by heated air, or by wood being burned within it, to a temperature of at least 320° F., which is the lowest temperature at which B. can be baked, and ranging up to 572° F.; and when it has been thoroughly cleaned out, the loaves are introduced and placed on the floor, and the oven shut up. The heat acts in dissipating much of the water from the dough, in distending the air cavities more fully, and in partially *boiling* the starch and gluten of the dough, and developing some gum from the starch. Indeed, though the temperature of the oven is much higher, yet the loaves beyond the mere crust are bathed in an atmosphere of steam, and are never heated above 212°, as has been proved by direct experiments with the thermometer. One effect of the heat is to arrest any further fermentation (q.v.; see also YEAST). After several hours' baking in the oven, the length of time being determined by the temperature, the loaves are withdrawn, and allowed to cool. The brown appearance of the crust of loaves, and the pleasant taste of the crusts, are due to the action of the heat on the starch and the formation of dextrine (q.v.), a sort of gum. The number of quartern (4 lb.) loaves which a sack of flour weighing 280 lbs. yields, is 90. It will be apparent, therefore, that as 280 lbs. of flour yield 360 lbs. of B., that a good deal more water must be present in the latter than in the former; and indeed, ordinary good wheaten B. contains about 45 per cent of water. This water is retained even after the loaf is apparently dry, and even mealy, as the gum and gluten have a great affinity for water.

Improvements in the process of making B. are occasionally effected. Thus a form of yeast, called German barm or yeast (q.v.), has been introduced, which is more cleanly than ordinary yeast or leaven, but appears to be too rapid in its power of causing fermentation to be manipulated easily in the making of ordinary loaves, though it does well for pan-loaves and fancy B. in general. Ovens heated by flues are being constructed, instead of the primitive method of heating them by wood, which smokes the whole oven. Instead of raising the dough by the action of yeast, which decomposes a part of the flour and causes the loss of about 2 per cent, bicarbonate of soda and hydrochloric acid are sometimes employed. The proportion by this process are 4 lbs. of flour intimately mixed with 320 grains of bicarbonate of soda: to this is added a mixture of 300 grains of common salt in 35 ozs. of water and 6½ fluid drams of hydrochloric acid, sp.gr. 1.16, and the whole is kneaded and placed in the oven. When the mixture is made, the acid acts on the bicarbonate of soda, forming common salt, which is left in the dough, and carbonic acid is liberated at every point, and communicates a spongy texture to the dough. The disadvantage attendant on this mode of raising the dough is that it is apt to leave too much common salt in the bread. This is obviated by using water charged with carbonic acid, as described under AERATED BREAD. Sesquicarbonate of ammonia is employed to some extent in the preparation of rusks, gingerbread, and other light fancy B.: when heated, it entirely passes into gas, and thus yields a very spongy mass. *Short-bread* is prepared from flour which has been incorporated with butter. See UNFERMENTED BREAD.

The appearance which good wheaten B. ought to present, is that of a vesicular or spongy mass, from which layers can be readily detached; and this, known to bakers as *pled B.*, is the best index of good wholesome and easily digested bread. When the layers cannot be detached, and the loaf cannot be crumbled down by the fingers into a coarse powder, or the fragments be thoroughly soaked and be readily diffused through water, but become a permanent tough mass of dough, the B. is imperfectly made.

Rye B. is very extensively used in northern European countries, where the soil being sandy is admirably adapted for the growth of that grain. It yields a flour darker than

wheat-flour. It is almost equal in nutritive value to wheaten bread. Barley and oats, which when used as B. are generally made into cakes or bannocks, possess also a composition not unlike wheat. Indian corn, which thrives luxuriantly on the American soil, and is largely used there for B., as also to a considerable extent in the old world, is little different from wheat in the proportion of its ingredients. Rice is occasionally employed in making B., but it is not nearly so nutritious as wheat.

But although, with the exception of rice, the various kinds of grain do not sensibly differ in the amount of nutritious matter contained in the meal, yet there is a great difference as to the quality of yielding a light, spongy bread. In this respect, the flour of wheat excels all others. This quality seems to depend upon the mechanical structure of the gluten of wheat, which gives a glutinous, sticky consistency to the dough, rendering it impervious to the carbonic acid gas formed in it during the fermentation, so that the gas thus imprisoned swells it up. The meal of other grains forms a more granular and less tenacious dough, which allows the gas to escape with more or less ease as it is formed. It is thus impossible to make a light, spongy loaf of oatmeal, however finely it might be ground. In the case of whole-meal B. or brown B., the rough, hard particles of the bran interfere with the ordinary tenacious quality of wheaten-flour, and make the dough slightly porous, so that much of the gas escapes, and thus this kind of B. is never so much raised as B. of fine flour.

BROWN, COMPOSITION, or WHOLE FLOUR B. is made from the ground but undressed wheat, and therefore contains the bran as well as the flour. Some years ago it was suggested, that as the bran contained more nitrogenized matter than the flour, the whole meal must be more nutritious than the finer flour alone. But that opinion is now considerably modified; for while it is true that the whole meal (bran and fine flour) contains chemically more nutritive matter than the fine flour alone, yet the gritty particles that are present in the former, cause an unnatural irritation in the alimentary canal, and lead to a quicker evacuation of the but partially digested and absorbed food. This explains why brown B. possesses laxative properties, and why laborers fed on it consider that it makes them hungry soon again; they feel that it does not last in the stomach, and consequently think it has little nourishment in it.

The *adulterations* of B. are various. Very commonly boiled potatoes are added to the flour and water in the making of the dough, and some consider that this yields a lighter and more palatable bread. It must be remembered, however, that the addition of any substance of a nature foreign to the composition of any material is an adulteration (see next article); and that though potatoes may be supposed to improve the B., yet good B. can be made without them, and the addition of the potatoes lessens the nutritive value of the wheat-flour. Alum is occasionally added to the dough, to increase the whiteness and improve the general texture of the B.; and this it appears to do by arresting the passage of the starch into gum and sugar, which tends to take place during the process of baking. In Belgium, sulphate of copper is often used for a similar purpose, but it is not employed in this country. All such admixtures are destructive of the nutritive value of a certain part of the B., and are injurious to the animal system. For the nutritive qualities of B. see **NUTRITION and FOOD**, and for biscuit-bread, see **BISCUIT**.

The *law* on the subject of bread, so far as relates to England and Scotland, is regulated by a local act for London, the 3 Geo. IV. c. 106, the provisions of which are imitated by a general act for the country, the 6 and 7 Will. IV. c. 37. These provisions are as follow: B. may be made of flour or meal of wheat, barley, rye, oats, buckwheat, Indian corn, pease, beans, rice, or potatoes, or any of them, or with any common salt, pure water, eggs, milk, barm, leaven, potato or other yeast, and mixed in such proportions as bakers may think fit, and with no other ingredient or matter whatsoever; and with the exception of French or fancy B. and rolls, the B. so made must be sold by weight, and in no other manner. It has been settled by many recent cases that bakers must weigh the bread before selling it, whether asked by the customer or not to do so. For this purpose, they must provide in their shops, on or near the counter, a beam and scales, with proper weights, or other sufficient balance, in order that the same may be weighed in the presence of purchasers—a regulation that also applies to delivery of B. by cart or other conveyance; it being directed that the scales and weights shall be constantly carried in the cart or other conveyance, under a penalty, in either case, not exceeding £5. From this regulation, however, fancy B., or French B., or rolls, are also excepted. The act further provides that B. made of mixed meal or flour—that is, B. made wholly or partially of pease, or beans, or potatoes, or of any sort of corn or grain other than wheat—shall be marked with the large Roman letter "M," under a penalty, in case this rule be neglected, of a sum not exceeding 10s. for every pound-weight of such mixed B. sold, and so on in proportion for any less quantity. From this regulation, however, is excepted B. made of the meal or flour of wheat, in the making of which potato-yeast shall be used.

The following are the enactments against the adulteration of B.: 1. No baker shall, in the making of B. for sale, use any mixture or ingredient whatsoever other than those above mentioned, under a penalty for every offense not exceeding £10, nor less than £5, with the alternative of imprisonment, with or without hard labor, for any time not exceeding six calendar months; and the offender's name, place of abode, and offense may be published in the local newspapers. 2. Any person adulterating corn-meal or

flour, by the introduction of any ingredient not being the real produce of the corn or grain; or any person selling meal or flour of one sort of corn or grain as the meal or flour of another sort, whether separate or mixed, shall forfeit and pay, according to the discretion of the magistrate or justice, a sum not exceeding £20, nor less than £5. 3. Magistrates or justices of the peace, and also peace-officers authorized by warrant, may, at reasonable times in the daytime, enter a baker's premises, and search for adulterated flour or B.; and if any be found, the same may be seized, and carried with all convenient speed to the nearest resident magistrate or justice of the peace, to be disposed of as he may think proper, the penalties varying from £2 to £10, with alternative imprisonment for six months; the offenders' names may also be published. Parties obstructing such search of bakers' premises, or upon the occasion of the search, carrying away the adulterated flour or B., are liable to a penalty not exceeding £10. Should it, however, appear that any offense against the act shall have been occasioned by the willful act or the neglect of the baker's journeyman or other servant, the magistrate may issue his warrant for bringing such servant before him, and, on conviction, may adjudge him to pay a reasonable sum to his master, by way of recompense. The adulteration of food acts gives a more efficient mode of prosecuting these offenses, and exposing them, when detected.

The act further provides that bakers shall not bake bread, rolls, or cakes, on the Lord's day; or, on any part of that day, after half-past one o'clock in the afternoon, sell such bread, rolls, or cakes; or bake meat, pies, or other victuals; or in any other manner exercise the trade of a baker, save and except so far as may be necessary by way of preparation for the following day's baking. For a first offense against this regulation, a penalty of 10s. shall be paid; for a second offense, 20s.; and for a third and every subsequent offense, respectively, the penalty of 40s., together with the costs of prosecution, a portion of the penalty to be paid to the prosecutor, and the residue to be applied towards the poor-rate of the place. This regulation as to Sundays does not extend to Scotland.

The law of Ireland on the subject of this article is contained in several acts of the Irish parliament, the leading provisions of which are similar to the above.

BREAD, ARMY. In camps and in barracks of any size, the bread for the army is baked on the spot by bakers of the supply sub-department of control organization. Though perhaps a little rough in its manufacture, the article supplied is made from the best ingredients, and is genuine and wholesome. On a march, the control bakeries supply bread at the several halting-places. In smaller barracks, bread has to be obtained by contract, but the most vigorous supervision is exercised to secure proper quality. Formerly, army bread was notoriously bad. A contractor would sometimes send in a tender so low, in order to obtain the contract, that he could not possibly make good bread at a profit; and then he relied on small fees paid him by the soldiers as a means of obtaining better. This discreditable state of things was ascertained by a committee of inquiry some years ago; it was found that the average of army bread was not equal in quality to that of work-house bread. Steps were forthwith taken to remedy the evil; experiments were made to determine whether troops could bake their own bread in the field, and the result was the adoption of the present system of army baking. With the improvement of the bread, a visible amelioration in the health of the soldiers has taken place.

BREAD-FRUIT TREE, *Artocarpus incisa*, a tree of the natural order *artocarpaceæ* (q.v.), a native of the islands of the Pacific ocean and of the Indian archipelago—one of the most important gifts of nature to the inhabitants of these regions, its fruit supplying the principal part of their food, and its inner bark a considerable part of their clothing, whilst its timber and its milky juice are also employed for economical purposes. The genus to which it belongs (*artocarpus*, Gr., bread-fruit) is distinguished by having the male flowers in catkins, with a 2-leaved perianth and one stamen; the female flowers naked; the fruit roundish, fleshy, and tuberculated. The bread tree is a rather slender tree, of 40 to 50 ft. high, often rising almost half its height without a branch. It has large, pinnatifid leaves, frequently 12 to 18 in. long, dark green, and glossy. The fruit is generally oval, or nearly spherical, and about the size of a child's head. It is a *sorosis*, a compound or aggregate fruit formed from numerous flowers on a common axis, and is covered with a roughish rind, which is marked with small square or lozenge-shaped divisions, having each a small elevation in the center; is at first green; when imperfectly ripened, brown; and when fully ripe, assumes a rich yellow hue. It is attached to the small branches of the tree by a short thick stalk, and hangs either singly or in clusters of two or three together. It contains a somewhat fibrous pulp, which, when ripe, becomes juicy and yellow, but has then a rotten taste. At an earlier stage, when the fruit is gathered for use, the pulp is white and mealy, and of a consistence resembling that of new bread. In a still less mature state, the fruit contains a tenacious white milk. The common practice in the South Sea islands is to cut each fruit into three or four pieces, and take out the core; then to place heated stones in the bottom of a hole dug in the earth; to cover them with green leaves, and upon this to place a layer of the fruit, then stones, leaves, and fruit alternately, till the hole is nearly filled, when leaves and earth to the depth of several inches are spread over all. In rather more than half an hour, the bread-fruit is

ready; "the outsides are, in general, nicely browned, and the inner part presents a white or yellowish cellular pulpy substance, in appearance slightly resembling the crumb of a wheaten loaf." It has little taste, but is frequently sweetish, and more resembles the plantain than bread made of wheat-flour. It is slightly astringent, and highly nutritious. Sometimes the inhabitants of a district join to make a prodigious oven—a pit 20 or 30 ft. in circumference, the stones in which are heated by wood burned in it, and many hundred bread-fruits are thrown in, and cooked at once. Baked in this manner, bread-fruit will keep good for several weeks. Another mode of preserving it is by subjecting it in heaps to a slight degree of fermentation, and beating it into a kind of paste, which, although rather sour, is much used when fresh bread-fruit cannot be obtained. There are numerous varieties of the bread tree in the South Sea islands, and they ripen at different seasons. The tree produces two, and sometimes three, crops a year. In the West Indies and South America, into which it has also been introduced, the bread-fruit has not come much into use as an ordinary article of food; but various preparations of it are reckoned delicacies.—The fibrous inner bark of young bread-fruit trees, beaten and prepared, is used for making a kind of cloth, which is much worn by the common people in the South Sea islands, though inferior in softness and whiteness to that made from the paper mulberry (see MULBERRY, PAPER).—There exudes from the bark of the bread tree, when punctured, a thick mucilaginous fluid, which hardens by exposure to the air, and is used, when boiled with cocoa-nut oil, for making the seams of canoes, pails, etc., water-tight, and as bird-lime.—The timber is soft and light, of a rich yellow color, and assumes, when exposed to air, the appearance of mahogany. It is used for canoes, house-building, furniture, and many other purposes. It is durable when not exposed to the weather.—The JACK (q.v.) or JACA (*A. integrifolia*), and the DEPHAL (*A. lakoocha*), both large East Indian trees, belong to the same genus with the bread-fruit tree.

BREAD-NUT, the fruit of *brosimum alicastrum*, a tree of the natural order *artocarpacææ*, and therefore allied to the bread-fruit, a native of Jamaica. The genus *brosimum* is distinguished by male and female flowers on separate trees, in globose catkins, with peltate (shield-like) scales for perianth, and the fruit a one-seeded drupe. The bread-nut tree has ovate-lanceolate evergreen leaves; it abounds in a tenacious gummy milk. Its leaves and young shoots are much eaten by cattle, but deleterious qualities are developed in them as they become old. The nuts, boiled or roasted, form an agreeable article of food, and are eaten instead of bread. Their taste resembles that of hazel-nuts.—To this genus the *palo de vaca*, or COW TREE (q.v.), of Demerara is supposed also to belong.

BREAD-ROOM. In the navy, the biscuits are called *bread*, and the place where they are stored is the bread-room; it is carefully constructed, warmed before being filled, and kept as much as possible free from damp.

BREAD-ROOT. See PSORALEA.

BREADTH, in art, is a term which, though often used in a very indefinite manner, is not without a definite meaning. It signifies that peculiar disposal of the background of a picture which, without sacrificing or even concealing details, gives to the whole unity and harmony of effect. With the older landscape-painters, it was a common fault to produce the effect of distance either by a certain trick of light and shadow, or by one uniform hazy color in which the individual objects were entirely lost to view, and *breadth became vacancy*. In this respect, their pictures contrast unfavorably with those of such modern painters as Turner, of whom Mr. Ruskin has very truly said that "the conception of every individual inch of distance is absolutely clear and complete in the master's mind—a separate picture fully worked out: but yet, clearly and fully as the idea is formed, just so much of it is given, and no more, as nature would have allowed us to feel or see; just so much as would enable a spectator of experience and knowledge to understand almost every minute fragment of separate detail, but appears to the unpracticed and careless eye just what a distance of nature's own would appear—an unintelligible mass. Not one line out of the millions there is without meaning, yet there is not one which is not affected and disguised by the dazzle and indecision of distance. No form is made out, and yet no form is unknown." On the subject of breadth Mr. Ruskin has, moreover, the following very judicious remarks: "It were to be wished that our writers on art would not dwell so frequently on the necessity of breadth, without explaining what it means, and that we had more constant reference made to the principle, which I can only remember having seen once clearly explained and insisted on—that breadth is not vacancy. Generalization is unity, not destruction of parts; and composition is not annihilation, but arrangement of materials. The breadth which unites the truths of nature with her harmonies is meritorious and beautiful, but the breadth which annihilates those truths by the million is not painting nature, but painting over her; and so the masses which result from right concords and relations of details are sublime and impressive, but the masses which result from the eclipse of details are contemptible and painful."

BREAD-TREE. See CAFFER BREAD.

BREAKERS, in maritime language, are the waves that break violently over rocks lying a short distance under the surface of the sea. They cover that particular part of

the sea with a foam, and produce a hoarse and often terrible roaring. "Breakers ahead" is one of the most alarming announcements made by the lookout men of a ship, seeing that the B. denote the existence of sunken rocks which may, perchance, pierce the hull of the vessel.

BREAKING BULK, in the Scotch law, signifies making use of an article supplied in bulk, or in quantity; by which act one is said to break bulk, and is, in consequence, prevented from afterwards objecting to it, and returning it to the seller. See **SALE OF GOODS**.

BREAKING INCLOSURES is an expression to be found in Scotch law-books, and means the destruction or invasion of planting and inclosures by persons or their cattle. The punishment for this offense is provided for by several old Scotch statutes, the principal of which are two passed in 1661 and 1685 respectively. The penalties are pecuniary, with right to detain the cattle found trespassing, until such penalties, along with the damage and costs, are paid. See **PLANTATION**.

BREAKWATER is a barrier intended for the protection of shipping in harbors or anchorages. It sometimes happens that, in front of a semicircular bay, a small island is so situated as to form a natural breakwater. This is to some extent the case with the isle of Wight, which occupies such a position as to protect Portsmouth and Southampton from the south. In many other places, however, bays and harbors are without such screens. A pier may be so placed and constructed as to serve also the purpose of a B., but the term B. is generally confined to a structure used solely for protection, and not for berthage or traffic, and breakwaters are frequently insulated, so as to be cut off from any communication with the shore unless by water.

Plymouth B. is the best known of these engineering works. The sound or harbor, being open to the s., was so much exposed to storms that, early in the present century, it was determined to construct a B. across its mouth, with openings between it and the shore, on either side, for the ingress and egress of shipping. The works were commenced in 1812. The operations consisted in transporting along a tram-road large blocks of limestone got from a neighboring quarry, shipping them in vessels fitted with trapdoors, and by means of these depositing them in the shape of a huge mound in the required situation. As soon as the stones began to appear above water, a perceptible benefit resulted in the relative calmness of the sound during the prevalence of storms; but the structure was frequently very roughly handled by the waves, which altered and flattened its shape. A severe storm in Nov., 1824, threw a great portion of the stones over into the sound. It was not until 1841 that the works were finally completed, by the deposition of more than 3,000,000 tons of stone, and the expenditure of nearly £1,500,000. The B. is nearly a mile long, the central portion is 1000 yards; and two wings, of 350 yards each, extend from the ends of this at a slight angle. The open channels at each end, between the B. and the shore, are each about half a mile wide, and their depth is respectively 40 and 22 ft., at low water. The B. is 133 yards wide at the base, and 15 at the top—the two sides being made very sloping for the security of the stones. The slopes and top are faced with masonry. The water-space protected by this B. comprises 1120 acres, and it is generally admitted that the money has been well spent on the work.

Holyhead B. is formed of stone quarried in Holyhead mountain, drawn along a tramway on a timber structure, and cast into the sea. It more resembles a pier than the B. at Plymouth, for it is attached at one end to the shore, and is intended to convert Holyhead bay or roadstead into a harbor of refuge. The works consist of a mound of loose stones up to low water, and ashlar upright walls with a parapet above that line, with a railway on the top for trains.

Portland B. is of very great value, in converting into a harbor of refuge the expanse of water between the Dorsetshire coast and the isle, or rather peninsula of Portland. An act of parliament was obtained in 1847, authorizing the works. The B., starting from the n.e. point to the isle, stretches nearly due n. for more than 2 m., with one or two intervening openings for the ingress and egress of shipping. The works were conducted more easily than those of any other great B.; for the isle contains an abundance of stone easily quarried, and the steep shores afforded facility for transporting the stones by their own gravity to their destination. The work—which is an upright ashlar superstructure, with a parapet founded on a mound of rubble stones—was done chiefly by convict labor; the depth is about 50 ft. at low-water. From the nature of the operation, any part of the B. became useful as soon as constructed, increasing the safety of Portland bay as a harbor of refuge.

Dover B. progresses slowly, and has involved an enormous outlay. There is no stone near to form a mound, as in the other breakwaters spoken of, and, in consequence, the work requires to be brought up in solid ashlar from the bottom by the diving-bell, with the interior formed of blocks of concrete. It has never been clearly stated whether the government regards this B. as a protection to a great naval station and fortified harbor, or as a chief feature as a harbor of refuge for commercial fleets. In 1844, a commission of inquiry recommended that £2,500,000 should be laid out in forming a harbor of refuge at this place. In 30 years the work has not been finished, the great depth and frequent storms constituting terrible obstacles. The water is very deep—viz., 42 ft. at low-water; the

accumulations of shingle very troublesome; and several years must elapse before it can be made evident whether the Dover B. is worth the national money expended upon it.

Alderney B. is a great work, consisting of ashlar walls and parapet, built on a stone mound up to low-water from a depth of 73 feet. Small breakwaters have been constructed at Cotte near Marseilles, at the mouth of the Delaware in the United States, and at Buffalo in lake Erie; but they do not call for description.

Cherbourg B. is the greatest and the most costly ever constructed. Nearly 100 years ago, M. de Cessart proposed to the French government the formation of a B. at Cherbourg, to be commenced by the construction of a number of hollow cones formed of timber-framing, sunk in a line as close as they could be placed to each other, and then filled with stones. These cones, of which there were to be 64, each about 70 ft. high, 150 ft. in diameter at the base, and 60 ft. at the top, were intended to form a nucleus to the stone breakwater, to prevent the stones, during its formation, being knocked about and too much spread out by the action of the waves. In 1784 to 1788, 16 cones were constructed, and 13 of them sunk; but so great was the destruction which they underwent during stormy weather, that the government at length abandoned the plan, and carried on the stone breakwater without the aid of the cones. It was completed under Napoleon III. at a cost exceeding £2,500,000. The B. itself was finished in 1853, but since that year large fortifications have been built upon the upper works. The length is nearly 2½ m.; the B. is 300 ft. wide at the bottom, and 31 at the top. The chief mass consists of rubble or unshaped stones, thrown down from ships; but there is a larger ratio of wrought and finished masonry than in the Plymouth B., consisting of granite blocks imbedded in cement. The depth of water is about 60 ft. at low-water spring-tides; and the B. rises to 12 ft. above high-water level. The water-space included within and protected by the B., is about 2000 acres, but two thirds of this has scarcely depth enough for the largest-sized ships. The relation which this B. bears to the vast military and naval arrangements of the place will be noticed under CHERBOURG.

Many substitutes have been proposed for solid breakwaters, such as floating breakwaters constructed of timber framework, open iron screens, etc., but none of them have been shown to be suitable for actual practice. Close timber-work, filled in with stones, is found to be quite efficacious; but on most of our coasts the timber is liable to be eaten by the marine worm, which is an almost insuperable objection to its being used under water.

BREAKWATER (*ante*). In the United States the only important work of the kind is at Lewes, Del., at the entrance of Delaware bay. A breakwater was resolved upon in 1828, and the next year the site was fixed at cape Henlopen. In 1870, the engineer reported the completion of the harbor "according to the original project devised more than 40 years ago." In the year after the completion, more than 20,000 vessels visited the harbor, and since its first use in 1833, about 300,000 vessels of all sorts have sought shelter or trade behind the Delaware breakwater. A recent report says: "Let a threatening sky foretell the approaching storm, and a few hours will suffice to fill a previously vacant harbor. Let a north-easterly storm continue a day or two with severity, and the harbor becomes crowded entirely beyond its capacity." Its present capacity is determined by the space that is sheltered by the B. proper. This is a straight line nearly half a mile long, and may be taken as the diameter of a half circle behind it, the area of which will represent approximately the sheltered harbor. North-east of the B. is the ice-breaker structure, a quarter of a mile in length, with an opening of about the same extent, through which the sea rolls without hindrance. Within the past five or six years this important work has been much extended and improved. It is altogether of stone, in rubble-wall and more finished work. There are finished or in construction several B.'s in the northern lakes, for the most part made of timber cribs filled with stone.

BREAM, a name which is apt to occasion some confusion to beginners in ichthyology, being applied equally to certain fresh-water fishes of the family *cyprinidae* (q. v.), and to certain sea-fishes of the families *sparidae* (q. v.) and *chaetodontidae* (q. v.) or *squamipennes*, among which the resemblance is a mere general one of outward form, the first of these families belonging to the order of *malacopterous*, or soft-finned, the other two to that of *acanthopterous*, or spiny-finned fishes.

The breams of the family *cyprinidae* were included in the genus *cyprinus* (see CARP) by the older naturalists, but are readily distinguished from that genus as now defined, and from other allied genera, by their deep and compressed form, by the great convexity of both the dorsal and the abdominal outline, by the want of spiny rays in the dorsal and anal fins, by the great length of the base of the anal fin, and by the want of cirri or barbules at the mouth. They form the genus *Abramis* of Cuvier.—The COMMON B., or CARP B. (*A. brama*), is an inhabitant of many rivers and lakes of Europe, even as far n. as Norway and Sweden, and of some of those of Britain and Ireland. It thrives best in still waters, and in some of the Irish lakes attains a large size; it has been known to reach 12 or even 14 lbs. The tail is very broad and much forked, the head small and acuminate, the eyes very large, the scales small, the general color yellowish-brown, the cheeks and gill-covers silvery-white.—The WHITE B., or BREAMFLAT (*A. blicca*), differs from the common B. in its silvery color, the smaller number of rays in the pectoral and anal fins, and other particulars. It has never been taken of so large a size. It is

found in many parts of the continent of Europe, and in some of the British lakes and rivers.—The POMERANIAN B. (*A. buggenhagii*) differs much more widely from the common B.; the body is much thicker in proportion to its depth, the scales larger, the base of the anal fin shorter, the tail less forked. This fish is known to occur in a few places of England and Ireland, and is said to abound in Pomerania.

The acanthopterous breams, or SEA BREAMS, are mostly of the family *sparidae*, and nearly allied to the gilthead (q.v.), in connection with which they may most properly be noticed. The common sea B., indeed, often receives the name of gilthead. Only one of the British sea fishes called B., the *brama raii* already noticed (see BRAMA), belongs to the family *chætodontidae*.

Angling for Bream.—Of the two kinds of B. known to anglers, the carp B. is much the best for sport. The flesh of the B. is not held in much estimation, though the carp B. is infinitely to be preferred of the two. B. are found in both ponds and rivers. They prefer deep, still holes, or quiet, well-sheltered eddies in the bends of rivers. Here the angler will find them in large numbers. They are rather capricious in feeding; at times they will not bite for weeks together. Being a sly, shy-biting fish, the tackle required for them must be fine. They may be taken by means of the ledger (q.v.) in rivers, where they should be fished for in the same way as directed for barbel, save that it will be found advisable to use another hook, which should be fastened on to the line about 8 in. or a foot above the ledger lead, as B. often take their bait some inches off the bottom. The hooks should be No. 7. In float-fishing for B. in holes or eddies, a stout swan-quill float and half a dozen No. 1 shot below it, will be found sufficient for the purpose; and, having ground-baited as directed for barbel, put on two small red worms for the angling bait, or about an inch of the tail of a bright, well-scoured lob-worm. The former is preferable. Two hooks, one to rest on the bottom, and one 6 or 8 in. off it, will be found useful, for sometimes one will be taken, and sometimes the other. The fish being tender-mouthed, should be played gently. After the first rush, a B. soon tires, for his form is not fitted or shaped for a prolonged resistance. The B. has an unpleasant practice of bowing downwards and rubbing the line with his tail, and the line often comes up covered with a thick slime from his body, for a foot or more above the hook. It is needless to remark that this must be cleared off before the tackle is again used. The rod should be a light cane-rod, moderately stiff, and some 12 or 13 ft. long for float-fishing for B. from a boat or punt. Of all baits, worm is decidedly the best. Some recommend bullock's blood and grains to ground bait with, but worms are found to answer all purposes. B. spawn about the end of May, choosing the most weedy spots for that purpose; and after scouring and cleansing in some gentle gravelly stream for a week or two, they return to the deep still holes again. A clay or sandy bottom is preferred to any other. The presence of B. may always be detected by their fondness for coming at times to the top of the water, or, as anglers term it, "priming." Early in the morning, or late in the evening, the whereabouts of B. may always be discovered by their rising then. In Lough Erne the shoals are prodigious, and cause a ripple on the water like a stiff breeze of wind.

BREAMING, in nautical affairs, is a cleansing process which a ship undergoes after a voyage, or after lying for a long time in harbor. The ship's bottom, under such circumstances, often becomes covered with grass, ooze, shells, or sea-weed; and B. consists in the removal of these impurities. The ship is laid aground after the tide has ebbed, or is docked, or is careened (see CAREENING); furze and fagots are placed under it; fire is applied; the heat melts the pitch, etc., of the hull, and the pitch and filth can then be scraped and brushed off.

BREAST, THE FEMALE, or mammary gland, consists of a series of tubes, radiating from a common center, the nipple, which is situated in an areola or dark-colored patch. On the surface of the latter are several (from 4 to 10) sebaceous glands, which secrete an unctuous fluid to protect the skin of the nipple, which is very thin, from the saliva of the sucking infant. The milk-tubes (15 to 18 in number) enlarge into *sinuses*, and pass each to a separate lobe or subdivision of the breast, where they divide into twigs and branches (the *lactiferous ducts*), which end in minute vesicles. The lobes are held together by fibrous tissue, and are well packed in fat, which increases sometimes to an enormous extent the apparent size of the organ. It will be readily understood how over-distension of these delicate tubes, from whatever cause, must be productive of great suffering. When an abscess forms in the B., it is very dangerous to allow the matter to remain; but when an opening is made into an abscess of the B., the cut must be made in some line radiating from the nipple, so as to avoid division of the milk-tubes.

BREASTPLATE, in ancient armor, was a plate of iron, steel, or other metal, so fastened as to protect the chest or front of the wearer. The back-plate, in like manner, was worn to protect him from attack from behind. In modern European armies, almost the only representative of the B. is the front half of the *cuirass*, worn by the *cuirassiers* in certain foreign states, and by the household cavalry (life-guards and horse-guards) in England.

BREAST-SUMMER, BRESSUMER (Fr. *sommier*, a lintel), a beam supporting the whole front of a building, in the same way in which a lintel supports the portion over an

opening. They are seen in England and on the continent in old houses that are built partly of wood and partly of stone, brick, or mud.

BREAST WHEEL. See **WATER POWER**, *ante*.

BREASTWORK, in fortification, is a hastily constructed earthwork; not so high as to need a *banquette* (q. v.) for the defenders to stand upon, but sufficient to afford shelter when they are standing on the level of the ground, and firing over the crest. The dry ditch or trench from which the earth has been taken to form the B., affords an additional defense. A B. is midway between a *parapet* and an *épaulement*, in size and importance.

BREATH, OFFENSIVE, may depend upon some cause limited to the mouth or nose, or it may arise from diseased conditions of the respiratory or digestive apparatus. If, from want of proper attention, the teeth have collected a quantity of putrescent particles around them, they must be well scrubbed with a brush and tepid water, with some powdered carbonate of magnesias mixed with it. A wash composed of a teaspoonful of tincture of myrrh in a pint of water is also very useful. Occasionally the secretion from the tonsils (q. v.) is very offensive; and then a solution of nitrate of silver, 4 grains to 1 ounce of water, should be applied to them every morning, with a camel-hair brush, and small alterative doses of medicine administered. Solutions of soda in water are also very useful. Should the fetid smell arise from a portion of dead bone, the latter must be removed whenever it becomes loose. Inhalations of steam from hot water into which some creasote has been dropped, is much recommended for cases in which the cause resides in the nose and respiratory passages. When, however, it is caused by digestive derangements, the treatment should consist in purging, to empty the intestinal canal, followed by soda, to correct acidity, and tonics, of which the bitter infusions and tinctures, and the dilute mineral acids, are among the best.

All medical treatment is unavailing to correct the foul odor which rises from the stomach of the habitual drunkard, or from the victim of gangrene or abscess in the lungs.

BREATH AND BREATHING. See **RESPIRATION**.

BREATH FIGURES. See **COHESION FIGURES**, *ante*.

BREATHITT, a co. in E. Kentucky; 600 sq. m.; pop. '70, 5652—181 colored; in '80, 7738. The co. is hilly, with forests, and has iron and coal; but the main productions are agricultural. Co. seat, Jackson.

BREBEUF, JEAN DE, b. France, 1593; killed in the Huron country in 1649; a Jesuit missionary who came with Champlain in 1626. His labors were mainly among the Hurons, with whose life and language he became very familiar. When the town of St. Louis was taken by the Iroquois, B. and Lalemont, his associate, were made prisoners and tortured to death. It is said that B.'s head is preserved in the pediment of a silver bust in the convent of the hospital nuns in Quebec. Some of his writings on the Huron language are preserved, and were translated by Albert Gallatin.

BRECCIA, a term adopted from the Italian to designate a mass composed of angular fragments of rocks of the same or more different kinds, cemented together by an enveloping paste, or by infiltrated iron or carbonate of lime.

BRECHE-DE-ROLAND, a defile of the Pyrenees, between France and Spain, about 11 m. s. of St. Jean de Luz, with an elevation of about 9500 ft. above the sea. It is a difficult passage of from 200 to 300 ft. in width, between precipitous rocks rising to a height of from 300 to 600 feet.

BRECHIN, a t. of Forfarshire, on the left bank of the South Esk, 8 m. w. of its junction with the sea at Montrose. Pop. '71, 7959. It unites with Montrose, Arbroath, Forfar, and Bervie in returning one member to parliament. Spinning, bleaching, distilling, and brewing are carried on here, as also the manufacture of linens and sailcloth. B. was once a walled town, and contained an abbey of Cuffees, instituted, it would seem, about the end of the 10th century. David I. founded a cathedral and bishopric here in the 12th century. Part of the cathedral, built chiefly in the 13th, 14th, and 15th centuries, is now the parish church. Close to the church is a round tower, similar to the Irish ones and to the one at Abernethy, the only other example in Scotland. The tower is 85 ft. high, 25 ft. in diameter at the base, and 12½ ft. at the top, and it is surmounted by a 15th c. spire of 25 feet. B. castle, the ancient seat of the Maules (now of their representative, the earl of Dalhousie), was taken by Edward I. in 1303, after a siege of 20 days. B. was burned by Montrose in 1645; and near it, Huntly, on the part of James II., defeated the Crawfords in 1452. Gillies, the historian of Greece; Maitland, the topographer; and Dr. Guthrie, the famous Scotch preacher, were natives of Brechin.

BRECKENRIDGE, a co. in n.w. Kentucky, on the Ohio river; 450 sq. m.; pop. '70, 13,440—1682 colored; undulating surface, well watered and fertile. There are some curious sink-holes and caves in the co.; and there are various medicinal springs. Chief productions, agricultural. Co. seat, Hardinsburg.

BRECKENRIDGE, a village in Wilkin co., Minn., on the Red River of the north; the terminus of the St. Paul and Pacific railroad. 217 m. w.n.w. of St. Paul. Steamers pass down the river to Manitoba.

BRECKENRIDGE, JOHN, D.D., 1797-1841; b. Ky.; a Presbyterian minister, graduate of Princeton college. In 1822 he was licensed to preach, and soon afterwards served as chaplain in congress. His first church was in Lexington, Ky., where he established a newspaper, *The Western Luminary*. In 1831 he removed to Philadelphia and was secretary and general agent of the Presbyterian board of education; subsequently professor in Princeton theological seminary; and in 1838 secretary and general agent of the board of foreign missions. He resigned in 1840, and just before his death was chosen president of Oglethorpe university, in Georgia.

BRECKENRIDGE, JOHN CABELL, b. Ky., 1821; studied law in Transylvanian university, and settled at Lexington. He was a member of congress from his state for several terms; and in 1856 was elected vice-president. In 1860 he was nominated for president by the extreme southern section of the Democratic national convention, but, with Douglas and Bell, was defeated by Lincoln. He was immediately chosen U. S. senator, but abandoned his seat and went with the secessionists, where he entered the army and became a maj.gen. In 1865, just before the collapse of the rebellion, he was appointed confederate secretary of war. At the close of the conflict he went to Europe, where he remained several years.

BRECKENRIDGE, ROBERT JEFFERSON, D.D., brother of Rev. John, 1800-71; b. Ky.; at first a lawyer and member of the legislature; but in 1829 he joined the Presbyterian church, and in 1832 became pastor of the first Presbyterian church in Baltimore, where he officiated for 13 years. In 1845, he became president of Jefferson college; two years later removed to Kentucky and became state superintendent of public instruction. In 1853, he was professor of theology in Danville seminary. Dr. B. was a strong old-school leader in the great division of the Presbyterian church. In the slavery discussions he was extreme on neither side, and when the civil war began he was for the union, but he was much opposed to the emancipation proclamation. In 1864, he was president of the convention that nominated Lincoln for a second term. Dr. B. is credited with being the principal author of the common school system of Kentucky. Among his works are *Internal Evidences of Christianity*; *Papism in the United States*; and some books of travel.

BRECKNOCKSHIRE, or BRE'CON, an inland co. of South Wales, to the s. of Radnor, from which it is separated by the Wye. Length, about 35 m.; average breadth, 20. Area, 719 sq.m., of which two thirds are cultivated. B. is one of the most mountainous counties in South Wales, and has deep, beautiful, and fertile valleys. Two principal mountain-chains, the highest in South Wales, rising with Brecknock peaks to a height of 2862 ft., intersect the county in the n. and s., and occupy, with their offshoots, a great part of the surface. Old red sandstone occupies the s. and middle of the co., and silurian rocks the north. The chief rivers are the Wye, Usk, Yrfon, Elan, Claerwen, and Tawe. The climate is severe and rainy but healthy among the mountains, and in the valleys comparatively mild. The agriculture, though still defective, especially in the higher districts, was greatly improved by the Brecknockshire agricultural society, instituted in 1755. The chief crops are oats and barley, but much wheat is also grown in Talgarth and Crickhowell, the most fertile districts of the county. In the valleys in the e. some hops are raised, and some orchards are seen. The native small black-cattle are reared in the hills, while in the lowlands the Hereford breed predominates. The mineral produce is small, consisting of iron, especially along the s. border; coal and limestone are also found in the south and west. The Brecon canal connects the co. with the Bristol channel, and many railways have been constructed throughout the county. There are several small factories of woolens and worsted hosiery; also several important iron-works, but the ore is chiefly obtained from adjoining counties. B. returns one member to parliament. Pop. in 1871, 59,901. The chief towns are Brecon, the co. and only corporate one, Builth, Crickhowell, Hay, and Llanely. There are many remains of British and Roman camps, Roman roads, cairns, cromlechs, mounds, and castles throughout the county. B. formed part of the territory of the Silures, who bravely withstood the Romans. The Normans, under Bernard Newmarch, wrested the co. from the Welsh princes in 1092. Llewelyn, the last British prince of Wales, was killed in this co. in 1282, and by his fall the native mountain-chiefs were entirely subdued. Half the people in B. still speak Welsh.

BRECON, BRECKNOCK, or ABERHONDDU, the capital of Brecknockshire, South Wales, is situated in an open valley in the middle of the co., at the confluence of the Usk, Honddu, and Tarell, 171 m. w.n.w of London. It lies in the midst of fine mountain scenery, and has beautiful public walks. South of B. lie the three mountain-peaks, the Brecon beacons. Pop. '71, 5845. It returns one member to parliament. Flannels, coarse woolens, and hats are manufactured. Barnard Newmarch, a relative of William the conqueror, founded the town, and built a castle here in 1094. He also founded two priories here in the reign of Henry I. Henry VIII. turned one of the priories into a college, still existing; the other is now the parish church. B. was formerly surrounded by a wall, having ten towers and five gates. Hugh Price, founder of Jesus college, Oxford, and Mrs. Siddons, the celebrated actress, were natives of Brecon.

BREDA, a t. of North Brabant, Holland, situated at the confluence of the navigable rivers Merk and Aa, and containing (Dec. 31, 1874) 15,335 inhabitants. It formerly pos-

sessed the means of laying the surrounding country under water in the event of an attack, but the importance of the town, as a military position, has passed away, and in 1876 the fortifications were removed. It has a Gothic cathedral, with a lofty tower and several interesting monuments; also an old castle built in 1350, which was for some time the residence of Charles II. of England, and is now a military academy. There are manufactures of carpets, linen, hats, soap, leather, etc., and dye-works, breweries, and rope-walks. It is celebrated as the place where, in 1566, the protest of the Dutch nobles, known as the "compromise of Breda," against the measures of Philip II. of Spain in the Netherlands, was presented and rejected. During the subsequent centuries, it was the scene of much conflict and diplomatizing until 1813, when the French were finally driven out. B. is now a station of the railway net.

BREDA, JAN VAN, 1683-1750; a Dutch painter. He imitated Wouvermans and Breughel so cleverly that connoisseurs are often unable to detect the copy. B. was a long time employed in England.

BREDERODE, HENDRIK VAN, Count, 1531-68; one of the sovereign counts of Holland, and a leader against Spanish domination in that country. He was for many years turbulent, active, and a source of annoyance about as much to his own party as to the other. After the complete success of the Spaniards he asked Egmont to intercede for him with the regent; his followers were dispersed, some were put to death, and he himself died in a few months from intemperance and anxiety.

BREDOW, GABRIEL GOTTFRIED, 1773-1814; a German historian and professor in the university of Breslau. English readers know his *Manual of Ancient History; Researches on History, Geography, and Chronology*, and *Historical Fables*.

BREE, MATTHEUS IGNAZIUS VAN, an excellent Flemish painter, b. at Antwerp 22d Feb., 1773, and educated partly there, and partly under Vincent in Paris. As early as 1798, he attracted attention by his "Death of Cato," and several other excellent pictures soon followed. A peculiar talent for rapid and vivid sketching enabled B. to execute for Napoleon, in a few hours, "The Maneuvering of the Fleet before Antwerp on the Scheldt," and, with equal celerity, Napoleon's "Entrance into Amsterdam, at the Moment when the Magistrate presents him with the Keys of the City." In 1816, he painted the famous Leyden burgomaster, Van der Werff, in the act of addressing the famished and murmuring populace during the siege of 1576: "Take my body, and share it among you." This great work—now in the town-house of Leyden—is marked by a felicitous arrangement of the figures, and by a bold and lively coloring, after the style of Rubens. Other celebrated pictures of B.'s are: "Count Egmont receiving Spiritual Consolation before his Execution," "Rubens dictating his Dying Testament," "The Tomb of Nero at Rome, with a Group of Lazzaroni and Musicians." B. died 15th Dec., 1839. In the latter part of his life, he was director of the academy of fine arts at Antwerp.

BREË, PHILIPP JACOB VAN, brother of the preceding, b. 1786, also acquired some reputation as a historical painter.

BREECH, of a gun, is the end farthest removed from the muzzle. It always contains a great mass of metal, to enable it to withstand the shock occasioned by the explosion of the gunpowder. For details, see **CANNON, HOWITZER,** etc.

BREECHES BIBLE. See **BIBLE.**

BREECHING, of a naval gun or carronade, is a strong rope by which the recoil of the gun is checked at such a point that the muzzle is brought wholly within the port-hole, where the seamen can sponge and reload it.

BREECH-LOADING, in artillery, relates to a mode of constructing large pieces of ordnance, and small-arms or hand-firearms, the peculiar manner of charging which the term describes. This subject is now occupying much attention, and the patented inventions relating to it are very numerous. The Armstrong gun (see **ARMSTRONG**), among others, is a breech-loader; and so is the Whitworth gun. A considerable amount of additional mechanism is necessary for this purpose; seeing that the breech must be so far opened as to admit of the introduction of a ball or shell, and a cartridge, and then so firmly closed as to resist the immense pressure occasioned by the explosion. The objects sought to be attained by this change from the old system are many—quickness in loading, ease in cleaning after firing, accurate adjustment of the diameter of the ball to the calibre of the gun, facility in making the ball accommodate itself to the spiral rifle-grooves of the piece, etc.; but it is still a contested question, especially between the rival inventors of breech-loaders and muzzle-loaders, to what extent these objects are attained. In relation to muskets and fowling-pieces, Mr. Greener, of Birmingham, who has written much on the subject, disputes the usefulness of B.; he denies that it is more safe, more accurate, or more forcible than muzzle-loading; while certain advantages which it may possess are, he thinks, counterbalanced by the greater cost of the weapon. The relative merits of breech and muzzle loading fowling-pieces were tested in 1859-60 by various trials, under the management of the editor of *The Field*, and resulted in favor of the breech-loaders. The demand for the latter has, in consequence, enormously increased.—This subject receives further notice in various parts of the *Encyclopædia*, in relation to certain kinds of ordnance and small-arms expressly constructed on the B. principle. See **BREECH-LOADING**.

BREECH-LOADING ARMS AND NEEDLE-GUNS. To be loaded at the breech, and to be fired by the penetration of a needle into, or the impinging of a piston on, a detonating cap within the cartridge, are distinct attributes in a weapon; and although it is only within the last forty years that the system has been carried out with success, breech-loading arms have been tried, accepted, and abandoned without number during the last three centuries. Indeed, a sort of instinct dictates that loading at the breech is the preferable course; and all the earliest muskets were so made, the system being doubtless abandoned from the difficulty of accurately closing the breech, in those days of rough workman-ship. The extraordinary efficacy of breech-loading arms for military purposes was brought prominently forward during the wars of the last few years, and notably in the Prussian campaigns of 1864 against Denmark, and of 1866 against Austria. The successes of the Prussian arms were attributed in no small degree to the rapidity with which their troops could fire as compared with the enemy. They had, in greater or less numbers, borne these same rifles since 1835, but these were the first opportunities of using them in warfare. To all the other powers, whose men still carried muzzle-loading rifles, and who had debated, without practical result, for years past the question of armament with breech-loaders, soldiers thus armed appeared irresistible. From July, 1866, to the present moment, the hammer and the anvil have been busy night and day throughout the civilized world in making the weapons of death yet more deadly. Scarcely two countries seem to have adopted the same plan: each nation has elaborated a system from among its own inventors. Those possessing no great reserve of rifles have prepared new arms; but the majority of governments have been content, in the first instance, to convert their existing stock into breech-loaders of as good a construction as circumstances would permit. Thus, Britain, after offering a handsome prize for the best design, selected one said (subject to some controversy) to be the invention of the late Mr. Snider. As this weapon has been produced already to the number of a million, and as it has confirmed the favorable auguries entertained of it by accuracy of fire, and by loading thrice to the muzzle-loader's once, much of the following article will be devoted to a consideration of it. At the same time, it is to be borne in mind that the British government only regarded the Snider arm as a makeshift for the conversion of the enormous stock of Enfield rifles then in hand, reserving to itself the ultimate selection of a pattern on which to manufacture new weapons. It is not to be understood from what is said above that Britain adopted a breech-loading arm in a sort of panic *after* the battle of Sadowa. It was after the Danish campaign, on the 11th July, 1864, that it was decided as an abstract question to arm the British infantry with breech-loaders; a portion of the cavalry having for a number of years previously been armed with Sharp and Westley Richards carbines, loading at the breech. The selection of an arm took longer: but by the beginning of 1865 it had been decided to convert our great stock of rifles on the "Snider" system. In 1869 it was determined that new arms should be on the Martini-Henry system—i.e., with the Henry barrel, and the Martini-breech action. A description of this rifle will be given farther on.

Breech-loading.—The advantage of breech-loading is obvious: to be able to insert the charge at the breech end instead of the muzzle, is to save time, and to avoid exposure to hostile fire during the operation of loading and ramming home, which involves considerable outstretching of the limbs. The great condition of success is, that the bullet shall be propelled with equal force and accuracy, and with equal safety to the rifleman, as from the muzzle-loader.

When a charge is ignited, the constituents of the gunpowder, assuming a gaseous condition under the heat engendered, expand into a volume of light gas many times greater in bulk than the powder before occupied. On the amount of this expansion, and its sudden action on the projectile, the force of the shot depends. Any joint in the breech-piece through which a portion of this gas can escape, without having imparted its thrust to the ball, tends, therefore, to lessen the range and penetration; while the shock of the explosion falling more severely on this than on any other part of the barrel, tends yet more to dislocate the breech-piece, and diminish the closeness of the joint's fit. In weapons which do not call for a long range, as revolver pistols, a perceptible interval is left between the chamber and barrel, through which much gas escapes; but in rifles, which have range and penetration as principal objects, there is *primâ facie* ground for preferring a muzzle-loader. The gas, however, is far from pure as generated in the barrel, for much water is produced and held in suspension, while there is also a solid residuum consisting of unburned materials of the powder. In the muzzle-loader, these clog (or, technically, foul) the barrel, filling the grooves, and rendering the ramming home of succeeding charges more and more difficult. The effect is, that a solid mass of unburned matter is gradually forced by ramming into the head of the barrel, destroying the accuracy and usefulness of the weapon. In the breech-loader, this solid deposit must be provided against both ways. The backward throw on firing (for, of course, the charge explodes with equal power in every direction) tends to force it into the mechanism of the joints, preventing their proper fit, and continually augmenting the escape of gas; and on the other hand, the deposit in front is most detrimental to accuracy of fire. This protection of the breech-apparatus, the prevention of fouling, and the retaining and if possible improving the force and accuracy of fire, were the problems which inventors have had to solve.

A moderate escape of gas in front of the first position of the ball, is not found to be any material disadvantage. If, then, the barrel could have an opening where the cartridge could be inserted, and then pushed backwards, an escape of gas through the joints by which the opening might be subsequently closed would be comparatively immaterial; but this formation would be impracticable, because the explosion of each cartridge would drive the fouling more and more backwards, till ultimately the chamber at the breech would be unable to contain the cartridge. It is clear, therefore, that the charge must be inserted either at the barrel's head, or, if the barrel be opened, in a space close to the barrel's head. In either of these cases, the breech must be solidly closed to resist the explosion. A third case, as in the Snider, is where the cartridge is inserted and then pushed forward, the aperture being closed by a solid breech-piece which completely fills that portion of the barrel, and forms, with the barrel's head, a massive foot to resist the backward pressure of the fired powder. No breech action can be made to fit so accurately as to prevent a backward escape of gas unless a properly-constructed cartridge-case is used. A perpendicular moving joint is found, in practice, to be the best adapted for preventing a serious escape of gas. In the Prussian needle-gun, the end of the barrel is the frustum of a cone, which fits into a corresponding cavity in the fore-end of the breech-piece, but in practice this joint is not sufficiently tight to prevent an escape of gas from the self-consuming cartridge used with this gun, which becomes inconveniently great after long use of the weapon, and it is only available when the breech-piece is pushed up from the rear. In the Snider and several other breech-loading weapons, the cartridge is made itself to close hermetically the aperture between the barrel and the fore-end of the breech-piece. This is effected by the expansion of the cartridge-case, which, being composed of metal, or a combination of metal and paper, is driven out by the force of the explosion till it completely fills the chamber and prevents any escape backwards between the sides of the case and the chamber. The cartridge has a portion of its case at the base flattened out into a rim which fits into a corresponding recess in the end of the barrel; and to prevent expansion backwards, which would fracture the cartridge-case, and injure the breech or the firer, the breech-piece is made to fit as closely as possible against this base. This rim is on the Snider cartridge.

The remainder of the article will be devoted to a description of the three most prominent breech-loaders—(1) the Prussian Zündnadelgewehr; (2) the British Snider; and (3) the Martini-Henry.

The Prussian gun, although it may be said to be now obsolete (having been superseded by the Mauser, a bolt gun on much the same principle, but using a metallic cartridge-case), was first in the field. As regards its breech-apparatus and needle-lock, it consists of three concentric hollow cylinders, with a solid cylindrical bolt inside the last. The rear-end of the barrel is firmly screwed into the head of the chamber, which is fixed to the stock of the piece, and is open at the rear-end. The upper half of the cylinder is cut away at the front-end for rather more than the length of the cartridge: this constitutes the opening in which the musketeer inserts the cartridge. From the rear of this opening to the back, a groove is cut, sufficiently wide to allow the square pillar of the breech-handle to pass along it. In the middle of this groove is a right-angled shunt, offering a stop to the breech-handle when drawn backwards, unless it be likewise turned downwards, when it may be passed completely out at the rear-end. Next within the chamber is the breech-piece, which, to admit the cartridge, is drawn back for a sufficient distance by the breech-handle along the groove. When the cartridge is deposited in the recess in the chamber, this breech-piece is closed against the heel of the barrel by moving up the handle to the front-end of the groove, and then turning it down to prevent it from being driven back on the explosion of the charge; representing, indeed, the resistance offered by the heel of an ordinary muzzle-loading barrel. Firmly screwed within the breech-piece, at a short distance from its front, is a solid block of metal, on which impinges the first force of the explosion. Projecting from this block to the base of the cartridge is a strong *tige*, or pillar, around which a space containing air is left. Through this pillar is the channel for the needle to work. Fitting within the rear-end of the breech-piece is a smaller cylinder, constituting the lock of the gun. It slides within the breech-piece, and is retained from falling out backwards by the spring, which catches in a notch. Along the bottom of this cylinder is a groove to admit the passage of the trigger; and at the back is a short upright handle, by means of which the weapon is cocked. Lastly, within the lock is a bolt, pressed forward by a spiral spring, and having the needle rigidly fastened to its front end. Having now described the several parts of the rifle, it is easy to follow it from the moment of a shot being fired until the next is ready for discharge. The soldier first presses down the spring with his finger, releasing the catch below it, and enabling him to draw back the lock to the next catch on the spring. Having done so, he raises the breech-handle to the perpendicular, and passes it along the groove to open the breech. This done, he places the cartridge in the opening thus made in the chamber, and again moving up the breech-piece to close the breech, the *tige* in it pushes the cartridge forward into the barrel, and the rifle is at once at "half-cock;" for in drawing back the lock, the front point of the spring forced the bolt (including the needle) with it, and the projection on it, having passed over the head of the trigger, is caught by the latter in a way which can only be released by the falling of the trigger. It will be observed that at

half-cock the needle is ready to penetrate the cartridge, but that the spiral spring is loose and without power. The position is now obtained, in which the bolt projects at the back, and the spiral spring is compressed into a state of passive strength. All that is now needed to fire the gun is to press upon the trigger, when the bolt, being released by the depression of the spiral spring, asserts its power, and drives the needle into the heart of the cartridge, the parts all resuming their original positions. At first sight, one cannot help exclaiming: "What a complicated apparatus with the four cylinders and the springs!" but, in reality, it is as simple as almost any other gun, for the whole mechanism of the lock (q. v.) is dispensed with. If it be desired to take the needle-gun to pieces, press the trigger till the point bears. If the breech-handle be then in the hinder part of its groove, the breech-piece with its contents will slip out of the chamber. Pressing down, next, the spring until the second catch is passed, there is nothing to retain the lock in the breech-piece; and the lock being free, the needle, with its attached bolt and spring, falls readily out of its fore-end. The gun is thus taken to pieces in a few seconds, and as many suffice to put it again in fighting order. The most delicate portions are the needle and the spiral spring; but in case of accident to these, there is a spare one in a small cavity opening by a spring in the butt-end of the stock. The worst feature about this celebrated gun is its weight, 12 lbs., or 33 per cent heavier than the Enfield or Snider rifle.

The converted Enfield or "Snider" rifle was selected in 1865-66 by the British government from the specimens submitted at an open competition of inventors. It is an extremely simple weapon, and though by no means free from faults, has given very satisfactory results up to this time. The ordinary Enfield barrel is shortened by about $2\frac{1}{2}$ in., and the heel of the remainder is screwed in to a strong shoe, with which is connected by a powerful hinge, the solid breech-piece, which, when shut, completely closes the breech. Through this passes the piston or striker; the normal position of the piston is maintained by a spiral spring within the nipple. Given the breech open, the cartridge is inserted and pushed forward into the barrel, where its metal rim fills the groove left around the barrel's heel. The breech-piece is closed down, the hammer drawn to full-cock, and the piece is ready for discharge. The breech-piece is securely locked by the spring bolt, which enters a recess in the false breech, and can only be withdrawn on the lever thumb-piece being pressed by the thumb in the act of again lifting the breech-block. On the trigger being pulled, the hammer falls, drives in the piston, and out against the detonating cap of the cartridge, with a sharp blow, firing the charge. The hammer is drawn back to half-cock, the piston flies up to its former position; the breech-piece is thrown back, and slid on its hinge along the pin until occurs a process during which a small catch hooks back into the breech, by its projecting rim, the empty cartridge-case. The canting of the rifle to one side now throws this out, a spring within the hinge moves the breech-piece to its former place, and the gun is ready for another charge.

The cost of altering an "Enfield" to a "Snider" varies from 15s. to 20s. During the transition period, upwards of a million were converted in this way, besides a large number of new arms made for our own government; but conversion and manufacture are now suspended both in the government factories and by the large small-arms companies. The government factories were capable of converting 1100 rifles daily.

At first, the firing of the Snider was inferior to the old Enfield; but, by alterations in the bullet, effected by col. Boxer, in the direction of decreasing the specific gravity at the apex by the insertion of a wooden plug (which is now, however, dispensed with, and the point of the bullet spun over the mouth of the cavity), this condition has been reversed, and the Snider now fires 30 per cent better than the old Enfield. Of course, these changes add to the cost of the cartridge, which has, however, these great perfections—first, that it is absolutely impervious to wet; and second, that fire can scarcely be communicated to it otherwise than through the detonating cap. A single cartridge has been fired within a barrel of loose cartridges without exploding any of the others.

Adverting to the Snider cartridge, the whole is inclosed in a roll of thin brass foil, outside which is a covering of paper, and having for its base an iron disk, in front of which is a double cup of thin brass, while a round of millboard or pulp encircles the chamber containing the percussion-cap, which communicates with the powder. Between the powder and the ball is a layer of wool. The ball has, as explained above, the point spun over a cavity in its front, and a conical hollow is made at the base; into the wider part of this is dropped the wooden plug, while on the circumference of the bullet, and outside this conical hole, are four small cannelures or cuts in the lead. When the powder explodes, the wooden plug is driven forwards to the head of the hollow, driving the base of the bullet outwards till the lead completely fills the grooves of the rifle—a process aided by the comparatively less resistance at the cannelures. These cannelures are also receptacles for a wax lubrication which prevents fouling, interposing always a film of wax between the bullet and the barrel. The charge and bullet are held together by the copper sheathing being pressed into the cannelures. Returning to the percussion-cap, we would find, if it were enlarged, an apparatus where the cap is a thin copper cylinder open at front and closed at the rear end, where there is contained a deposit of detonating powder, of great sensitiveness. A brass bead, called the "anvil," is contained within the cap, the sharp point being next the detonating powder, and its broader

end resting at the bottom of the cap-chamber on each side of the hole. The cap itself fits tightly into the chamber, leaving no opening for the escape of gas backwards from the explosion, and is fired by the external blow of the piston or striker, which drives the base of the cap down upon the point of the anvil, by which means the detonating powder is exploded, and the flash, passing down the sides of the anvil, communicates through the opening with the powder in the cartridge. The weight of the bullet is 480 grains; of the powder, 70 grains; the cost being about £3 per thousand.

From this description, it is evident that the Snider cartridge is a complicated arrangement; but it is not much more so than that of the Zündnadelgewehr, though vastly more efficient.

In comparing the Snider and the Prussian gun, the former has certainly the greater simplicity; while its smaller weight (9 lbs. to 10½ lbs.) is an immeasurable advantage. Of the two it is probably the less likely to get out of order, but would perhaps be the most difficult to restore if it did. There is this difference of a material character between the two weapons, that in the Prussian arm, the needle, by its own mechanism, fires the charge; while in the Snider, it is a mere medium for conveying the blow of the hammer.

The principle of the action consists in closing the breech by a falling block, working in a mortised breech body, and hinged on a pin at the back end, and falling in front sufficiently when open to clear the opening of the barrel; the top of the breech-block forms an inclined groove, along which the cartridge is slipped into the barrel. The ordinary gun lock is replaced by a direct acting striker, impelled by a spiral spring, both being contained within the breech-block. The act of opening the lever draws down the breech-block, simultaneously drawing back the striker, and compressing the spiral spring; at the same time the toe of the cranked extractor is struck by the breech-block, thus throwing its upper claws, which encircle the base of the cartridge-case, backward, and jerking out the used case. On a fresh cartridge being inserted, the lever is drawn back and fixed to the stock by the spring. This closes the breech, but the spiral spring is kept compressed, and the striker at the full-cock position, by the tumbler, into the bent of which the point of the trigger and the tumbler-rest entered when the breech was opened. The trigger being pulled, the tumbler is let loose, and the spiral spring discharges the pointed end of the striker on to the cap in the rear-end of the cartridge, which is thus fired.

The following table shows the breech-loading rifles in use in 1879 by the principal powers:

Country.	System adopted.	Bore.	Weight of rifle.	Weight of bullet.	Weight of powder.
		Inch.	Lbs.	Grains.	Grains.
Austria	Werndl432	9.88	313	62
Belgium	Albini-Braendlin433	10.14	386	77
Denmark	Remington450	9.08	386	60
England and Turkey	Snider577	9.05	480	70
	Martini-Henry450	8.75	480	85
France	Converted Chassepôt433	8.93	386	85
Germany	Mauser433	10.75	378	71
Holland	Beaumont433	9.59	336	66
Italy	Vetterli412	6.61	316	54
Russia	Berdan420	8.48	370	78
Sweden	Remington480	9.55	370	66
United States	Springfield450	9.13

The breech-loaders with and without the needle arrangement are too numerous even for mention. In addition to what are known as breech-loaders proper, there are repeating-arms, one of the most remarkable of which is the Spencer magazine rifle, having, in a tube in the stock, a series of cartridges, which, by a simple action, pass into the barrel for discharge. As the gun can ordinarily be loaded at the breech without drawing on the magazine, it is doubtless that this reserve would be a powerful means of defense in a moment of danger, as in resisting cavalry; but among its drawbacks are weakening of the stock, serious increase of weight, and, worst of all, great complexity and delicacy—fatal objections in the rough usage of active service. Nearly all sportsmen now use breech-loading guns.

BREECH-LOADING GUNS (*ante*). The introduction of these arms in the United States, dates properly from 1865, from which date muzzle-loading arms were no longer manufactured at the Springfield armory. A short time before the late rebellion, the government tested a number of breech-loading guns, such as the Burnside, Cosmopolitan, Gallagher, Joslyn, Merrill, Maynard, Smith, Lindner, and Sharp. None of these are now used except the Sharp gun, which has been adapted to the metallic cartridge. During the war the Spencer rifle was much used by the U. S. cavalry; it has a magazine in the butt of the stock, holding 7 cartridges that are admitted one at a time by the movement of the trigger-guard used as a lever. The shell of an exploded cartridge is expelled by the same movement. It may be used also as a single breech-loader, but the magazine must first be shut off. The Henry gun (not to be mistaken for the Martini-Henry gun) has the magazine under the barrel. By movements of the lever, 17 metallic

cases or cartridges can be brought into the chamber in succession. This gun, like the Spencer, can be used as a single breech-loader by shutting off the magazine. It has been changed, however, by O. F. Winchester, and is now termed the Winchester gun. Among other magazine guns may be mentioned the Ball, Fogarty, and Gardner guns. The well-known Remington gun is a single breech-loader, and has an iron receiver that is screwed to the breech of the barrel, in which the breech-block and lock are to be found. It uses metallic-cased cartridges, and has been adopted by the governments of Egypt, Spain, and several other countries. The Remington gun is used in the U. S. navy.

In 1866, the secretary of war called a board of officers, gen. Hancock acting as president, to report the form and caliber which should be adopted for breech-loading muskets and carbines, and the method of converting muskets from muzzle-loading to breech-loading arms. After an examination of 22 different breech-loading muskets and 17 different breech-loading carbines, the board reported the best caliber for muskets to be 0.45 of an inch, the best charge of powder from 65 to 70 grains, and the best weight of ball from 480 to 500 grains. In 1869, a board of officers, presided over by gen. Schofield, was called to meet at St. Louis to select the six best patterns of muskets for infantry and carbines for cavalry. After examining a great number of different breech-loaders, they reported that the only guns suitable for military service were those of the Remington, Springfield, and Sharp systems. These guns were tried accordingly until 1872, when, in compliance with an act of congress, a board of officers, gen. A. H. Terry as president, was appointed to meet in New York and Springfield, "to recommend a breech-loading system for muskets and carbines to be adopted for the military service, which system, when so adopted, shall be the only one to be used by the ordnance department in the manufacture of muskets and carbines for the military service." After testing over 100 breech-loading guns, the board recommended (May, 1873) that the Springfield breech-loading system be adopted for military service, and this report being approved, that system is now used by the government for the U. S. army and militia. This breech-loader has a receiver screwed to the breech of the barrel. The shell of the exploded cartridge is ejected by a combined cam and spring through a motion of the hinge in the opening of the breech-block. The firing-pin goes through the breech-block in an inclined direction from the nose of the hammer at the side to the center of the rear of the chamber, where it strikes the head of the cartridge, exploding the fulminate when its rear end is struck by the hammer.

BREED, in domestic animals, a variety or often merely a race distinguished by the possession of particular qualities, but not differing from the ordinary type of the species so as to constitute what naturalists usually designate a variety. The peculiarities of breeds in animals find an exact counterpart in cultivated plants, the value of particular kinds often depending, in a great measure, upon characters scarcely capable of being defined in the language of scientific description, but to the production and perpetuation of which the attention of the cultivator cannot be too earnestly directed. These, also, in plants, as in animals, have of themselves little permanence, and the preservation or perpetuation of them depends upon the same assiduous attention and high cultivation from which, more frequently than from any mere accidental circumstances, they have originated. Thus it happens that the most improved varieties of garden-plants usually degenerate even under ordinary horticultural treatment, and the choice pansies of the florist lose their characteristic excellences if a place is simply assigned to them in a common flower-border. The improvements which cultivation has effected in the productions of the fruit, flower, and kitchen garden do not, however, possess an economic importance to be compared to that of the similar improvements in the cereals and other plants cultivated on the most extensive scale, or in the breeds of some of the most valuable domestic animals. To the breeding of these, great attention has of late been paid—probably more since the beginning of the 19th c. than in all the previous history of the world—and with results the magnitude of which may in some measure be estimated from the statement made on very competent authority, that within the last thirty years the weight of mutton produced has been about doubled in proportion to the number of sheep kept. To the improvement of the B. of horses, attention has been paid for a much longer time than to that of oxen and sheep; and to this must, in a great measure, be ascribed the different excellences of some of the well-known breeds employed for very different purposes. The use of the horse in war, and for purposes of pomp and luxury, appears to have been the reason of the higher degree of attention thus paid to it, even from ancient times. The Arabs have long been particularly careful of the B. of their horses, and diligently preserve a record of their pedigree. What is called *blood* in horses, however, only fits them in a higher degree for certain purposes; and with regard to this as to other animals, the judgment of the breeder must be exercised, as the perpetuation, increase, or combination of particular qualities may be the object which he has in view. Fleetness and strength are important qualities in horses, the extremes of which never co-exist in the same animal, but of which a certain combination is for some purposes very desirable; and either of these may be displayed in a great degree without much *bottom*, or power of enduring continued severe exertion—a quality of very high value. The properties most desired in sheep and oxen are very different from those most highly esteemed

in the horse—the fleece and the flesh being chiefly regarded in sheep, the flesh and the milk in oxen. Sometimes a perpetuation of good qualities is the great object of the breeder, and a combination of them in the highest possible degree is aimed at; sometimes, the production of the largest possible quantity of beef or mutton in the shortest time being almost exclusively designed, the breeder neglects considerations which would be of importance if his stock could not be improved by animals obtained from other quarters. Extraordinary differences are certainly found to exist among animals of the same species in the readiness with which they convert food into flesh and fat, and in the age at which they are fit for the hands of the butcher. One effect of the attention bestowed of late upon the breeding of stock, has been to supply the market, to a great extent, with the flesh of younger animals than could previously be sent to it—a change evidently tending not only to the benefit of the farmer, but to the increase of the national wealth; because that land, even without increased produce of grass, sends a greater amount of beef and mutton to market within the same term of years. Those sheep and oxen which exhibit in the highest degree the qualities just referred to, are also characterized by shortness of legs, smallness of bones, smallness of head, and fineness of skin; qualities the very opposite of those which would fit the animal for a wild state and an independent existence.

Some of the most important breeds of domestic animals will be mentioned under their proper heads. It remains for us only to allude here to the rules and physiological principles of breeding; but the latter, in so far as application of them has yet been found practicable, are only the best known principles of physiology (q. v.). In a great measure, however, the rules which guide the breeding of stock have been learned by experience, and are rather to be regarded as contributions to science than as deductions from it. The probable relative influence of the male and female parent upon their progeny, is a point unquestionably of the greatest importance, but concerning which widely different opinions have been maintained; and another much controverted and important point is, the propriety of *breeding in and in*. Practically, the rule is always observed, by those who seek the improvement of a *breed*, of selecting the very finest animals possible, both male and female; although a great improvement of the existing stock on a farm is often effected in the most advantageous manner by the mere introduction of males of better quality. The dangers of breeding *in and in* are very generally acknowledged, even whilst it is contended that they may very much be obviated by careful rejection of every faulty animal, and that in this way the utmost advantage may be taken of the very highest improvements; but it is likewise very generally admitted that, if equally improved individuals can be obtained not so nearly related, it is better to seek the perpetuation of the B. by their means. It is a rule also of much practical importance, that an improvement of B. is to be attained not by a *cross* between animals of very different breeds, as between a dray-horse and a race-horse, but only between those which are comparatively similar. The result of the intermixture of very dissimilar breeds is never in any respect satisfactory.

BREEDÉ, a river in Cape Colony, flowing chiefly through the district of Zwelendani, which contains cape Agulhas, the most southerly point of Africa. It rises in the Warm-Bokkeveld, a mountain-basin about lat. 33° 10' s., and long. 19° 30' e., running first to the w., and afterwards to the s.e.; and it enters St. Sebastian's bay or Port Beaufort, from which, upwards, it is navigable to a distance of 40 miles. Its exports are wool, skins, feathers, grain, butter, cattle, mules, etc.

BREEZE. See WIND.

BREESE, SAMUEL L., 1794–1870; b. New York. He entered the U. S. navy, serving in the war with England and Mexico, but was retired before the war of the rebellion broke out, his rank being rear-admiral.

BREGENZ, a frontier t. of Austria, capital of the district of Vorarlberg, is situated at the mouth of the small river Bregenz, which here flows into the lake of Constance, between the Swiss and Bavarian territories, about 80 m. w.n.w. of Innsprück. From the ruins of the castle of Hohenbregenz, on a hill near the town, a very beautiful prospect is obtained of the lake and its surrounding vineyards, etc. B. is one of the oldest towns, and was formerly one of the chief fortified places in the southern part of Germany. The inhabitants (1869), 3686 in number, are engaged in agriculture, horticulture, and cattle-keeping. Cotton-spinning and weaving are also carried on; and articles of wood, gold, and iron are manufactured. Its position secures B. a large transit-trade in the produce of the district. In the neighborhood lies the mountain-pass, the *Bregenzer-Klause*, formerly a strong military position between Swabia and the Tyrol. During the thirty years' war, the Swedes, in 1646, stormed and captured the fortress of B., and destroyed the works in the pass.

BRE'HON LAWS (in Irish, *dligidh breitheamhuin*—that is, “judges' laws”), the name usually given to the system of jurisprudence which prevailed among the native Irish from an early period till towards the middle of the 17th century. The *breitheamhuin* (pronounced *brei-hoo-in*, or *brehon*), from whom the laws had their name, were hereditary judges, who administered justice among the members of their tribe, seated in the open air, upon a few sods, on a hill or rising ground. The poet Spenser, in his

View of the State of Ireland, written in 1596, describes the B. L. as "a rule of right unwritten, but delivered by tradition from one to another, in which oftentimes there appeareth great share of equity, in determining the right between party and party, but in many things repugning quite both to God's law and man's: as, for example, in the case of murder, the brehon—that is, their judge—will compound between the murderer and the friends of the party murdered, which prosecute the action, that the malefactor shall give unto them, or to the child or wife of him that is slain, a recompense, which they call an *eric*; by which vile law of theirs many murders amongst them are made up and smothered: and this judge being, as he is called, the lord's brehon, adjudgeth for the most part a better share unto his lord, that is, the lord of the soil, or head of the sept, and also, unto himself for his judgment, a greater portion than unto the plaintiffs or parties grieved." Spenser was ignorant that pecuniary compensation for manslaughter had obtained in the ancient laws, as well of England as of most European nations. He was mistaken, too, in believing that the B. L. was an unwritten code. Many manuscript collections of the B. L. still exist in public and private libraries in Ireland, England, and Belgium. These manuscripts are regarded as varying in date from the early part of the 14th to the close of the 16th century. For the laws themselves, a much higher antiquity is claimed. On this point, we must be content to quote what has been said on the part of the very few persons who have had an opportunity of making themselves acquainted with the existing collections of the brehon laws. "So far as we have external evidence to guide us," say Dr. J. H. Todd and Dr. C. Graves, two eminent Irish antiquaries, "there is no reason to suspect that the brehon laws have undergone any material change since the time of Cormac Mac Cuilleain, king and bishop of Cashel, who died 908 A.D. He was a man of great learning and energy, who certainly promoted the execution of considerable literary works, and under whose influence it is not improbable that a systematic compilation of the laws may have been effected. Of this, however, we have no distinct record. On the other hand, we find scattered through all parts of the laws allusions to a general revision of them made in the 5th c., at the instance of St. Patrick, who, in conjunction with certain kings and learned men, is said to have expunged from them all those institutions which savored of paganism, and to have framed the code called the *Seanchus Mor*. These same documents assert the existence of still more ancient written laws, the greater part of which are ascribed to Cormac Mac Art, monarch of Ireland, in the middle of the 3d century. However slow we may be to acquiesce in statements of this kind, which contradict what we have learned concerning the progress of legislation in the remaining parts of western Europe, we may readily admit that the subject matter of many of the laws demonstrates their great antiquity, as it indicates the primitive nature of the society in which they prevailed. In spite of the attempts to efface it, traces of heathenism are still discernible in many parts of them. They enumerate various ordeals of a pagan character, which are expressly termed *magical*, and specify the occasions on which a resort to them was prescribed. There are also provisions in the laws of marriage which prove that Christianity could have exercised but a feeble influence at the time when they were enacted. The language in which the brehon laws are written is a convincing proof of their antiquity. They are not composed in a peculiar dialect, as many writers have maintained; but if their style differs from that of the vernacular Irish of the present day, as Anglo-Saxon does from modern English, this dissimilarity is to be ascribed mainly to the effects of time, by which the orthography and grammatical forms of the language have been modified, and legal terms and phrases of constant recurrence have become obsolete." The world of letters will be able, in no long time, to judge for itself on the opinions thus expressed. It is now upwards of twenty years since the publication of the B. L., at the charge of the Irish government, was strongly urged by such men as Guizot, Grimm, and Rank abroad, and Hallam, Macaulay, and earl Stanhope at home. A commission was accordingly appointed by the earl of Eglinton in 1852, "to direct, superintend, and carry into effect the transcription and translation of the ancient laws of Ireland, and the preparation of the same for publication." The commissioners intrusted the transcription and translation of the B. L. to the two most eminent of Irish scholars—the late Dr. John O'Donovan, professor of Celtic in the queen's college at Belfast; and the late Eugene O'Curry, professor of Irish archæology in the Roman Catholic university of Ireland. These gentlemen having finished their task the editorship of the work was intrusted to Mr. W. J. Hancock, late professor of political economy in Trinity college, Dublin, and the Rev. Thaddeus O'Mahony, professor of Irish in the university of Dublin. The publication, it is reckoned, will extend to eight volumes, of about 550 pages each. Three of these have already appeared—the last in 1873—under the title of *Ancient Laws and Institutes of Ireland*. Along with the Irish text, an English translation is given, accompanied with preliminary dissertations, glossaries, and indexes, and they give a vivid and characteristic picture of the polity and social life of a Celtic people. A fac-simile reprint of the B. L. has recently been published in 17 volumes by the B. L. commission.

BREISACH, ALT, a very old t. of the grand duchy of Baden, situated on an isolated basalt hill on the right side of the Rhine, about 12 m. w. of Freiburg. As early as the time of Julius Cæsar, *Mons Breisiacus* was known as a strong military position, and was

taken by Ariovistus when he invaded Gaul. Being regarded as the key to the w. of Germany, it was a prominent scene of action during the thirty years' war, at the conclusion of which it was ceded to the French. During the next century, it frequently changed masters, now belonging to France, and now to Austria. The French destroyed its fortifications in 1744, and during the war of the revolution in 1793, part of the town was burned by them. In 1806, the French handed it over to the house of Baden. The minister of St. Stephen is a venerable structure in good preservation, and contains several old monuments. Pop. '71, 3255.

BREISACH, NEU, a t. in Alsace, opposite to Old B., 2 m. w. of the Rhine, on the Rhine and Rhone canal; pop. '66, 1981. It was fortified by Vauban by order of Louis XIV.

BREISLAK, SCIPIONE, 1748-1826; an Italian geologist. He was professor in a Roman college, and devoted his leisure to geological researches in the papal states. The king of Naples appointed him professor of mineralogy to the royal artillery, and under his direction the sulphur refining works in the district of Solfatara were erected. In 1798, he published his *Physical Topography of the Campagna*, and followed with various works on similar topics.

BREITENFELD, a village and manor of Saxony, about 5 m. n. of Leipsic. It is historically remarkable for three battles, fought on a plain in its neighborhood. The first of these, between the Swedes and the Imperialists, which was fought on the 7th Sept., 1631, was of the highest importance to Europe, as it secured the permanency of Protestantism and the freedom of Germany. Tilly's pride had reached its highest point after the fall of Magdeburg, which took place on the 10th of May, 1631; and in the early part of Sept. of the same year, he advanced against the Saxons, with an army of about 40,000 men, for the purpose of forcing the elector, John George I. (who would not submit to the edict of restitution, and was treating with the Swedish king, Gustavus Adolphus), into an alliance with the emperor. No other way remained than for the elector to join the Swedish king, who had just entered Pomerania. Gustavus Adolphus, joined by the Saxons, advanced towards Leipsic, where Tilly lay, who advanced into the plain of Breitenfeld. The imperial forces were completely defeated, and their three most distinguished generals, Tilly, Pappenheim, and Fürstenberg, wounded. The second battle which B. witnessed again resulted in the triumph of Swedish valor: it took place on the 23d of Oct., 1642, between the Swedes, headed by Torstenson, one of the pupils of Gustavus, who had invested Leipsic, and the archduke Leopold, with gen. Piccolomini, who were advancing from Dresden to its relief. The Swedes gained a complete victory over the imperialists, who fled into Bohemia, leaving behind them 46 cannon, 121 flags, 69 standards, and the whole of their baggage. The third battle of which B. was the scene, was fought on the 16th of Oct., 1813, and was part of the great contest known as the battle of Leipsic.

BREITMANN, HANS. See **LELAND, CHARLES GODFREY**.

BREMEN, one of the three free cities of Germany, is situated on the Weser, about 50 m. from its mouth. Pop. '75, 102,177, nearly all Protestants. B. is divided into the old and the new town—the former on the right, the latter on the left side of the river, which is spanned by four bridges. The ramparts and bastions round the old town have been leveled, and formed into public promenades, which are laid out with excellent taste. Among the principal buildings, the cathedral (built about 1160), the Gothic town-hall (begun about 1405), with its famous wine-cellar, said to contain hock of the vintage of 1624, the exchange, the museum, the post-office, and the observatory of Dr. Olbers, from which he discovered the planets Pallas and Vesta, are remarkable. The position of B. makes it the emporium of Brunswick, Hesse, and other countries through which the Weser flows. Besides its excellent water communication, it is connected by railways with the whole of western and central Germany. B. is an exceedingly thriving place, its trade having more than doubled within the last ten years. Large vessels stop at Bremerhaven, where there is a spacious harbor constructed, about 38 m. below B., with which it is connected by electric telegraph. Vessels not drawing more than 7 ft. of water can come up to the town itself. B. carries on an extensive commerce with the United States of America, the West Indies, Africa, the East Indies, China, and Australia. Its great foreign trade, however, is with the United States, from which alone, in 1870, it imported produce of the estimated value of 30,000,000 dollars, exporting in return goods to the value of 17,500,000 dollars. With the exception of Hamburg, no continental port ships so many emigrants to the United States as B., through its main port at Bremerhaven. The total number of vessels arriving at B. in 1874 was 3407, and the number departing, 3243. The number of ships belonging to the port in 1875 was 226, with an aggregate burden of 176,115 tons. In 1873, the value of the imports amounted to £26,270,500, exports to £20,381,900, a very great increase as compared with the year 1858, when the imports were valued at £8,237,000, and the exports at about £8,000,000. The chief imports are tobacco, coffee, sugar, cotton, rice, skins, dyewoods, wines, timber, hemp, etc. The exports consists of woolen goods, linens, glass, rags, wool, hemp, hides, oil-cake, wooden toys, etc. Large quantities of tobacco are re-exported. B. has manufactures of woollens and cottons, cigars, paper, and starch,

and extensive ship-building yards, breweries, distilleries, and sugar-refineries. The cigar and sugar manufactures have of late declined, the former on account of the increase of duty. In 1872, it is said that 2500 hands were engaged in making cigars. It has steam communication with New York, and Hull, Havana, the n. coast of South America, etc.

B. first became of historical note in the 8th c., when it was erected into a bishopric by Charlemagne. It soon attained considerable commercial importance, and became one of the principal cities of the Hanseatic league (q. v.). Having frequently suffered at the hands of the French, it was, in 1810, incorporated with that empire; but it recovered its independence in 1813, and by the congress of Vienna was admitted, in 1815, as one of the Hanse towns, into the Germanic confederation. In 1867, it became a member of the North German confederation, and now it forms part of the German empire. The area of its territory is about 100 sq. m.; pop., including the town of B. (1875), 141,848. The government is intrusted to a senate of 18 members, two of whom are chosen burgo-masters, and to a municipal council of 150 burgesses.

BREMERHAVEN, a port on the Weser, near 10 m. from its mouth, was founded by Bremen in 1827, on ground acquired from Hanover, and soon became a thriving place. It has extensive docks and quays, and may be regarded as the seaport of Bremen. Pop. in 1875, 12,501.

BREMER, a co. in n. e. Iowa, on Cedar river; 430 sq. m.; pop. '70, 12,528; '80, 14,078; good soil, well watered and timbered. Communication is had by the Cedar Falls and Minnesota railroad. Agricultural productions. Co. seat, Waverly.

BREMER, FREDRIKA, the well-known Swedish novelist, was b. near Abo, in Finland, 17th Aug., 1801; but when she was only three years old, her father removed to Sweden. As a child of eight, she had already begun to write verses; and the works of German poets, Schiller more especially, exercised a most powerful influence over her youthful imagination. Her original novels first made their appearance under the general title *Tekningar ur Hvardagslifvet*, at Stockholm, in 1835. It was not, however, till 1842 that the English public hailed with delight the appearance, in an English dress, of *The Neighbors*, perhaps the most universally popular of all Fredrika B.'s charming pictures of domestic life in Sweden. Encouraged by its enthusiastic reception, Mrs. Howitt subsequently published translations of *The Diary*, *The II. Family*, *The President's Daughters*, *Brothers and Sisters*, *Life in Delectaria*, and *The Midnight Sun*. In 1849, Miss B. visited the United States, and there spent two years, passing some time in England on her return. In her *Homes of the New World*, published simultaneously in England, America, and Sweden, in 1853, she not only presents us with exquisite descriptions of scenery, and vivid pictures of social life, but with sound and comprehensive views on political and moral subjects. Returning to her home in Sweden, to find a beloved sister dead, Miss B. devoted her talents and energies to the carrying out of certain philanthropic objects, in which she had throughout life felt deep interest, more especially the education of the poorest classes. As a writer of fiction, she is distinguished for feminine delicacy, shrewd sense, humor, deep knowledge of human nature, and a graphic and forcible style. Her works have been translated into almost all the languages of Europe. She died in 1865. Her life and unpublished writings were issued by her sister in 1868.

BRENDAN, or BRANDANUS, the legendary hero of great ocean voyages made under the protection of angels; revered in Ireland as a saint, where, and in England, he is supposed to have founded religious establishments. His death is set down in 578 A. D.

BRENHAM, the seat of justice of Washington co., Tex., on a branch of the Houston and Texas Central railroad, 72 m. w. n. w. of Houston; pop. '70, 2221; in '80, 4101. It is in a cotton-raising region. There are eight churches, the Live Oak female seminary, an opera house, and a number of manufactories.

BRENNER PASS, a pass in the main chain of the Alps, on the road between Innsbruck (q. v.) on the n. and Botzen (q. v.) on the s., connecting the s. of Germany with Venice and the n. e. of Italy. The B. P. is the lowest which crosses the main chain of the Alps, the summit being only 4775 feet above the level of the sea. Lofty mountains rise above it to the further height of more than 7500 ft., yet the scenery of the pass is less sublime and interesting than that of any other of the great passes of the Alps. It is open at all seasons of the year. At the summit of the pass is the village of Brenner, a resting-place for travelers, with a pop. of about 400. The climate here is so severe that corn seldom ripens. Here the traveler finds in close contiguity the Eisach, a small stream, which, after growing to be a considerable river, joins the Adige and the Sill, a tributary of the Inn; the one stream flowing to the gulf of Venice, and the other into the Black sea. On 18th Aug., 1867, a railway through the B. P. was opened, and thus a complete line of railway communication was established between Germany and Italy; Botzen having already been connected by a railway through the valley of the Adige with Verona, and so with the whole of Italy—Innsbruck being likewise connected with the railway system of Germany. This work was begun by the Austrian government when Venetia belonged to the Austrian empire, and with the view not only of facilitating military operations, but of restoring the commercial prosperity of Venice, by making it the port of southern

Germany. The prosecution of the works, however, was not arrested by the great political changes which took place. A liberal commercial treaty, recently made between Austria and Italy, binds the two countries together in community of interests restoring in fact, the natural state of things with which political animosities had long interfered: and it has been made quite apparent, from the activity with which the roads have been repaired on some of the Alpine passes, and particularly that of the Stelvio, that both Germans and Italians appreciate the importance of an intimate commercial intercourse. The distance from Innsbruck to Botzen in a direct line is only 52 m., but by the windings of the road or of the railway, it is much increased.

BRENNUS, the name or rather the title of several Gallic princes, is probably a Latinized form of the Kymric word *brenhin*, which signifies a king. The most famous B. was that leader of the Gauls who, in 390 B.C., crossed the Apennines, and hurrying through the country of the Sabines, at the head of 70,000 men, encountered and overthrew on the banks of the Allia (q.v.) the Roman army. Had the barbarians immediately followed up their advantage, Rome might have been obliterated from the earth; but instead of doing so they abandoned themselves to drunken delights on the battlefield, and gave the Romans time to fortify the capitol, whither were removed all the treasures and holy things of the city. When B. entered the gates he found that all the inhabitants of the city had fled, with the exception of the women and children, and old men, the last of whom, with pathetic heroism, had resolved not to survive the destruction of their homes, and so, the chief among them, clothed in their robes of sacerdotal or consular dignity, and sitting in the curule chairs, waited the approach of their enemies, and received their death in majestic silence. B., having plundered the city, now besieged the capitol for six months. During the beleaguement occurred the famous night-attack, which would have been successful had not the cackling of the geese, kept in Juno's temple, awakened the garrison. At length, however, the Romans were compelled to enter into negotiations with the besiegers. They offered 1000 lbs. of gold for their ransom, which was agreed to. According to Polybius, B. and his Gauls returned home in safety with their booty; but the rather mythical Roman traditions affirm that, just as the Gauls were leaving the city, Camillus, who had been recalled from banishment and appointed dictator, appeared at the head of an army, attacked them, and, in two bloody battles, slew the whole of the barbarians to a man.

Another B., who occupies a conspicuous place in history, was that Gallic chief who invaded Greece, 279 B.C., at the head of 150,000 foot and 61,000 horse. After desolating Macedonia, B. forced his way through Thessaly to Thermopylæ. The Grecian army fled at his approach. B. now rushed on with a division of his great host to Delphi, which he had resolved to plunder; but the Delphians having taken up a very advantageous position on some rocks, resisted his further progress. Assisted by the terrors of an earthquake and a terrible storm, besides, according to reverential tradition, by the supernatural help of Apollo, they utterly routed the Gauls, who fled in dismay. B. was taken prisoner, and drank himself to death in despair.

BRENTA (*Medoacus Major*), a river of n. Italy, rises from two small lakes in the Tyrol; flows first in a southern, then in an eastern course through the Venetian territory; passes the towns Cismona and Bassano; receives an arm of the Bacchiglione below Padua, where it becomes navigable; and falls into the gulf of Venice, at the haven of Brondolo. The ancient bed of the B. was, some centuries ago, altered by the Venetians, who feared that their lagoons might be choked with sand by its floods. Afterwards, the old bed of the river was made use of as a canal, the *Naviglio di Brenta Magra*, which forms the chief communication by water between Venice and Padua, while the B. is but little used for navigation.

BRENTA'NO, CLEMENS, known as a novelist and dramatic poet, and as the brother of Goethe's "Bettina," was born at Frankfurt-on-the-Maine, 1777. He studied at Jena, and afterwards resided successively at Frankfurt, Heidelberg, Vienna, and Berlin. In 1818, through a morbid discontent with himself and his fellow-men, he retired to the cloister at Dülmen, in Münster. Latterly he resided at Regensburg, Munich, and Frankfurt-on-the-Maine, where he led the life of a recluse, and gained a considerable reputation on account of his sarcastic wit. He died at Aschaffenburg, on the 28th of June, 1842. In his earliest poems the peculiarities of the "romantic school" of his time are carried to excess. His dramatic productions, such as *The Merry Musicians*, a *Musical Drama* (Frankfurt, 1803), in which there are some gems of lyric poetry; *Ponce de Leon* (Göttingen, 1804), etc., are characterized by great dramatic power, amusing though rather far-fetched wit, and a wonderful flow of humor. Perhaps his most successful piece as a drama, is *The Founding of Prague* (Pesth, 1816). B. was most successful in his smaller novels, particularly in the *History of Caspar the Brave and the Fair Annerl* (2d edit. Berlin, 1831), which German critics call a "*chef-d'œuvre* in miniature." His last work, the legend of *Gokel, Hinkel, and Gakeleia* (Frankfurt, 1838), was intended as a satire upon the times in which he lived. He has received the grateful acknowledgment of his countrymen for his renovation of the good old history of George Wickram, of Kolmar, which he published under the title of *The Thread of Gold* (*Der Goldfaden*, Heidelb., 1809).

BRENT FORD, the co. t. of Middlesex, on both sides of the Brent, at its confluence with the Thames, 7 m. w.s.w. of London, and where the Thames is crossed by a bridge

leading to Kew. It consists chiefly of one long irregular street. Pop. '71, 11,091. It has large gin-distilleries, a soap-work, and the works of the West London water company. There are many market-gardens in the vicinity. Here Ironside defeated the Danes in 1016, after expelling them from London; in 1558, six martyrs were burned at the stake; and in 1642, the royalists, under Rupert, defeated the parliamentarians under col. Hollis.

BRENT GOOSE, or **BRENT BARNACLE**. This bird has been already noticed under **BARNACLE** (q.v.). We add here a few sentences from col. Hawker's *Instructions to Young Sportsmen*, which we borrow from Yarrell's *British Birds*. They refer to wild-fowl shooting on the coasts of Dorsetshire and Hampshire. "Towards Nov. or Dec., we have the Brent geese, which are always wild, unless in very hard weather. In calm weather, these geese have the cunning, in general, to leave the mud as soon as the tide flows high enough to bear an enemy; and then they go off to sea, and feed on the drifting weeds. To kill Brent geese by day, get out of sight in a small punt, at low water, and keep as near as possible to the edge of the sea. You will then hear them coming like a pack of hounds in full cry, and they will repeatedly pass within fair shot, provided you are well concealed, and the weather is windy to make them fly low. Before you fire at them, spring suddenly up, and these awkward birds will be in such a fright as to hover together and present a mark like a barn-door."—The extensive muddy and sandy flats between Holy island and the coast of Northumberland are a great winter resort of this species. It is also particularly abundant on muddy and sandy flats in Cromarty bay. The markets, both of London and Edinburgh, are well supplied with it during winter. The B. G. is known in some parts of England as the black goose; it is considered the most delicate for table of all its tribe, and is perhaps as much sought after as any. The B. G. differs in its habits from the common gray lag and several other species, inasmuch as it never feeds on fresh-water herbage, its tastes being exclusively salinous. B. G. may be distinguished, when on the wing, by their black bodies and white tails. Folkhard, in his excellent work, *The Wild Fowler*, gives much interesting information regarding this bird.

BRENTON, **EDWARD PELHAM**, 1774–1839; a capt. in the British navy. He wrote a *Naval History of Great Britain, from 1783 to 1822*. He was the founder of the Children's Friend Society.

BRENTON, **WILLIAM**, d. Newport, R. I. 1674; an emigrant from England, who held important offices in the colonies of Massachusetts and Rhode Island, being governor of the latter, 1666–69.

BRENZ, **JOHANN**, 1499–1570; a German reformer under Luther; a writer of great ability and popularity. One of his teachings was that the body of the Lord is everywhere present; hence his followers were called "Ubiquitarians."

BRESCIA, or **BRESCIANO**, a province in Lombardy, Italy, separated from Verona by Lago di Garda; 1784 sq.m.; pop. '71, 456,023. The n. part is occupied by a chain of the Rhaetian Alps; the remainder, about two thirds of the province, is a part of the great and fertile plain of Lombardy. The rivers are the Oglio, the Mella, and the Chiese, tributaries of the Po. Corn, flax, hemp, grapes, and olives are cultivated. The mountains yield iron, copper, marble, alabaster, and granite. There are manufactures of silk, wool, cotton, linen, iron, steel, copper, glass, and paper. The chief towns are Rovato, Chiara, Orzinovato, Monte-Chiaro, Salo, and Pontevedo.

BRESCIA, a city of Italy, capital of the province of the same name, in Lombardy, about 60 m. e.n.e. of Milan. It is romantically situated on the rivers Mella and Garza, in a wide fertile plain, at the base of several hills. The railway from Milan to Venice passes through Brescia. The city is for the most part regularly built, and, besides two cathedrals, the old and the new, it has numerous ancient churches, adorned with pictures and frescos, including many by masters of the Venetian school. Several interesting antiquities have been discovered. It has a valuable public library, the *Biblioteca Quiriniana*, founded and nobly endowed about 1750, by cardinal Quirini, a munificent encourager of literature. It contains upwards of 30,000 volumes, with many rare manuscripts. The pop. in 1872 was 38,906. B. has manufactures of woollen, silk, leather, paper, etc., and its wine is of good quality. The old name of B. was *Britia*, and its inhabitants were allied with the Romans when Hannibal crossed the Alps. It was captured by the Huns during their migrations, and afterwards passed through the hands of the Longobards, Charlemagne, the Franks, and the Germans. It was taken by the French under Gaston de Foix, in 1512, when it is stated that more than 40,000 of the inhabitants were massacred. The city never fully recovered from the effects of that inhuman sack and pillage. In Mar., 1849, B. as the only important town opposed to Austrian rule in Lombardy, was besieged by Haynau, and forced to capitulate.

BRESLAU, the capital of the province of Silesia, Prussia, is situated at the confluence of the Ohrlau and Oder. Next to Berlin, it is the most populous city in Prussia; its pop. was 207,997 in 1871; and in 1875, 239,050, more than the half of whom are Protestants. The Oder divides it into two parts, which are connected by numerous handsome bridges. The fortifications have been converted into beautiful promenades, and the ditch has been transformed into an ornamental sheet of water. The streets of the new portion of

B. are spacious and regular, and the houses stately and handsome, affording a pleasant contrast to the somber, massive structures of the old town. Educational institutions are numerous, including a university founded by the emperor Leopold I. in 1702, and now accommodating from 900 to 1000 students. The library contains 300,000 volumes. B. has many churches, the most remarkable being the Protestant church dedicated to St. Elizabeth, with a steeple 364 ft. in height (the highest in Prussia), and a splendid organ. The position of B., in the center of the manufacturing districts of the province, secures it a large trade, which its railway connection with all the important cities on every side, in addition to the facilities of communication which the Oder affords, enables it to turn to the best account. It has manufactures of linen, woolens, cotton, silks, lace, jewelry, machines, earthenware, soap, alum, starch, etc., and upwards of 100 distilleries; and a trade in corn, coal, metals, timber, hemp, and flax. B. is a city of Slavonic origin, and was for many centuries occupied alternately by the Poles and the Bohemians. It afterwards passed to Austria, from which it was taken by Frederick II. of Prussia, in 1741. Six years afterwards, it was captured by the Austrians, after a bloody battle, but retaken by Frederick in about a month. From that time until 1814, when its fortifications were completely demolished, it was frequently besieged.

BRESSA'NI, FRANCESCO GIUSEPPE, 1612-72; a Jesuit missionary among the Indians of Canada. In 1644, he was sent to the Huron country, but was captured and tortured by the Iroquois. After great suffering he was sent to the Dutch settlements at Albany, where he was ransomed for a large sum. He returned to France, but came back to missionary work and labored many years among the Hurons.

BRESSAY, one of the Shetland isles, e. of the Mainland, and separated from Lerwick by Bressay sound. It is 6 m. long and 2 broad, and is composed of Devonian rocks. It supplied Lerwick with peat, until the proprietor, fearing that the peat might be exhausted, stopped exportation; and it continues to supply the Shetland isles with slates. Pop. '71, 878, chiefly fishermen. Bressay sound is one of the finest natural harbors in the world, and is a rendezvous for herring-boats, and for all whalers and other vessels proceeding north. East of B., and separated from it by a narrow and dangerous sound, is a rocky isle, called Noss, 6 m. in circuit, girt on all sides by perpendicular cliffs, and rising abruptly from the sea to the height of nearly 600 ft., with a flattish top. A detached rock, or holm, on the s.e. side of the Noss, used to be communicated with by means of a cradle or wooden chair run on strong ropes, stretched across a yawning gulf, and admitting a man with a sheep to be drawn over at a time.

BREST, a strongly fortified city, in the department of Finistère, France, and one of the chief naval stations of the empire, is situated in lat. 48° 24' n., and long. 4° 29' w., on the n. side of the bay or road of Brest, which forms one of the finest harbors in the world. The only entrance to the bay is by a narrow channel called *Le Goulet*, which is scarcely a mile wide, and is strongly defended by batteries; the difficulty and danger of access to hostile ships being increased by certain rocks in the center of the channel. A new floating dock, quays, and pier were completed in 1876, at a cost of 22,500,000 francs. The small river Penfel flows through the town, which is, on the whole, irregularly built on an uneven site, and has steep, narrow, dark, and very dirty streets. In some parts communication between the lower and upper parts of the town can be effected only by stairs. The new quarter, the parade, and the quays, are more cleanly. B. has extensive ship-building yards, rope-walks, store-houses, etc.; its industry, indeed, is confined entirely to the equipment of the navy in its various branches. It has telegraphic communication with America by a submarine cable. The Bagnes (q.v.) or hulks no longer exists, the prisoners having been removed to the penal colony of Cayenne. Pop. '76, exclusive of garrison, 66,828. B. is a very ancient place, but it was not of much importance until the 17th century. Its splendid position made it an object of contention to French, English, and Spaniards. In 1631, Cardinal Richelieu resolved to make it a naval station, and commenced the fortifications, which were completed by Vauban, but have since been greatly extended. In 1694, the English under lord Berkeley were repulsed here with great loss. In 1794, the French fleet, under admiral Villaret-Joyeuse, was defeated off B. by the English fleet under admiral Howe.

BREST-LITOVSK, a t. in the government of Grodno, Russia, 131 m. s. of Grodno, in 52° 5' n. and 23° 27' e., at the junction of the Mukhovetz and the Bug. It is the seat of an Armenian bishop, who has authority over the Armenians in all the country. It has a varied and extensive trade, by means of the two rivers and the royal canal, in grain, flax, hemp, birch-tar, leather, etc. Pop. '67, 22,493.

BRETAGNE, or BRIT'TANY (*Britannia Minor*), a peninsula in the n.w. of France, formerly a province, and now divided into the departments of Finistère, Côtes-du-Nord, Morbihan, Loire-Inférieure, and Ille-et-Vilaine, is surrounded by the sea on the n.w. and s.w. Though the height of the mountains is nowhere considerable, their structure gives to the peninsula a wild and savage aspect. Clay-slate forms the center of the country, and masses of granite rise in the n. and the south. The climate is often foggy, and subject to violent storms of wind. Large tracts of land lie uncultivated; but in the well-watered valleys, vegetation is luxuriant. In ancient times, B., under the name of

Armorica, was the central seat of the confederated Armorican tribes, who were of Celtic and Kymric origin. Traces of them still remain in the old Kymric dialect of the three most westerly departments, and in the numerous so-called Druidical monuments. The name *Armorica* was changed for that of B., in consequence of the numerous immigrations from Great Britain in the 5th and 6th centuries. The peculiar, shut-in situation, and the characteristics of soil and climate in B., seem to have had a powerful effect on the character of its people. The Breton has generally a tinge of melancholy in his disposition; but often conceals, under a dull and indifferent exterior, a lively imagination and strong feelings. "The tenacity with which the Breton clings to the habits and belief of his forefathers, is apparent by his retention of the Celtic language almost universally in Basse B., and by his quaint costume, which in many districts is that of the 16th century." The greater number of the people are found to be ignorant and coarse in their manners, and their agriculture is of a very rude character, by no means calculated to develop the natural resources of the country. Until within recent years, B. had escaped the observation of tourists; but it has now been found out, and seems likely to be considerably run upon, as well as to have a pretty extensive literature of its own. It will be some time yet before it is exhausted, and apart from the beauty of its scenery, it possesses great interest, as the only place where men can be seen living and acting much as our forefathers did three centuries ago. Under the Romans, the country, after 58 B.C., was made the *Provincia Lugdunensis Tertia*; but its subjugation was hardly more than nominal, and it was entirely liberated in the 4th c., when it was divided into several allied republican states, which, afterwards, were changed into petty monarchies. B. became subject to the Franks in the reign of Charlemagne, and was handed over by Charles the simple to the Northmen in 912. After some fierce struggles, the Bretons appear to have at length acknowledged the suzerainty of the Norman dukes. Geoffroi, count of Rennes, was the first to assume the title of duke of Bretagne in 992. The duchy of B. was incorporated with France in 1532, by Francis I., to whom it had come by marriage, and subsequently shared in the general fortunes of the empire, but retained a local parliament until the outbreak of the revolution. During the revolution, B., which was intensely loyal, was the arena of sanguinary conflicts, and especially of the movements of the Chouans (q.v.), who reappeared as recently as 1832. Daru, *Histoire de B.* (Par. 1826); Roujoux, *Histoire des Rois et des Ducs de B.* (Par. 1829); Courson, *La B. du 5^e au 12^e Siècle* (1868); Le Saint, *La B. Ancienne et Moderne* (1873); De Kerorguen, *Recherches sur les Etats de B.* (1875).

BRETHREN, WHITE, a sect of the 15th c. that sprang up in the Italian Alps. Their leader claimed to be Elias the prophet; they were clad in white, and carried crucifixes from which blood appeared to come. The leader, who appears to have left no name, prophesied the destruction of the world, and for a time had great success; but Boniface IX. seized the prophet and burnt him at the stake, and within a year the sect passed out of existence.

BRETHREN AND CLERKS OF THE COMMON LIFE, OR OF THE COMMON LOT. See **BROTHERHOODS, RELIGIOUS, ante.**

BRETHREN AND SISTERS OF THE FREE SPIRIT, OR SPIRITUALISTS. See **BEGUINES, ante;** and **BROTHERHOODS, RELIGIOUS, ante.**

BRETHREN OF THE CHRISTIAN SCHOOLS, an order established at Rheims in 1679, and sanctioned by Benedict XIII. in 1725, having for its object furnishing the poor with instruction. In Paris, in 1792, they refused to take the oath of obedience to the civil constitution, and were driven from their houses and prohibited from teaching. In 1801, they returned and soon spread over France, Italy, and other countries. About 1830, they opened evening schools for adults. Their chief house is in Paris, and in 1868 they had more than 10,000 brethren, teaching 300,000 persons in France alone. There are a number of them in the United States.

BRETHREN OF THE HOLY TRINITY, a society of the 12th c., in France, whose members were pledged to give a third of their revenues towards the redemption of Christians who were in Mohammedan or infidel slavery.

BRETIGNY, a village of France, in the department of the Eure-et-Loir, about 6 m. s.e. of Chartres, on the railway between Paris and Orleans. B. is celebrated as the place where, in 1360, Edward III. concluded a peace with France, by which John II. of France was released from his captivity in England, on agreeing to pay 3 million crowns for his ransom, England renouncing her pretensions to Normandy, Anjou, Maine, and Touraine, and being confirmed in her possession of Gascony, Guienne, and several other parts in France recently acquired by conquest.

BRETON, JULES ADOLPHE, a French painter of the present day, excelling in rural life and scenes, for which he has received medals. Among his works are "The Gleaners," "Evening," "Blessing the Grain," "The Weeders," etc.

BRETON DE LOS HERREROS, DON MANUEL, the most popular of modern Spanish poets, was b. 19th Dec., 1800, at Quel, in the province of Logroño; received his earliest education in Madrid; and served as a volunteer in the army from 1814 to 1822. Subsequently, he held several situations under government, but always lost them on account of his expression of liberal opinion. As early as his 17th year, he wrote a comedy,

entitled *A la Vejez Virtuella*, which, in 1824, was brought upon the stage with great success. Henceforward he furnished theatrical managers with more than 150 pieces, partly original, partly adaptations from the older Spanish classics, and partly translations from the Italian and French, most of which have been highly popular. In addition to these, Breton de los Herreros published *Poesias Sueltas* (Madrid, 1831, and Paris, 1840); several volumes of satirical verse; a long humorous poem, called *La Desvergüenza*, *Poema Jocosario* (Madrid, 1858), etc. All Breton de los Herreros's poems are remarkable for their singularly sweet, yet powerful diction, and for the harmony of the versification. His peculiar sphere is the comic and the satirical, in which the Spanish or national qualities of his genius find their freest expression, and in which also he displays most ease and self-reliance. Breton de los Herreros superintended the issue of a collected edition of his poetical works in 1850-52 (5 vols., Madrid). He died at Madrid in Nov., 1873.

BRETSCHNEIDER, HEINRICH GOTTFRIED, a man remarkable for his unsettled life, eccentric habits, and satirical writings, was b. at Gera, Mar. 6, 1739. He was first sent for education to the institute of Herrnhuters at Elbersdorf, and afterwards to the gymnasium at Gera. He became capt. of horse in a Prussian volunteer corps, in which service he was made prisoner, and retained in a French fortification till 1763. In 1775, B. visited England, France, and Holland; and in 1778 was nominated librarian to the university of Ofen, where he was persecuted by the Jesuits, whose hatred he had excited. This circumstance brought him under the notice of Joseph II., who, in 1782, appointed him one of the inspectors of studies. He died in Nov., 1810. B. was the author of tales, poems, and satires. The latter are attacks upon every kind of injustice and falsehood. In his "Almanac of the Saints (*Almanach der Heiligen*) for the year 1788, with copper-plates and music, printed at Rome, with the permission of the principals," the priesthood is severely attacked, and the legends of the monks ridiculed. Like Nicolai, B. was very bitter against the "Werther" mania which was so prevalent in his time.

BRETSCHNEIDER, KARL GOTTLIEB, a distinguished German theologian, b. 11th Feb., 1776, at Gersdorf, in Saxony, studied theology at Leipsic, was appointed pastor at Schneeberg in 1807, general superintendent at Gotha in 1816, and in 1840 obtained the dignity of a councillor of the upper consistory. He died 22d Jan., 1848. B. has acquired a reputation for sober, reflective, rationalistic thought. The character of his intellect rendered him unable to enter into the profound speculations of men like Schleiermacher and Schelling; but nevertheless, by his diligence, clear, incisive understanding, and strength of character, he has secured a permanent place in the history of German theology. His most important work in dogmatics is the *Manual of the Evangelical Lutheran Church* (2 vols., Leip. 1814-18). In 1824, B. published *Lexicon Manuale Græco-Latinum in Libros Novi Testamenti* (2 vols., Leip. 1824). In 1832, appeared *Der Simonismus und das Christenthum*; in 1835, *Die Theologie und die Revolution*. B. also published many sermons, which have been well received, and in other departments of theology and literature he is considered to have done important service.

BRETT, PHILIP MILLEDOLER, D.D., 1817-60; b. New York; a graduate of Rutgers college; ordained in the Dutch Reformed church in 1848, and held pastorates in various places near New York. A volume of his sermons is in print.

BRET TEN, a t. of Baden, about 13 m. e. of Carlsruhe, chiefly noteworthy as the birthplace of Melancthon. The house in which he was born is pointed out to travellers. Pop. '71, 3433.

BRETT'S AND SCOTS, THE LAWS OF THE (Lat. *Leges inter Brettos et Scotos*, old Fr. *Lusage de Scotis et de Bretis*), the name given, in the 13th c., to a code of laws in use among the Celtic tribes in Scotland. The "Scots" were the Celtic people dwelling in the western and more mountainous districts n. of the Forth and the Clyde, who, when it became necessary to distinguish them from the Teutonic inhabitants of the low country, received the names of "the wild Scots," "the Irishy of Scotland," and, more recently, "the Scotch highlanders." The "Bretts" were the remains of the British or Welsh people, who were at one time the sole or chief inhabitants of the region now divided into the shires of Dumbarton, Renfrew, Ayr, Lanark, Peebles, Selkirk, Roxburgh, Dumfries, and Cumberland. This province was for some centuries an independent kingdom, known by the names of "Cambria," "Cumbria," "Strathclyde," and "Strathclyde and Reged." It became, about the middle of the 10th c., a tributary principality held of the king of the English, by the heir of the king of the Scots. It so continued till after the beginning of the 12th c., when Cumberland having been incorporated with England, the gradual absorption of the rest of the territory into the dominions of the king of the Scots seems to have been imperceptibly completed. The last "prince of Cumbria" named in record was the brother and heir of king Alexander I. of Scotland, "the earl David," as he was called, who, on his brother's death in 1124, himself became king of the Scots. No more is heard of Cumbria as a principality; but "the Welsh" continue to be named among its inhabitants, in the charters of king David's grandsons—king Malcolm the maiden (1153-65), and king William the lion (1165-1214). And they seem to have retained more or less of their ancient Celtic laws until after the

beginning of the 14th century. It was not till the year 1305 that an ordinance of king Edward I. of England, who appeared then to have reduced all Scotland to his subjection, decreed "that the usages of the Scots and the Bretts be abolished, and no more used." It is unknown how far this prohibition took effect. Of the code which it prescribed, only a fragment has been preserved. It was first printed by sir John Skene, in his *Regiam Majestatem* (Edin. 1609). But by far the best edition is that of Mr. Thomas Thomson and Mr. Cosmo Innes, in the *Acts of the Parliaments of Scotland*, vol. i. pp. 299-301 (Edin. 1844), where the laws are given in three languages—Latin, French, and English. The French version, which is the oldest, is printed from a manuscript of about 1270, formerly in the public library at Bern, in Switzerland, now in the register house at Edinburgh. The fragment of the "laws of the Bretts and the Scots" thus published, is of much the same nature as the ancient laws of the Anglo-Saxons, the Welsh, the Irish, and other nations of Western Europe. It fixes the *cro*, or price at which every man was valued, according to his degree, from the king down to the churl, and which, if he were slain, was to be paid to his kindred by the homicide or his kindred. The cro of the king was 1000 cows; of the king's son, or of an earl, 150 cows; of an earl's son or of a thane, 100 cows; of a thane's son, 66½ cows; of the nephew of a thane, or of an ogthiern, 44 cows and 21½ pence; and of a villain or churl, 16 cows—all persons of lower birth than a thane's nephew, or an ogthiern, being accounted villains or churls. The cro of the married woman was less by a third than the cro of her husband. The cro of the unmarried woman was as much as the cro of her brother. Other chapters fix every man's *kelchyn* or *gelchuch*, *gallues*, and *enauch*—Celtic terms not yet satisfactorily interpreted, but apparently equivalent to the *fyhtwite*, *mund*, and *manbot* of the Anglo-Saxon, as the *cro* of the Bretts and Scots appears to answer to the *werigild* of the English. A chapter "of blood-drawing"—corresponding with the *bloddyte* of the Anglo-Saxons—fixes the fine to be paid for a blow to the effusion of blood, according to the degree of the person wounded and the place of the wound.

BREUGHEL, the name of a famous family of Dutch painters.—PETER B., the head of the family, was b. in the village of B., near Breda, in 1510 (or, as others say, 1530), and d. at Brussels in 1570 or 1590. He was a scholar of Peter Koeck van Aelst, traveled through Italy and France, and on his return, fixed his residence at Antwerp. He painted chiefly the pleasures of rustic life, for which he himself had a great relish, and which he transferred to his canvas with clear insight and vivid coloring, though unnecessarily exceeding at times the coarseness of his subject. He also executed several historical pieces, such as his "Building of the Tower of Babel," now preserved in the gallery at Vienna.—His son, PETER B., distinguished by the strange title "Hellish Breughel"—because he loved to paint scenes in which the leading characters were devils, hags, robbers, etc.—was b. about 1569, and d. 1625. His paintings of "Orpheus" and the "Temptation of St. Antony" are the most remarkable of his pieces.—JAN B., brother of the preceding, and on account of the splendid apparel which he wore when he became rich, usually called Velvet B., was b. 1568 or 1575, and d. 1625 or 1640. He was an industrious painter, distinguished for his landscapes and for his minute finish of small figures. In concert with Rubens, who supplied the two chief figures, he painted "Adam and Eve in Paradise," and "Vertumnus and Bellona." These, with the "Four Elements," are his chief works.—Other members of the same family were known as painters: AMBROSE B., director of the academy of painting, Antwerp, between the years 1635 and 1670; ABRAHAM B., a painter of fruits, flowers, and birds, lived long in Rome and Naples, where he d. in 1690; JAN BAPTIST B., b. in Rome, d. 1700; and finally, CASPAR B., both of whom were flower-painters.

BREWARD, a large co. in s.e. Florida, on the Atlantic ocean; 5600 sq. m.; pop, '70, 1216. It is low, flat, and full of lakes and marshes. Along the coast is Indian river, an inlet of the ocean. There is little cultivation and there are no large villages.

BREVE. See ANT-CATCHER.

BREVE, a note in music, which, in the old notation of Guido d'Arezzo, had the value of two whole bars. It is written thus, \sqcap , or \sqsubset , or \sqsupset . The note for a whole bar in modern notation is called semibreve, and has the value of four crotchets. In triple time, the B. contained three semibreves. The B. is now only used in a *la capella* movements, psalm-tunes, and fugues, or at the close of a composition.

BREVE, or **BRIEVE**, in the practice of the Scotch law, is a writ issuing from chancery in the name of the crown, to a judge, ordering him to try by jury the points or questions stated in the breve. In ancient times, these writs appear to have been the foundation of almost all civil actions in Scotland; but they are now only used in the following cases: 1. B. of inquest, now, however, superseded by a petition of service, according to the 10 and 11 Vict. c. 47. The object of the proceeding is judicially to ascertain the heir of a deceased person. 2. B. of tutory, the purpose of which is the appointment, as guardian to a pupil, of the nearest agnate or person most nearly related through the father. 3. Breves of idiocy and furiosity, by which the mental condition of a party may be determined for the appointment, in case of ascertained insanity, of a guardian or curator. In the B. of idiocy, the direction is to inquire whether the person is of unsound mind, furious, and naturally an idiot. In the breve of furiosity, it is whether

he be of unsound mind, prodigal, and furious. 4. B. of terce. The object of this writ is to "cognosce the widow to her terce"—that is, to enable her to recover her terce or dower. It is issued to the sheriff of the county, and the jury under his presidency are directed to inquire whether the claimant was the lawful wife of the deceased, and whether the husband died infeft in the lands from which the terce is claimed. The verdict of the jury gives the widow her terce, and the judge then "kens" her to it. See TERCE, and KENNING TO THE TERCE. 5. B. of division amongst heir-portioners. By means of this B., an heir-portioner—that is, one of two or more sisters succeeding in equal portions to a landed estate—may have her share of the lands separated or set apart by a judge, who appoints an inquest, or jury of fifteen persons, to measure the land, and make a division; the jury report to the judge; and lots being cast for the different shares, the judge decides accordingly. The form is, however, now seldom used, an arbitration being more generally resorted to. See INHERITANCE, SUCCESSION, HEIRS-POR-TIONERS.

BREVET (Fr. a writ or warrant), in the British army, is a promotion of officers, now strictly limited in its application, but before 1854 a recognized though occasional mode of conferring a large measure of general promotion throughout the army. It took place under various circumstances. If no special cause interfered, a general promotion by B. used in former times to be made once in about six years; but in more recent years it was limited to very special occasions, as a coronation, the birth of an heir to the throne, the termination of some great war, etc., and was limited to officers who had some particular claim to promotion. The officers so promoted obtained an increase of rank, and in some cases pay, even if they had never served in the field. A B. was determined on by the cabinet, and carried out by the commander-in-chief. The officers expected it, as one of the implied conditions on entering the service, and it had formed part of the British military system ever since the time of James II.; but it was unsatisfactory, because the flow of promotion caused by it was arbitrary, uncertain, and much liable to abuse. There were brevets, arising out of the various circumstances above indicated, in 1837, 1838, 1841, 1846, 1851, and 1854. On these occasions, lieut.-generals, maj.generals, colonels, lieut.colonels, majors, and captains received a promotion of one grade in rank. On one of these occasions, 200 colonels were at once made maj.generals. The higher the rank, the higher the pay, as a general rule; and therefore the cost to the nation is always increased for a time after each brevet. Thus the B. of 1837 occasioned an annual increase of £11,000; that of 1838, £7000; of 1841, £15,000; of 1846, £21,000, etc.; but it must not be forgotten that death and sales had in the intervals cleared off perhaps an equal number of officers at the higher rates of pay. In 1854, the new maj.generals alone involved an additional charge of £18,000 a year.

The above description applied before 1854. In that year, general brevets were abolished—a fixed establishment of general officers being substituted. The only brevets now are obtained by service of five years as lieut.col. (making the officer brevet col., without increase of pay); by distinguished service in the field, applicable to lieut.colonels, majors, and captains (carrying the substantive pay of the higher rank, except in the case of the lieut.col.); and by succession, when a death occurs among the establishment of general officers. In this last case there is no brevet promotion to the rank of col., but the senior maj. in the whole army and marines becomes a brevet lieut.col. without increase of pay, and the senior capt. a brevet-maj. with 2s. a day extra. Officers become maj.generals, in accordance with their seniority as brevet colonels, and it will be seen, from the above description, that the brevet rank of col., which is the stepping-stone to maj.gen., is obtainable *by service only*.

Other matters having reference to this subject will be found treated under the article COMMISSIONS, ARMY.

As brevet was neither purchasable nor salable, the abolition of the purchase-system made no alteration.

There is no B. promotion in the navy.

BREVET (*ante*), in the U. S. army, a commission giving an officer a nominal rank higher than that for which he has a salary. A great number of these honorary titles were bestowed during and after the civil war.

BREVIARIUM ALARICANUM, a collection of Roman laws compiled by order of Alaric II., king of the Visigoths, in 506 A.D. The chief value of this compilation is that it preserves the first five books of the Theodosian code and five books of the *Sententiæ Receptæ* of Julius Paulus, which are nowhere else found.

BREVIARY. By this title we are to understand an *abbreviation*, as well as an amended arrangement of the more ancient offices used at the seven canonical hours, which are matins, prime, terce, sext, nones, vespers, and compline. See CANONICAL HOURS. The books in which these offices were contained were formerly distinct—viz.: 1. The *Psalter*, which included the Psalms of David according to St. Jerome's Galbian version, the Te Deum, the Athanasian creed, etc.; 2. The Bible; 3. The *Antiphonarium*, containing the anthems and responsories; 4. The *Hymnarium*; 5. The *Collectarium*, or the collects to be said at the end of the services; 6. The *Homiliarium*, *Passionarium*, and

Martyrologium, containing the comments of the fathers upon the gospel of the day, and accounts of the martyrdoms of the saints for each distinct festival. Out of all these separate books, the B. was compiled, about the 11th c., by pope Gregory VII., as is supposed; the lessons, anthems, hymns, and responsories for the different days of the year being all arranged, in their proper places, in the same volume with the psalter, prayers, etc. In later times, the B. was divided into two parts, one for each half of the year, as was the case with those of Salisbury, York, and Hereford, used in England; and afterwards into four parts, so as to be more portable, whence it was also called *Portiforium*. It may perhaps be necessary to inform our Protestant readers that the B. is an entirely distinct book from the Missal (q. v.), the latter containing the proper offices for the service of the sacrifice of the mass.

The last settlement of the B. was under the pontificate of Pius V., and his bull of 1568 was that by which the present daily office of the Roman church is authorized. This edition was compiled by the college of sacred rites at Rome, in conformity with the decrees of the council of Trent, because of the variety of *uses*, as they were called, which at that time existed in different dioceses. The bull of Pius V. abolished the use of all breviaries, except such as could prove a prescription of 200 years. This exception would have extended to the breviaries of Salisbury and York, if the church of England had not already thrown off Rome's supremacy, and compiled a new book of common prayer for herself. After this, in 1602, Clement VIII. had a standard edition printed at the Vatican, to which all future editions were to conform; and again, in 1631, Urban VIII. caused the meters of the hymns and the Latinity of the whole to be carefully revised. It is perhaps hardly necessary to state that the B. is in Latin, portions of it being sometimes translated for the use of the unlearned. It is necessarily a very bulky volume, when complete; and although some of the legends of the saints and martyrs may be of doubtful authenticity, yet it is a mine of interesting and devotional reading. Its general contents may be judged of from what has been already stated as to the sources from which they were drawn, every saint in the calendar having his proper services for the different canonical hours. The festivals of the Roman church have their services, according to their importance, duplex, semi-duplex, or simplex—i. e., double, semi-double, or simple; these, again, are further distinguished, so that there are no less than 9 classes of services—the Ferial or ordinary week-day, the simple, the day with an octave, the semi-double, the dominical or Sunday, the double, greater double, double of the second class, double of the first class. Indeed, so elaborate and perplexing are the rubrical directions, that it is impossible to form any idea of them without consulting the B. itself, and there are probably but few of the priests who are thoroughly conversant with their own ritual.

The B. contains, besides an office for the dead and other smaller offices, three kinds of office in honor of the blessed Virgin Mary—viz.: 1. The full office, said on such festivals as the Purification, Annunciation, Immaculate Conception, Assumption, etc.; 2. the office of the Virgin Mary on Saturdays; 3. What is called the "little office," or the hours of the Virgin. This last was in use as early as the 7c., and was enjoined by the council of Claremont, 1096, to be said by the clergy daily, and by the laity on Saturdays, but the bull of Pius V. removed this obligation except as to clergy in choirs. The Roman church enjoins, under pain of excommunication, all "religious" persons—i. e., all persons, male or female, who have taken vows in any religious order—to repeat, either in public or private, the services of the canonical hours as contained in the breviary. For the influence of the old breviaries on the English common prayer-book (q. v.), consult Palmer's *Antiquities of the English Ritual*, and Maskell's *Monumenta Ritualiæ*. The matins or morning-prayer of the English prayer-book is an abridgment, with many omissions and additions, of the matins, lauds, and prime of the B., whilst the office of even-song, or evening-prayer, is in like manner an abridgment of the ancient vespers and compline.

BREVIPENNES (Lat. short-winged), in ornithology, according to the system of Cuvier, that tribe of the order *grallatores* (q. v.) in which the ostrich, cassowary, rhea or nandon, emu, and apteryx are comprised, and also the extinct dodo.—See these articles. The B. are characterized by a shortness of wing which incapacitates them for flight, but use their wings to aid them in running, which they do with great rapidity. Their *sternum* (breast-bone) has no ridge or keel. They constitute the family *struthionidæ* of many ornithologists, and by some are placed among gallinaceous (q. v.) birds, to which they are allied by the form of their bill and their choice of food. They are, however, very different from all other birds, and whether ranked among grallatores or gallinaceous birds, do not seem to form a natural part of the order. The gigantic *dinorix* (q. v.) and other fossil birds of great interest exhibit the characters of the *brevipennes*.

Gigantic birds, of which the footsteps appear imprinted on sandstones in the valley of the Connecticut and elsewhere, seem also to have belonged to this tribe. No remains or traces of such birds are, however, found nearly so ancient as many remains of quadrupeds. But to whatever geological period the commencement of their existence is to be referred, a peculiar interest is attached to them, because its close may be regarded as probably near. There is no tribe of birds that more generally shuns man, or disappears before the increase of population and the progress of colonization. The cassowary and the emu are rapidly becoming rare. The ostrich, the rhea, the apteryx, the notornis, etc., are only found in deserts or other deep solitudes.

BREVI-PENNES, or **BREVI-PENNATES**, meaning "short-winged," a term for such birds as the ostrich, cassowary, apteryx, and others having very short wings, not fitted for flying. Such birds usually live in solitary places or deserts.

BREWER, a t. in Penobscot co., Me., on the Penobscot river, opposite the city of Bangor, on the Bucksport and Bangor railroad; pop. 3214. It has lumber and leather manufactories.

BREWING. For the process of B. see **BEER**. The legal requirements for the B. of beer for sale will be found in many acts of parliament, from the 12 Chas. II. c. 24, to 33 and 34 Vict. c. 32 s. 10, changes being of late frequent. Instead of licenses to brew, as formerly, duties are levied on the quantity of beer brewed, according to a scale which ranges from a quantity not exceeding 20 barrels to one that shall exceed 40,000 barrels, the duty itself beginning at 10s., and rising up to £75, according to the quantity. In the case of that kind of beer called *table beer*, it is provided that the duty on such shall in no case exceed £2, no matter how large the quantity brewed may be. Brewers are not to retail or sell beer at any other place than their licensed B. premises, and if they wish to sell beer at other places, they must get a license for these places also; but it is provided that the taking orders for the sale of beer in any quantity amounting to or exceeding 4½ gallons, or two dozen reputed quart bottles at one time, sent to the purchaser direct from the B. premises, shall not be deemed a selling of beer at any other place. Several of the above acts (the 13 and 14 Vict.) contain provisions respecting the duties to be levied on sugar used in B., providing that such duties shall be at the rate of 1s. 4d. for every cwt. of sugar; and brewers are to make true entry, in the book kept for that purpose by the excise, of the quantity of sugar, in pounds-weight avoirdupois, used in B., under a penalty of £200, over and above any other penalties to which they may be liable. The acts contain numerous other regulations, too minute for further detail here. See **BEER**, **BEER ACTS**, **LICENSES**.

Anciently, in Scotland, the privilege of B. was given by a license from the superior or lord, in whose deed of gift or charter to his vassals there was generally a clause *cum brueriis*. But these forms have long been dispensed with. It appears, however, that a person with the right of barony may prevent a feu, that is, a tenant of property within the barony or a stranger, from importing and vending ale within the baronial limits without his license.

BREWSTER, Sir **DAVID**, an eminent natural philosopher and eloquent writer, was b. at Jedburgh, Dec. 11, 1781. He was educated for the church of Scotland at the university of Edinburgh, where he highly distinguished himself. In 1808, he undertook the editorship of the *Edinburgh Encyclopædia*, to which he contributed many important scientific articles. Previous to this, he had entered deeply on the study of optics, with which his name is now enduringly associated. The beautiful philosophical toy, called the kaleidoscope, was invented by him in 1816. In 1819, in conjunction with prof. Jameson, he established the *Edinburgh Philosophical Journal*; and in 1831 he was one of the chief originators of the British association for the advancement of science. The honors conferred on this distinguished man make up a long catalogue. In 1815, he obtained the Copley medal of the royal society for one of his optical discoveries, and soon after was elected a fellow; in 1816, he received half the physical prize bestowed by the French institute for two of the most important scientific discoveries made in Europe during the two preceding years; in 1819, the royal society awarded him the Rumford gold and silver medals, for his discovery on the polarization of light; in 1825, he became corresponding member of the institute of France; in 1832, he was knighted, and had a pension conferred upon him; in 1838, he was chosen principal of the united colleges of St. Leonard and St. Salvador. St. Andrews; in 1849, on the death of Berzelius, in the preceding year, he was elected one of the eight foreign associates of the French institute, the highest scientific distinction in Europe. Sir David was also a member of the imperial and royal academies of St. Petersburg, Berlin, Copenhagen, and Stockholm; presided over the British association, and in 1851, over the peace congress held in London. In 1859, on the death of Dr. John Lee, he was chosen principal of the Edinburgh university. His principal work is his *Life of Newton*, first published in 1828, in the *Family Library*, and issued in a totally new and greatly enlarged form in 1855. Among his other works are his interesting *Letters on Natural Magic*, addressed to sir Walter Scott, also published in the *Family Library*; *More Worlds than One* (1854); his treatises on the kaleidoscope and on optics (*Cabinet Cyclopædia*); his *Martyrs of Science*; and his treatises in the *Encyclopædia Britannica* on electricity, magnetism, optics, the stereoscope, etc. Among other periodicals to which he contributed largely are the *Edinburgh* and *North British Reviews*. He died Feb., 1868. See *Home Life of B.* by his daughter, Mrs. Gordon (1869).

BREWSTER, **WILLIAM**, 1566-1644; b. England; one of the pilgrims who landed at Plymouth. He went with Bradford to Holland, where he taught school in English, became an elder in the church, and held the same position in New England, though, as he had never been ordained, he could not be persuaded to administer the sacraments. He is more generally known in history as "Elder Brewster."

BREZO WA, a market t. of Hungary, in the co. of Neutra, on a river of the same name, about 19 m. n.w. of Leopoldstadt. It has a Roman Catholic church and a Protestant church, tanneries, and distilleries. Pop. '69, 5886.

BRIALMONT, HENRI ALEXIS, b. 1821; a Belgian engineer and military writer, and member of various learned societies. He has published a number of works on the art and methods of military fortifications, on which he is accepted as one of the best authorities.

BRIAN BOROIMHE (pron. *boru'*), a famous king of Ireland, ascended the throne of both Munsters—answering to the present counties of Tipperary and Clare—in 978. Some time afterwards, he deposed O'Maelachaghlin, and became supreme ruler of Ireland. The surname, Boroimhe, signifying tax, was given him in consequence of the tribute in kind he levied from the various provinces. King Brian supported a rude but princely state at his chief castle at Kincora, a place in the neighborhood of the modern town of Killaloe, and he had also seats at Tara and Cashel. The vigor of his reign brought prosperity to his country. He defeated the Danes in upwards of 20 pitched battles, restricting their influence to the four cities of Dublin, Wexford, Waterford, and Limerick alone. In the battle of Clontarf (1014), in which he was killed, he gained a signal victory over a united army of revolted natives and Danes, the power of the latter receiving a shock from which it never recovered.

BRIANCON (ancient *Brigantium*), a t. of the department of the Hautes-Alpes, France, on the right bank of the Durance, about 35 m. n.e. of Gap. It is the highest town in the French empire, being situated at an elevation of nearly 4300 ft. above the sea-level. As the principal arsenal and depot of the French Alps, B. is very strongly fortified, while several forts guard the approaches, and every height in the vicinity is a point of defense. It is considered impregnable. Troops can readily be marched from it on to the passes of the Simplon, St. Bernard, Mont Cenis, and the Col de Tende. Mont Genève affords a practicable passage into Italy from the town itself. B. has some manufactures of cotton-goods, hosiery, cutlery, crayons, etc. Pop. '76, exclusive of garrison, 2321.

BRIANSK', a t. of Russia, in the government of Orel, 70 m. w. of the city of that name. It is situated on the right bank of the Desna, is surrounded with earthen ramparts, and has a considerable trade in grain, hemp, wax, linen, cables, cordage, iron, etc., with Kherson, Odessa, and other ports on the Black sea. B. has a cannon-foundry and 13 churches. Pop. '67, 13,881.

BRIARE, a t. in the department of Loiret, France, situated on the right bank of the Loire, at the point where the canal de Briare enters that river, about 43 m. s.e. of Orleans. The canal, which unites the Loire and the Seine, is remarkable as the first that was constructed in France, having been begun by Sully, and finished in 1642. B. has a considerable trade in wine, wood, and charcoal. It is supposed to occupy the site of the ancient *Briodurum*. Pop. '76, 3970.

BRIA'REUS, or *ÆΓΕΩΝ*, one of the three sons of Uranus and Gaia; the others were, Cottus and Gyges, and each of the three had a hundred arms. They assisted Zeus when the Titans made war against Olympus. One account represents B. as assailing Olympus and being defeated and buried under Mt. Etna. As B. is sometimes called a marine deity, it has been thought probable that the hundred arms symbolized the waves of the sea.

BRIBERY. The corrupt practices known by the term B. might well form the theme of an extended essay. Here we can point only to a few of the more conspicuous features of this grave social disorder, and chiefly as concerns B. at elections.

Election B., a well-known form of corruption, may be called the canker and disgrace of constitutional government. Individuals, with little to recommend them but wealth, and it may be some local distinction, wishing to be elected representatives in the legislature, do not scruple, through various devices, to buy the votes of the meaner order of electors by bribes. B. at elections is perhaps more openly and audaciously practiced in various parts of the United States than it is in England; nor are base influences of this kind unknown in connection with the more meager constitutional forms of some continental states. But in the eye of the world, England had the unenviable notoriety of being the country in which B. was reduced to a regular and continuous, though covert, system. It had been demonstrated by parliamentary inquiry, that masses of the population in certain towns—more particularly the class called freemen—look upon the franchise as a privilege which, for personal benefit, entitles them to exact so much money for their votes. Public considerations had no weight with them whatever. It seemed to them to be alike their duty and their interest to sell their votes to the highest bidder. The earl of Dundonald mentions in his *Autobiography*, that when, as lord Cochrane, he offered himself as a candidate for Honiton, he was barefacedly told by one of the electors, "that he always voted for Mister Most;" and not choosing to bribe, he lost his election. The amount of bribe ordinarily paid at elections in this venal class of boroughs, varied from £1 to £10, according to circumstances; as high a sum as £20, and even £50, had been known to be given in the extremities of a contest. For these corrupting and disgraceful practices, the law threatens certain penalties; but to avoid incurring these,

as well as for the sake of decency, the candidates employed a mean class of agents, or were in some obscure way assisted by confederates, of whose proceedings it was difficult to substantiate any guilty knowledge on their part. The agents more immediately concerned did the business of bribing in private, sometimes in darkened apartments, where no one could be seen. Formerly, the treating of voters in taverns was added to other varieties of corruption, and the demoralization that ensued on occasions of this kind amounted almost to a universal saturnalia. The law having interposed to check this gross form of B., the evil had latterly subsided into a common-place routine of secret money-dealings. Of course, by this illegal expenditure, along with the necessary outlays which the law allows, the cost of an election was in many cases enormous. Few seats of English borough members cost less than £1800; but double and triple this sum was a common outlay. It is a well-known fact, that for certain boroughs any man—no matter what be his political opinions or private character—might be returned by advancing £4000, and asking no questions as to what was done with it. As the B. was on both sides, it may be safely averred that the money spent at some contested elections amounted to £10,000. As regards elections for counties, the influences brought to bear are ordinarily of a different kind; but though morally wrong, they do not come within the scope of the present article. The Scotch have some reason to boast that their country is comparatively exempt from this social disorder—that their representatives are not so deprived as to offer, nor the electors so weak and needy as to accept, money-bribes. Such may be said as a general truth. Unfortunately, however, the national integrity is in this respect not quite unblemished, for the member returned for the Falkirk burghs, in 1857, was unseated for bribery. To avert every form of corrupt influence, the ballot (q. v.) was long vehemently urged; and an act to secure the use of the ballot in parliamentary and municipal elections throughout Great Britain and Ireland was finally passed in July, 1872. So far bribery seems to have been almost unaffected by the ballot act. The improved mode of trying election petitions by judges has worked well. See CORRUPT PRACTICES ACT, and PARLIAMENT.

BRIBERY IN MUNICIPAL ELECTIONS. By the corrupt practices (municipal elections) act, 1872, the offense of B. is put on the same footing as in parliamentary elections. The guilty person is forever disabled from voting at other municipal elections, and also from holding any office or franchise in the borough. See MUNICIPALITY.

BRIBERY OF CUSTOM-HOUSE AND EXCISE OFFICERS. By the customs consolidation act, the 16 and 17 Vict. c. 107, s. 262, every person who shall give or offer any bribe, or make any collusive arrangement with any officer of customs or excise, or other person employed for the prevention of smuggling, in order to induce him to neglect his duty, shall forfeit the sum of £200. A former act, passed in 1827, the 7 and 8 Geo. IV. c. 53, s. 12, still in force, specially enacts in the case of the excise, that persons in such service taking money or reward, or entering into any collusive agreement contrary to their duty, shall for every such offense forfeit the sum of £500, and be incapable of serving the crown in any office or employment; and any person giving or offering money or reward to excise officers, in order to corrupt and prevail upon them, shall forfeit the like sum of £500, but simply and without any further penalty of disqualification.

BRIBERY OF JUDGES. This offense in the old Scotch law was called **BARRATRY** (q. v.)

BRIBERY (*ante*), in general the same here as in England, and always a crime difficult to prove and more difficult to punish. It is defined as the receiving or offering any improper reward by or to any person, that may in any way relate to the administration of justice, or influence behavior in a matter of official duty, or lead the person to act contrary to the common rules of honesty and integrity. Nearly all the states have special statutes and severe penalties for the offense.

BRICK. The earliest examples of this branch of the ceramic art were doubtless the sun-dried bricks of Egypt, Assyria, and Babylonia. Remarkable to say, many of these, which, in a northern climate, the frosts of a single winter would destroy, have been preserved for some 3000 years by the dry, warm atmosphere of those countries. Sun-baked bricks of ancient date are also found in the mud walls of old towns in India. Kiln-baked bricks must have been the products of a later time; but they are found in all the chief ruins of ancient Babylonia, where they were often used to face or bind together walls of sun-dried bricks, and occasionally they were even ornamented with enameled colors. Burnt bricks were employed in the foundations of the tower of Babel (Gen. xi. 3). These ancient bricks, whether baked by the sun or by fire, were all made of clay mixed with grass or straw. The ancient Greeks, probably owing to their possessing plenty of stone, cared little for building with burned clay; but most of the great ruins in Rome are built of brick, and the Romans appear to have introduced the art into England. Interesting historical information has been obtained from the impressions on Roman and especially on Babylonian bricks. In many instances, the Roman bricks found in England have been removed from their original position, and employed in the construction of buildings of later date. The earliest instance in which bricks of the modern or Flemish make occur in England, is Little Wenham hall, in Suffolk, 1260.

Manufacture of Bricks.—Clay suitable for the manufacture of common bricks is an abundant substance, but there is a great difference in the nature and quality of the clays found in various localities. The basis of clay consists of hydrated silicate of alumina,

with a varying proportion of other mineral matters, chiefly free silica (sand), iron, lime, magnesia, and potash. Great advantage is derived from digging clay in autumn, and exposing it all winter to the disintegrating action of frost. This is not always attended to, but when neglected, the bricks made from it are apt to be unsound, and faulty in shape. The next process is that of tempering or mixing the clay into a homogeneous paste, which is sometimes done by the spade, but more commonly in the pug-mill (see article Pottery) or by crushing between a pair of rollers; often, indeed, both are employed. In making bricks by the old hand process, the shape is given by a mold either entirely of wood, or of wood faced with metal, and without top or bottom. This admits of the clay being pressed into it by a tool called a plane, which is also used to produce an even surface on the upper and lower beds of the brick, by working off the superfluous clay. Sand is used to part the wet clay from the mold and the table on which it rests.

Although hand-made bricks are still very common, yet machinery is now always employed when large quantities are required. Brick-making machines are of two leading kinds; one class of them being constructed to work the clay in a wet plastic state, the other class requiring it to be in a semi-dry condition. Of the two sorts, the wet-clay machines are the simpler, cheaper, and can be worked by less-skilled workmen. On the other hand, the dry-clay machines, which make the bricks by forcing the clay into molds by strong pressure, shorten the process, as no time is required for drying them. The bricks so made, too, are not only of a more perfect shape, but they can be molded into any form, and may even be made highly ornamental at a very slight additional cost.

As might be expected, both the dry and the wet-clay machines of different makers vary considerably in their details. The general plan on which most of the wet-clay machines work is as follows: The machine is driven by steam, and the clay is fed by a hopper into a pug-mill, on the central shaft of which strong pugging blades are placed in a spiral manner. These prepare and force the clay out at the bottom, whence it passes over the carrying rollers to the pressing rollers, which force it through a die in a rectangular stream, so exactly shaped to the required size that nothing more is necessary than to cut it into single bricks by wires. These are set in a rocking frame, which can be so adjusted as to cut the bricks on the square or at an angle; the one plan being adopted when the clay is at rest, the other while it is in motion. When double-ended, the clay is forced out at opposite sides of the pugging cylinder, and there is then, of course, a cutting-table at either side, instead of only one. Some of these machines are provided with a pair of powerful crushing rollers, which reduce any hard lumps or stones before the clay enters the pug-mill. One of the best known wet-clay machines is that made by Clayton, Son & Co., London. When of a size which can be worked by a steam engine of 16-horse power, it produces from 20,000 to 30,000 bricks per day, and its price in 1871 was £330. Drain tiles are made by the same kind of machinery, with a peculiarly constructed die, so as to make clay into a hollow tube; so also are hollow bricks, with again an alteration in the shape of the die. Hollow bricks, having less body than those which are solid, are more easily and usually more thoroughly fired. On account of this, as well as by reason of their admitting of a current of air through them, they form, as a rule, dryer walls.

The green bricks, after being carefully dried, either in the sun or by artificial heat, are usually baked in a kiln with a suitable arrangement of fires and flues. Kilns are of many forms, and the time required for firing in them varies from 40 to 60 hours for common red and white bricks, while for some fire-bricks 150 hours are necessary. Where kilns are not used, bricks are burned in clamps, the clay requiring to be mixed up, in the process of tempering, with a quantity of ground coal sufficient to burn them. A good test of the character of a clay is obtained by the result of firing. The average contraction in the kiln for prepared clays is $7\frac{1}{2}$ per cent. If a brick contracts much more than this, the clay is too fusible; if less, then it is likely to be of an open porous body, which retains its shape well during the firing process.

All brick clays contain iron, and the color of a burned brick almost entirely depends on the amount of it which is present; thus clays containing less than 1 or $1\frac{1}{2}$ per cent of iron, change in the kiln to various shades of cream color and buff, whilst those containing more than 2 per cent, range in color from yellowish-fawn to dark red. Blue bricks are made from the same clay as the red, by controlling in a peculiar way the supply of air in firing, and by carrying the heat slightly further. It is asserted by some that the red is changed to the black oxide of iron in the process.

Fire-bricks are made from clay as free as possible from oxide of iron and alkaline substances, so that there may be no tendency to fuse in the kiln, however high the heat. Fire-clays are abundant in the coal-measures, some of fine quality being found about Newcastle and Glasgow, but the most celebrated is that of Stourbridge, which is exported to all parts of the world. See FIRE-CLAY.

Much attention has been paid of late years to the manufacture of fine bricks and terra cotta, which is only another name for ornamental bricks of various shapes, or architectural enrichments of the same material. The effect of some of the public buildings recently erected in London and elsewhere, in which terra cotta has been used, is really beautiful. Although it cannot be said to equal sandstone in appearance, it has

yet the advantage of giving a much greater variety of color, and is infinitely better and more enduring than a facing of stucco or cement.

The duties formerly levied on bricks were wholly repealed in 1850.

BRICK (*ante*), made in the United States in nearly the same manner as in England. The size varies in various sections from $7\frac{1}{4}$ to $8\frac{1}{2}$ in. long, 4 to $4\frac{1}{2}$ wide, and 2 to $2\frac{1}{4}$ thick, and is therefore smaller than that of English B., which are usually 9 by $4\frac{1}{2}$ and $2\frac{1}{2}$. Philadelphia pressed bricks are in great demand for outer or front walls in consequence of their perfection. Immense quantities of B. are made at Haverstraw and other places on the Hudson river. Excellent fire-brick are made at South Amboy, N. J.; at Athens, on the Hudson; at Chicago, Peoria, and other places. Milwaukee bricks have a pleasing yellowish cream color; and these, with others variously colored in the manufacture, find much favor for outer walls. Bricks are found to stand fire better than stone.

BRICKLAYING—BRICKWORK. The material of which a town is built depends mainly on the geology of the surrounding district. In a mountainous country like Scotland, cities of stone, such as Edinburgh, Glasgow, and Aberdeen, naturally abound; while London and most of the great towns of England, situated in alluvial valleys and plains, are built of bricks derived from the alluvial clay beneath and around them. In Holland, where the whole country is but the delta of the Rhine, and no stone is to be found, brick is universal, even to the paving of the streets.

The standard size of English bricks being 9 in. by $4\frac{1}{2}$, the thickness of walls is regulated thereby. They are either half-brick, 1 brick, $1\frac{1}{2}$, 2, 3, or 4 bricks in thickness. In moderate-sized modern English houses, the inside partition-walls are usually half-brick, the outer walls, 1 or $1\frac{1}{2}$. In larger houses of superior construction, a thickness of two or three bricks is sometimes used. This latter thickness is seldom exceeded, except in large public works. Modern brick-houses are, for the most part, far less substantial than those erected by our forefathers. Building leases being usually granted for ninety-nine years, at the expiration of which term, the whole property reverts to the freeholder, the object of the builder is merely to make a house that shall stand for that period, and not to expend any money for the sake of further stability. Garden-walls are commonly built but half-brick in thickness; these, however, are strengthened by 9-in. piers at intervals of 10 or 12 feet. In laying the foundations of walls, the first courses should be thicker than the intended super-structure, and the projections thus formed, usually of quarter brick on each side, are called "set-offs." Before laying walls of houses, trenches are dug, and the foundation tried with a crowbar or rammer. If it is found to be loose, and the looseness due to superficial soil, this is removed, and its place supplied with fragments of stone and old broken bricks, which are closely rammed together. In some cases inverted arches of brick are built for foundation, or a stratum of concrete laid down. See CONCRETE.

Mortar composed of lime and sand is the common cement for brickwork. It should be equally and carefully applied; and the bricks wetted, in order that the mortar may adhere more firmly, by being absorbed into their pores. The force with which good mortar is capable of adhering to bricks is very remarkable. It is found to be the greatest in old structures that have been exposed to the continuous action of water. Such B. is said to be "water-bound" by workmen, and can scarcely be separated without breaking the bricks.

A fundamental principle to be rigidly observed in laying all kinds of brick is, that *no two contiguous perpendicular joints shall fall immediately below each other*, or, to use the bricklayer's phrase, the work must "break bond." The mode of arrangement of the bricks to effect this is called the *bond*; a layer or stratum of bricks is called a *course*. Bricks laid with their lengths in the direction of the course, and their sides to the wall-face, are called *stretchers*; those laid across the line of the course, with their ends forming the wall-face, *headers*; a layer of headers: a *heading course*, of stretchers, a *stretching course*.

The two kinds of bond almost exclusively used in England are the English and Flemish bond. English bond consists of alternate stretching and heading courses; Flemish bond, of a stretcher and header laid alternately in each course. English bond is the strongest; Flemish bond, the more ornamental; and they are used accordingly. There are two other kinds of bond occasionally used—*herring bond*, and *garden-wall bond*. The former is applied to form the core of thick walls, where Flemish bond is used for the facing. A course of bricks is laid obliquely at an angle of 45° to the face of the wall; then above it, another course at the same angle, but inclined in the opposite direction, so that the joints may cross the first. This is considered to add to the strength of Flemish bond, but is objectionable on account of the triangular interstices necessarily left between the oblique bricks and the bricks of the facing. Garden-wall bond is only used for 9-inch walls, and formed by laying three stretchers and one header, and so on in each course. In order to strengthen Flemish bond, bands of hoop-iron are sometimes laid flatwise between the courses. This "hoop-iron bond" has superseded the old practice of using bond-timbers, which were inserted the whole length of the wall. The hoop-iron should be slightly rusted, to secure the complete adhesion of the mortar.

In constructing arches of brick-work, much care and skill are required. A wooden

centering is always used; and when very rude work only is required, common bricks are laid upon the centering, and the gaping interstices at the upper ends filled with rough brick wedges. For better work, each brick has to be properly beveled, according to the curve. When semicircular arches are made, all the bricks require an equal bevel, and therefore bricks molded uniformly to the required angle may be used; but for other curves and for flat arches, each brick has to be separately shaped by the bricklayer. In order to do this, a drawing of the required arch is made of the full size on a board; the bricks are laid upon this side by side, and shaped to the lines of the drawing; they are then transferred to their corresponding place in the structure. The bricks are first rudely shaped by the *brick-axe*, then finished on the *rubbing-stone*, a piece of rough-grained stone about 20 in. in diameter. In all kinds of B., the walls should be built up level throughout, in order that the *settlement* may be equal. An unequal settlement may produce a rupture of the wall.

B. is measured by the rod or by thousand. A rod contains 272 sq.ft. of standard thickness—that is, $1\frac{1}{2}$ brick. This is equal to 306 cubic ft., and will, on an average, require 4500 bricks, allowing for waste. The weight of a rod of B. containing 4500 bricks, 27 bushels of lime, and 3 single loads of sand, is about 13 tons. The bricklayer is always attended by a laborer or hodman, who carries his bricks and mortar in a "hod"—a triangular wooden box, open at the top and one end, and supported on a round leg, by which the hodman holds it on his shoulder. A bricklayer's wages are considerable higher than those of the hodman. The laborers are generally Irishmen.

The surface of brick-work is sometimes ornamented by *pointing*. This is done by raking out the mortar of the joints to a small depth, and filling up again with blue mortar, and marking the courses with the edge of the trowel. This is called *flat-joint* pointing. When the courses are marked by a neatly pared raised line of white plaster of about half an inch in thickness, laid upon the blue mortar, it is called *tuck* or *tuck-joint* pointing. Colored bricks, as a means of external ornament, have been extensively and most effectively used in n. Italy and Germany. The works of Mr. Ruskin, Mr. Gally Knight, Webb's *Continental Ecclesiology*, Street's *Brick and Marble of the Middle Ages*, and Fergusson's *Hand-book of Architecture*, may be consulted for illustrated examples of these.

Chromatic brick-work is now becoming very extensively used in England, especially by architects who are endeavoring to revive the style of architecture called by themselves English Gothic, and by some others Venetian Gothic, in which the pointed arch, formed of colored bricks, forms one of the prominent features. These architects maintain that, as they are compelled to construct with B., it is more honest to use bricks ornamentally, than by means of stucco to obtain an external imitation of stone; and as B. admits of but little ornamentation in relief, they use variation of color, of which B. is peculiarly susceptible, and thus produce a sort of architectural mosaic. The eloquent and popular advocacy of these views by Mr. Ruskin, and the skill and enthusiasm with which many young and rising architects are carrying them out, seem likely to bring about a great development, almost amounting to a revolution in English domestic and ecclesiastical architecture.

BRICOLLE. See BALLISTA.

BRIDAINE, JACQUES, a French home-missionary preacher, 1701-67. Though a strict Roman Catholic in principle, he frequently advocated the cause of the Protestants with great boldness, and displayed personal kindness to many who were suffering persecution. He made more than 250 journeys in all parts of France, and became universally popular. His sermons and spiritual songs, or hymns, have been printed.

BRIDE—BRIDAL. The word bride (the radical signification of which is thought by some to be "appropriated," "owned") is common to all the Gothic languages, and also to Welsh (Ger. *braut*, Welsh *pruid*), and signifies betrothed or newly married. Alone, the word denotes the newly married woman; with the addition of the syllable *groom* (a corruption of *guma* = Lat. *homo*, a man), it denotes the newly married man (Ang. Sax. *brydguma*, Ger. *brutigam*). In Welsh, *pruid-fab* (betrothed youth) is bridegroom, and *pruid-ferch* (betrothed maid) is bride. Bride is the root of a variety of terms connected with marriage, as bride-favors, bride-cake, etc. Bridal is for *bride-ale* (Ang. Sax. *brydeale*), the marriage-feast. Bridemaids, or attendants on brides, appear to have been in use among the Anglo-Saxons, and are mentioned in early accounts of marriage ceremonies. A part of their duty consisted in dressing and undressing the bride. Bridemaids, as mere ceremonious attendants at marriages, are still in use in England. The husband had an analogous body of attendants, called bridegroom-men; but they have disappeared in modern usage, and their only representative is one confidential friend in attendance. In Scotland, this personage is called the best man. One of his duties is to pull off the bridegroom's right-hand glove, while one of the bridemaids does the same service for the bride, when the pair are requested to join hands.

BRIDE-FAVORS are small knots of white ribbons, which are pinned to the breasts of all who are in attendance at weddings, nor are even the postboys and their horses' heads left undecorated with these gay trappings. The origin of the bride-favor is said to be the true-lovers'-knot—something symbolical of the union of hearts and hands on the

occasion. In various old plays and poems there are allusions to bride-favors or ribbons, as that in Herrick's *Hesperides*:

What posies for our wedding-rings,
What gloves we'll give and ribbonings

The BRIDE-CAKE is also symbolical in its origin. "The ceremony used at the solemnization of marriage among the Romans was called *confarreatio*, in token of the most firm conjunction between the man and wife, with a cake of wheat or barley. This, Blount tells us, is still retained in part with us, by that which is called the bride-cake used at weddings."—Brand's *Popular Antiquities*. The old English and also Scottish custom of breaking a cake over the head of the bride on entering her new dwelling, perhaps points to a usage of the most remote antiquity—the sprinkling with wheat as a token of plenty. In modern times, the bride-cake is a state, y piece of confectionary, consisting of a rich cake as a basis, on which is reared a castellated structure, with various fanciful devices, the whole being covered with a preparation of white sugar. This fabric is cut up and given in pieces to the guests, as part of the wedding jovialty.

BRIDEWELL, a well between Fleet street and the Thames, dedicated to St. Bride, which has given its name to a palace, parish, and house of correction. A palace, described as "a stately and beautiful house," was built here, in 1522, by Henry VIII., for the reception and accommodation of the emperor Charles V. and his retinue; and king Henry himself also often lodged here, as, for instance, in 1525, when a parliament was held in Blackfriars; and in 1529, the same regal personage and his queen, Catharine, lived in the B. while the question of their marriage was argued. In 1553, Edward VI. gave it over to the city of London, to be used as a workhouse for the poor, and a house of correction "for the strumpet and idle person, for the rioter that consumeth all, and for the vagabond that will abide in no place." Queen Mary having confirmed the gift, it was formally taken possession of in 1555 by the lord mayor and corporation. The B. was afterwards used for other persons than the class above named, and at last became a place of punishment, as it now is. As a house of correction, it is not under the sheriff's charge, but is governed by a keeper wholly independent of that officer.

By the 15 and 16 Vict. c. 70 a new house of correction is established for the city of London. See CORRECTION, HOUSE OF.

BRIDGE (Ang.-Sax. *brycg*; Dutch, *brug*; Ger. *brücke*) is a structure for carrying a road over a stream, river, ravine, low ground, or other impediment to its course. A bridge for carrying a canal or other water-course, is called an aqueduct (q.v.); one for carrying a railway is sometimes called by the recently coined, though not very correct, word *viaduct* (q.v.). Bridges are formed of stone, brick, cast-iron, or timber arches; of timber beams or frame-work, supported on piles or on masonry; of iron rods or chains, in which case they are called suspension-bridges; of lattice-work; or of cast or wrought-iron girders. Sometimes a combination of beams and suspension-rods is used. Of late years, the plan of tubular or hollow wrought-iron girders has been frequently and successfully employed, the first great example being the Britannia bridge (q.v.).

Bridges are either fixed or movable. Of movable bridges there are various kinds. *Flying-bridges* and *floating-bridges* are, in fact, mere ferry-boats (see FERRY) with gaugeways attached, and other provisions for safe and ready transport, and which are drawn across the stream by ropes. *Draw-bridges* and *swing-bridges* are constructed in two parts, that turn on pivots—in the former, the parts are lifted vertically; in the other, they are moved round horizontally. A *sliding-bridge* runs backward and forward on wheels or rollers. Another kind is much in use in low districts like Norfolk, where the water flows lazily, and almost on the land-level. These are sometimes called pontoon-bridges, from the movable roadway being balanced at a small height above the water-level on a pivot working in a large pontoon or hollow cylinder sunk in the bed of the river—the ends of the roadway of the B. when laid across the river, resting freely on piers on either side. There are several such bridges in use over the Ouse. The pivot is set in the center of the stream, and, when necessary, the B. is turned round on it by machinery, till it lies parallel to the banks, and permits the passage of barges on either side. In a flat district, these bridges are exceedingly appropriate. See also BRIDGE, MILITARY.

Convenience must have led men in a very rude state of society to form bridges, in order to the easier communication between districts separated by rivers. On most streams there occur fords, but often these are not to be found where they would be most desirable. The most rudimentary form of a B. may be assumed to be a series of stepping-stones, such as are yet almost everywhere to be found on river-courses at some point. Large stones deposited in the streams at the shallows or fords, would first give a chance to a passenger of getting across dry shod; by and by, where one or two stones were wanting to complete the steps in the passage, they would be supplied. Next, it would naturally occur to give greater security to the passage, by laying planks or trees across the stepping-stones, so as to avoid the risks attending stepping or leaping from the one to the other. In the arrangement of planks resting thus on stones, we have the first advance in the art of bridge building, the suggestion at once both of piers and roadways; and beyond this stage, the art would appear not to have advanced for a very long period. From the Greeks, we have accounts of bridges built by Semiramis,

Darius, Xerxes, and Pyrrhus; and in Egypt, necessity early compelled the formation of bridges in connection with the canals constructed for the purpose of irrigation. But all these would appear to have been rudimentary in form, and to have consisted simply of piers, with the intervals between them spanned by beams of timber or large flat stones. Sometimes boats moored in the stream served the purpose of piers, as was the case with the famous B. of Xerxes across the Hellespont. Bridges of boats are in use to this day. The principle of the arch was long known before it was applied to the art of bridge-building. See ARCH. That application we owe to the Romans, whose first great work in which the arch was employed, the Cloaca Maxima (q.v.), is referable to the time of the Tarquins. The Ponto de Rotto, or Senators' B. (127 B.C.), erected by Caius Flavius, appears to have been the first instance of its application to bridges. In the course of the great engineering undertaking of the Roman empire under Augustus Cæsar for the formation of roads and supply of water to Rome, its application became general; and afterwards, the empire having extended its bounds, the necessity for ready communication between its provinces, led to the erection of numerous splendid bridges therein, many of which, indeed, surpassed in their greatness those of Rome itself. But although the Romans have unquestionably the merit of having originated the art of bridge-building proper in Europe, yet it seems doubtful whether the principle of the arch was not applied by eastern nations to bridge-building long before the dawn of the greatness of the Roman empire. The Chinese are said to have been before the west in this as in other arts, though the antiquity of some of the bridges on which this assertion is rested may well be doubted, considering the uncertainty which pervades the chronology of that extraordinary people.

It is impossible here to trace in detail the progress of the art. For a long time after the decay of the Roman empire, it made no progress. It revived in the 11th c., but again languished to the beginning of the 18th, when the formation of the corps of the Ponts et Chaussées in France favored its further growth. Henceforth, many splendid bridges were erected both in Britain and the continent. In 1775, Mr. Pritchard of Shrewsbury, introducing the use of cast iron in the erection of bridges, originated a valuable style of construction. The genius and works of Telford bring us to the present time. Within half a century, the use of steam, the development of the canal system, and the necessity especially for railway-bridges, with the immense amount of capital at the disposal of engineers for purposes of bridge-building, have caused a rapid evolution of all the principles and possible modes of the art. Among the new forms called forth within the century by the increasing demand for facilities of communication, are the suspension B., the wrought-iron girder and tubular bridges, and the lattice-bridges. Several of the new bridges over the Thames are models of engineering skill and taste. The Menai and Britannia bridges were regarded when erected as perfect marvels of the art, and yet they have since been surpassed. In America, the B. of Trenton, over the Delaware, the great Portage viaduct, and the Niagara suspension B., are equal to any similar works in the world. The Tay B., opened in May, 1878, is the longest (2 m. in length) and perhaps the greatest achievement of modern engineering skill. The variety of complex structures of wood and of iron that now span streams and hollows is endless. For some of the more important forms, see FRAME, LATTICE, TUBULAR, and SUSPENSION BRIDGES. What follows here, relates chiefly to arched or masonic bridges, and is confined to the more general and obvious conditions which such bridges must fulfill, avoiding the mechanical theory of their stability as too abstruse for popular exposition.

An arched B. rests between masses of masonry on opposite sides of a river, called its *abutments* (q.v.). The intermediate points of support of the arches are the piers (q.v.), which are rarely built so strong as to be able of themselves to resist the lateral thrust of the arches resting on them, if the thrust of one arch did not counteract that of another. The arch itself is the curved construction between adjacent piers. The chief terms used in speaking of the arch itself are explained under ARCH. In addition, may be noticed the *spandril*, the name given to the filling in above the extrados to the roadway. The *chord* or *span* is the distance between the piers; while the *rise* of the arch is the perpendicular distance between the level of the springing and the horizontal through the key.

When a B. has to be erected, the question of what form it should be, falls to be settled by a variety of considerations. Regard to appearance affects the question, but the material points are its sufficiency for the purposes for which it is intended, and its security and durability. The nature of the embankments and of the soil in the water-bed, together with the nature of the water-shed, or country drained by the stream, may make it necessary that the B. should not be an arched bridge at all, but a suspension or tubular bridge. But if it is to be an arched B., then the most important questions respect the number of its piers and the form of its arches. If vessels must be free to pass under it, the arches must be lofty, and the abutments high; so also must they be if the river is exposed to sudden elevations of its level by floods. Formerly, a prejudice existed against laying a B. across a stream at any other angle than at right angles to its course. The reason was, that, the theory of the skewed arch (q.v.) being unknown, the obliquity of the B. to the water-course involved a corresponding obliquity of its piers to the water, which greatly increased the risk of the B. suffering from floods. But the skewed arch allows a B. to be thrown at any angle across a river, with its piers all parallel to the

stream; and many an awkward turn in our public roads would have been spared us, had the skewed arch only been earlier known.

After making allowance for the requirements of position and traffic, the form next must be considered, more particularly in relation to the stream. The stream principally affects the form, through prescribing the number of piers. Each pier takes up so much of the water-course, and thus narrows the effective passage of the water. The immediate consequence of narrowing the channel is to increase the velocity of the stream. As the velocity of the stream increases, it tends more and more to carry off the soil in the neighborhood of the piers, and finally, by deepening its course, to undermine them. From this consideration, the effect of too many piers will be obvious; but indeed this is not matter of speculation, for many bridges—among others, a B. of Smeaton's at Hexham—have been destroyed from this cause, thus falling from the very overabundance of support! To know how many piers may with safety be used, the volume of water that flows through the channel, both ordinarily and in winter-floods, must be ascertained, which can be done very nearly by calculating the mean of many soundings taken at different states of the river, and at a succession of points across its bed. There is another way in which the stream affects the form. If it is liable to floods, care must be taken to make the piers so high as to elevate the spring of the arches above the highest level attainable by the water. In connection with this part of the subject, it must be remembered, too, that floods are apt to carry down trees and other floating masses, which, if the arches do not afford them passage, become powerful levers for the destruction of the bridge.

The form of the B. being determined on, the remaining questions relate to its stability. This depends on the strength of the abutments and piers, and the balanced equilibrium of the arches. The importance of securing proper foundations for the abutments and piers cannot be over-estimated, and very frequently their foundations, owing to the nature of the soil, have to be artificially constructed. See PILES, COFFER-DAM, and CONCRETE. In considering the stability of the B., the first thing is to ascertain the forces which will act to destroy it. This is ascertained by calculating the extreme passing load, and also the weight of the structure above the arches, and of the arches themselves. A scientific and skilled engineer is then able to judge what amount of strain or destructive pressure will be exercised by these weights on the several parts of the structure, and thus to adapt the strength at every point to the strain. As to the passing load, it is usual to calculate on 240 lbs. per foot, superficial, of the whole area in ordinary bridges, and on 960 lbs. in railway bridges. The weight of the superstructure and arches is a question for practical measurement. As to the remaining pressure—viz., that of the stream—it must be ascertained for the highest floods. It is calculated from knowing the mean velocity of the stream, and the amount of surface exposed to it. The surface is readily observed by means of floats; and when this is under 10 ft. per second, the mean velocity is found to be about one fifth less. The stress of the stream on the bridge is diminished by the expedient known as a cut-water, which is an angular projection from the pier. The best form for a cut-water has practically been ascertained to be an equilateral prism, presenting an angle of 60° to the water-course. In all bridges, these are to be found on the sides of the piers presented to the stream; and in tidal rivers, they are built on the lower side as well.

After the conditions already mentioned are satisfied, taste has more to do with the form of the arches than anything else. The forms in use are the old semicircular, the elliptical—usually got at by putting together several circular arches of different radii—and the segmental arch. The semicircular arch was almost exclusively used in the more ancient bridges. This arch is the most solid and most easily constructed, as all the voussoirs may be worked from the same mold. It requires, however, high banking, as its height is equal half its breadth; and where the water-level greatly changes, it is particularly unsuitable, from the great height necessary to be given to the piers, to carry the intrados out of water-reach. The elliptical arch and the segmental of 60° are, besides, far more pleasing in appearance.

In possible extent of span, the masonic bridge is far exceeded by suspension and girder bridges. At Chester there is a stone arch with a span of 200 ft.; in the Britannia tubular bridge the span is 460 ft.; in the suspension bridge over the Menai strait, 600 ft.; and in the suspension bridge at Freiburg, Switzerland, 870 feet. The railway bridge across the Tay, near Dundee, of iron girders is remarkable for its great length, 3450 yards. See TUBULAR BRIDGE and SUSPENSION BRIDGES.

The principal objection to the wooden B. is its liability to decay, besides which it is liable to warping, through the swelling and contracting of its beams. The latter objection applies also to iron bridges, but in their case, the contractions and expansions may be compensated for, as in the compensation balance of a watch, or the compensation pendulum.

Public bridges are maintainable at the expense of the counties in which they are situated; but in many cities and boroughs, the inhabitants have acquired by prescription a liability for this expense, and by the 13 and 14 Vict. c. 64, the management and control of such bridges is given to the council of the city or borough. If part of a public bridge be within one county or other place on which the liability rests, and the other part of the bridge be within another, each party or body shall repair that part of the bridge which

is within its own boundaries. Besides the bridge itself, the county liable is bound by the 22 Henry VIII. c. 5, to repair 300 ft. of the road either way from the bridge. And such is still the state of the law as to all bridges built prior to the passing of the highway act, 5 and 6 Will. IV. c. 50. But by that act it is provided that, in the case of all bridges thereafter to be built, the repair of the road itself passing over or adjoining to a bridge, shall be done by the parish, or other parties bound to the general repair of the highway of which it forms a portion—the county being still subject, however, to its former obligation as regards “the walls, banks, or fences of the raised causeways, and raised approaches to any bridge, or the land arches thereof.” See Stephen’s *Com.*, vol. iii. p. 234. The neglect to make such repairs is treated in law books as a kind of negative offense; but there are positive offenses against bridges, which in the statutes are called nuisances, as to which, see the 43 Geo. III. c. 59. An act to amend the law in regard to the maintenance and management of roads and bridges in Scotland was passed in 1878, entitled “Roads and Bridges act.” Private bridges are those erected and maintained under contracts authorized by private acts of parliament. See ROAD.

BRIDGE (*ante*). The most important American bridge now under construction is that over the East river between the cities of New York and Brooklyn, commonly known as the “Brooklyn bridge.” The land approaches are of stone and brick in arches and piers, terminating at the river in the grand stone piers that rise 278 ft. above high water. The following official account of dimensions and progress is down to the close of 1879: construction commenced Jan. 2, 1870; size of New York caisson, 172×102 ft.; size of Brooklyn caisson, 168×102 ft.; timber and iron in caisson, 5253 cubic yards; concrete in well-holes, chambers, etc., 5669 cubic ft.; weight of New York caisson, about 7000 tons; weight of concrete filling, about 8000 tons; New York tower contains 46,945 cubic yards of masonry; Brooklyn tower contains 38,214 cubic yards of masonry; length of river span 1595 ft. 6 in.; length of each land span, 930 ft.—1860 ft.; length of Brooklyn approach, 971 ft.; length of New York approach, 1562 ft., 6 in.; total length of bridge, 5989 ft., or 1.134 m.; width of bridge, 85 ft.; number of cables, 4; diameter of each cable, 15½ in.; first wire was run out May 20, 1877; cable-making really commenced June 11, 1877; length of each single wire in cables, 3578 ft. 6 in.; ultimate strength of each cable, 12,200 tons; weight of wire, 12 ft. per lb.; each cable contains 5296 parallel (not twisted) galvanized steel, oil-coated wires, closely wrapped to a solid cylinder 15½ in. in diameter; depth of Brooklyn tower foundation below high-water, 45 ft.; depth of New York tower foundation below high water, 78 ft.; size of towers at high-water line, 140×59 ft.; size of towers at roof course, 136×53 ft.; total height of towers above high-water, 278 ft.; clear height of bridge in center of river span above high-water, at 90° Fah., 135 ft.; height of floor at towers above high water, 119 ft. 3 in.; grade of roadway, 3¼ ft. in 100 ft.; height of towers above roadway, 159 ft.; size of anchorages at base, 129×119 ft.; size of anchorages at top, 117×104 ft.; height of anchorages, 88 ft. front and 85 ft. rear; weight of each anchor plate, 23 tons; total cost of bridge, exclusive of land, \$9,000,000. The bridge will probably be completed in 1882. Engineer, col. W. A. Roebling. The towers were finished long ago; so were the cables, and the construction of the floor, with the many rods suspending it, will finish the bridge proper.

Some other American bridges may be briefly described. One of the earliest of note is that over the Schuylkill at Philadelphia, which Fanny Kemble poetically described as “a scarf rounded by the wind and thrown over the river.” It was accidentally burned in 1838. The railroad bridge at Bellows Falls, built in 1850, has a span of 250 feet. The Susquehanna bridge (of the Wilmington and Baltimore railroad) is 3500 ft. long, with 13 piers and 2 guard piers at the draw. The spans are 250 ft. long, and the draw-span 176 feet. The Niagara Suspension bridge has a span from center to center of towers of 821 ft., and is 245 ft. above the river. The bridge (suspension) over the Ohio between Cincinnati and Covington has a span of 1067 ft. and is 91 ft. above low-water. The Clifton bridge (over Niagara river just below the falls and above the suspension bridge) is 1190 ft. from bank to bank, and 1268 ft. between the points of suspension on the towers, and is 193 ft. above the water. The Victoria tubular bridge over the St. Lawrence at Montreal has a length of tube of 6600 ft., carried over 25 openings of 240 ft. each, and one of 330 ft.; with the approaches this bridge is 9084 ft. long. The Quincy bridge over the Mississippi (draw) has 17 spans, two of 250 ft., three of 200, 11 of 137, and a draw-span of 360 feet. The bridge over the Missouri at Omaha is 2800 ft. long in 11 spans. The bridge of the New York Central railroad over the Hudson at Albany is 1740 ft. long, in 15 spans and a draw. But the most noteworthy of railroad bridges is that over the Mississippi at St. Louis. It is in three immense spans, those at the end being 497 ft. each, and the middle one 515 feet. Over the railroad floor is a carriage and foot roadway 34 ft. wide between the foot-walks which are each 8 ft. wide.

The terrible disaster of the fall of the Tay bridge in Scotland, the center portion of which went down in a furious gale on the night of the 27th Dec., 1879, justifies a brief description of that structure. It was the largest iron bridge in the world, crossing the river, or arm of the sea, a mile and a quarter w. of Dundee, with a length from shore to shore of 10,320 ft. (only 240 ft. less than two miles). Commencing at the s. or Fife shore there were three spans of 60 ft., two of 80 ft., 22 of 120 ft., 14 of 200 ft., 16 of 120 ft., 25 of 66 ft., one of 160 ft., and six of 27 ft.; in all 89 spans, the rails being 88 ft.

above the water. The portion which fell consisted of 12 spans somewhere near the middle of the bridge. A train of six passenger cars and the brakemen's van either went down with the bridge or ran into the vacancy in the dark, and not one person survived. There were over 90 lives lost.

The following statement comprises a list of the most important railway bridges and viaducts constructed by European and American railway companies. There are stone, wood, and iron structures, all of which appear under a separate head:

Stone Bridges and Viaducts.—Ballochmoyle viaduct, Glasgow, and S. W., width of span, 181 ft.; viaduct at Nogent, S. M., near Paris, 164 ft.; Durham Junction viaduct, 160 ft.; bridge near Wolmsdorf, Silesia, 150 ft.; bridge near Maidenhead, built by Brunel, 1835, 129 feet. There are three or four structures to be added to the foregoing, whose widths of openings exceed 100 feet. This includes the bridge at the Point-du-Jour, at Paris; the viaduct near Loebau, in Saxony, and the bridge at Point-de-Pille, on the line between Orleans and Bordeaux. The highest arches are principally found in Germany, and in the second line in various parts of France.

Viaducts of Stone and Brick.—Height of arch; over the Goeltz valley, in Saxony, 256 ft.; over the Elster valley, in Saxony, 223 ft.; over the Riofredo, in Austria, 197 ft.; at Diedlenmuhle, near Chemnitz, Saxony, 170 ft.; at Chaumont, Paris to Mulhouse, 164 ft.; at Kalte Rinne, Semmering, Austria, 151 ft.; at Fure, near Grenoble, 135 ft.; at Comelle, near Creil, Paris, 131 ft.; at Wagnergraben, Semmering, Austria, 128 ft.; at Combe-Bouchard, Paris-Lyons railway, 128 feet. In addition to these there are several other bridges and viaducts whose height varies from 100 to 125 feet. Among the principal are: the viaduct over the Tranz valley, in Austria; bridge across the river Fulda, near Kragenhof, Hanover; the Goel viaduct at Aix-la-Chapelle; viaduct at Mireville, on the line between Havre and Rouen; four more are in Saxon Switzerland; the rest in various parts of France. The longest viaducts and bridges are to be found in England; notably the viaduct on the line from London to Greenwich; the system of the South-western, South-eastern, Chatham and Dover, Great Eastern, and of other lines serving the metropolis. The next importance attaches to the bridge spanning the Lagoons and running into Venice, the bridge and viaduct over the river Elbe, at Dresden, and a few others.

Timber-built Bridges and Viaducts.—The most prominent structures are the following: Over the river Mista, on the Moscow and St. Petersburg railway, nine openings, each 200 ft. wide; over the river Elbe, at Wittenberg, with 14 openings, varying in width from 140 to 100 ft.; bridge near Woltenhofen, on the road from Lindau to Augsburg, Bavaria, one opening, 170 ft. wide; bridge near Kempten, on the same line as the foregoing, with five openings, varying in width from 85 to 140 ft. each. There are two wooden bridges on the North Shields, Newcastle line, one with seven, the other with five openings, the widest of which spans about 135 feet. The United States possess wooden bridges in very large numbers, and of much greater dimensions than are found on European roads. Among those noteworthy is the bridge over the Delaware river, on the Erie road, with two openings, each of a width of about 260 feet. The next structure of importance is a bridge over the Susquehanna river, near Columbia, with 29 openings, each about 200 ft. wide. There are two bridges crossing the Connecticut river, with spans of 174 feet. These are the most prominent bridges; but there are numerous other very remarkable structures, which, though of smaller dimensions, give evidence of great engineering skill.

Iron Bridges and Viaducts.—The following list comprises structures of this class of the greatest extent in length:

	Feet.
Parkersburg bridge, West Virginia, U. S.	7,045
St. Charles bridge, Missouri, U. S.	6,536
Over the river Ohio, near Louisville, Ky., U. S.	5,310
Over the river Delaware, Pennsylvania, U. S.	4,920
Over the East river, New York.	5,000
Victoria bridge, St. Lawrence river, Canada.	4,980
Over the river Rhine, at Mayence, Germany.	3,380
Over the river Tongabudda, Bombay, Madras.	3,730
Over the river Mississippi, near Quincy, U. S. ...	3,200
Over the river Missouri, near Omaha, U. S.	2,790
Over the river Vistula, near Dirschau, Germany.	2,750
Over the river Danube, near Stadlau, Austria.	2,520
Over the river Po, near Mezzano-Corti, Italy.	2,485
Over the river Tamar, near Saltash.	2,190
Over the river Lek, near Kuilenburg.	2,185
Over the river Mississippi, near Dubuque, U. S.	1,758
Over the river Sorai, in British India.	1,745

The foregoing comprises a list of the longest bridges constructed of iron, but it does not include all the most important works from an engineering point of view. The bridges which have the widest or the most numerous openings are given in the subjoined list, and comprise all the great marvels which engineering skill and ingenuity have produced: Britannia bridge, Menai straits: four openings, each 460 ft., and two openings,

each 230 feet; built by Robert Stephenson and Fairbank, 1846-50. Conway bridge, Menai straits: one opening, 400 feet; built by Stephenson, 1847-48. Victoria bridge, crossing the St. Lawrence river at Montreal: one opening 330 ft., and 24 openings, each 240 feet; built by Stephenson. Bridge over the Garonne near Langon, on the Bordeaux-Cette line: one opening of 245 ft., and two each of 210 feet. Over the Aire, near Brotherton: one opening of 225 feet. Over the Trent, near Gainsborough, on the Manchester, Sheffield and Lincoln line: two openings, each 150 ft. wide. Over the river Lek, a branch of the Rhine, near Kuilenburg, Holland: one opening of 150 ft., one of 80 ft., and seven of 57 feet; built 1868-70. Over the river Ohio, near Louisville, U. S.; one opening of 400 ft.; one of 370 ft.; six, each of 236 ft.; 14, varying in width from 210 ft. to 140 ft.; one of 100 ft., and two, each of 50 feet; built in 1868. Over the Vistula, near Dirschau, Berlin-Königsberg line—built 1850-57, by Lentze: six openings, 350 ft. each. Over the Waal, near Lommel, Belgium: three openings of 400 ft. each, and eight of 190 ft. each. Over the Rhine, near Griethausen: one opening of 330 ft., and 20 of 60 ft. each; built in 1863-64, by Monie. Over the Rhine, near Hamm: four openings, each of 330 feet; built in 1868-70, by Pichier. Over the Dieppe, near Moerdyk, Holland: 14 openings, each of 330 ft., and two of 51 feet. This structure resembles in a measure the unfortunate Tay bridge. It was completed in 1871. Over the Rhine, near Cologne: four openings of 320 ft. each; built, 1856-60, by Lohse and Wiedman. Over the Nogat, near Marienburg, Baltic: two openings of 312 ft. each. Over the Wye, near Chepstow: one opening of 300 ft., and three, each of 100 feet; built by Brunel, 1850-52. Over the Rhine, near Mannheim: three openings of 295 feet. Over the Boyne, near Drogheda: one opening of 270 ft., and two each of 140 feet; built by Barton, 1855. Over the Danube canal, near Vienna: one opening 260 ft. wide; built in 1860 by Koestlin. Over the Danube, near Stadlau, Austria: five openings each of 250 ft., and 10 each of 110 feet; built by Ruppert, 1868-70. Over the Trent, near Newark: one opening of 240 feet; built by Fox and Henderson, 1851. Over the Thames, Blackfriars: one opening of 205 ft., two of 195 ft., and two of 170 feet; built 1863-64. Over the Kinzig, near Offenbourg, Germany: one opening of 190 feet. Over the Eipel, Hungary: one opening of 185 ft., and three of 145 feet. Over the Rhine, near Strasburg: three openings of 185 feet. Over the Grau, in Hungary: one opening of 166 ft., and three of 144 ft. each, built by Ruppert, 1858. Over the Saar, near Freiburg: five openings, each of 160 ft., and two of 142 feet. Crumlin Viaduct, Newport-Abergavenny line: 10 openings, each of 160 ft. width; built by Liddle and Gordon, 1853. Over the Lahn, near Coblenz: one opening, 150 ft. wide. Over the Thames, near Windsor: one opening of 200 feet; built by Brunel, 1849. Over the Weser, near Corvey, Germany: four openings, each of 185 feet; built by Schwedler, 1863-64. Over the Orne, near Caen, France: one opening of 145 feet. Built by Maier, 1858. On the Blackwall line: one opening, 120 feet. Over the Tamar, at Saltash: two openings of 450 ft., and 17 openings varying from 70 to 90 feet; built by Brunel. Over the Rhine, at Mayence; four openings, each of 335 ft., six of 115 ft., and 22 openings varying in width from 50 to 80 feet. Over the Isar, near Hesselohé, Germany: two openings, each of 170 ft., and two each of 85 feet. Over the Elbe, at Hamburg: seven openings, each of 335 ft., and three openings of 310 feet; built by Lohse, 1870. Over the Yssel, near Zutphen, Holland: one opening of 320 ft., and two of 55 feet. Over the Ohio, near Benwood, United States: one opening of 320 feet. Over the Mersey, near Runcorn, London and North-western railway: three openings of 300 ft. each. Over the Missouri, near Omaha, United States: 11 openings, each of 270 feet; built by Dodge, 1860-61. Over the Danube, near Manthausen, Austria: five openings of 260 ft., and two of 90 feet. Over the Danube, at Vienna, North-western line: four openings of 260 ft., and 14 openings of 95 feet; built by Hellweg and Gerlish, 1870-72.

The railway suspension bridge over the Forth at Queensferry will be, when completed, the most remarkable application of the suspension principle in the world. The breadth of the Forth at Queensferry is rather more than a mile; but, as the viaduct is to be continued overland on the n. shore for several hundred yards, the whole length of the bridge will be about one mile and one third. This, however, gives no fair idea of the breadth of span to which the physical conditions require the suspension principle to be applied. In the midst of the firth, but rather nearer to the northern than to the southern shore, rises the rocky islet of Inchgarvie. On either side of this island the bed of the river sinks to a depth which is impracticable for engineering purposes. On the n. side the bed sinks to a depth of 210 ft., on the s. side to 180 ft., below the water-mark; and it is there, for a breadth of 1600 ft. on either side, that no practicable bottom can be found for piers, and therefore that the suspension principle has perforce to be resorted to. Between the deep furrow on the s. side of Inchgarvie and the southern shore there is a reach of comparatively shallow water, with a maximum depth of 30 ft., but within which foundations may be found for some 12 or 15 piers. Viewed in profile from the bosom of the firth, the bridge will thus present to view five distinct sections. First, there is a shallow-water section on the s. side, covering some 2000 ft., and supported on 16 piers; then there is the deep-water section, s. of Inchgarvie, traversed by a suspension bridge; next there is the island of Inchgarvie itself, over which the viaduct will be carried on two or three piers; then there is the deep-water section n. of Inchgarvie, spanned by a second suspension bridge; and, lastly, there is the northern shoreward section, which carries the

viaduct on 10 or 11 piers from the brink of the tide to the dead level of the Fife shore. The great features of the architectural design, as seen from the firth, will be the four pairs of lofty towers on which the massive steel chains which are to support the two suspension bridges will be hung, and the two pairs of landward buttresses to which the suspending chains will be anchored. Of the towers, two pairs will rise from the island of Inchgarvie, and will reach the imposing height of 596 ft. Two pairs on the shore of n. Queensferry, and other two on the brink of deep water on the southern channel, will attain to a height of 584 feet. The two pairs of buttresses on the n. and the s. side respectively will be, of course, less lofty; but they will be bold and striking masses of masonry. Those parts of the bridge, n. and s., which rest on piers, with a solid foundation, will consist of a single permanent way 25 ft. broad, and carrying a double set of rails. But the intervening portions carried by the suspension bridges will consist of two distinct and parallel branches, each 15 ft. broad, each carrying a single line of rails, and 100 ft. apart. These branches will be tightly braced together; and this arrangement has been adopted in order to give greater breadth, and therefore greater stability, to the whole structure. Seen from above, the outline of the design has the appearance of a shuttle with elongated points. The divergence of the branches begins at the massive piers, two on each side, to which the suspension chains will be anchored, and the maximum of divergence, 100 ft., will be attained before the lofty towers are reached. While the bridge throughout the greater part of its extent makes necessarily a straight course, the shoreward part at either end forms a gentle curve. From each shore to the beginning of the suspension bridge the line rises with a gradient of 1 in 100. In the shoreward sections, and in that over Inchgarvie, the permanent way rests on the upper members of the lattice-girders; but in the two suspension sections it rests on the lower members. By this contrivance here, as in the case of the Tay bridge, the full height of 150 ft. above the high-water mark is confined to the central sections only. It will be evident that each of the deep-water channels n. and s. of the island of Inchgarvie will be spanned by a double suspension bridge. Each of these double bridges will consist of four parallel and enormous lattice-girders—two for each branch. These girders will be 1600 ft. long. Seen in profile, their upper members will form an arched outline, with a maximum height of 50 ft. and a minimum of 19 ft. besides the towers. On these towers, of course, their ends will rest; but they will derive their main support from four immense steel chains, one for each girder, which will be slung over the towers and fastened to the anchoring piers at either end. The girders will be attached to the chains by stout wrought-iron rods at intervals of 50 feet. It is expected that this wonderful bridge will be completed by Jan. 1, 1885.

BRIDGE, MILITARY, is a temporary construction, to facilitate the passage of rivers by troops, cannon, and military wagons. The most efficient are described under **PONTON**; but there are many other kinds. A *bridge of boats* is formed by small-craft, especially cargo-boats, collected from various places up and down the river; trestles are placed in them to bring their tops to one common level; the boats are anchored across the river, and baulks of timber, resting on the trestles, form a continuous road from boat to boat across the whole breadth of the river; the boats ought to be of such size that, when fully laden, the gunwales or upper edges shall not be less than one foot above the water. *Rope-bridges* are sometimes but not frequently used by military engineers. A *boat-and-rope bridge* consists of cables resting on boats, and supporting a platform or road of stout timber. A *cask-bridge* consists of a series of timber-rafts resting on casks; the casks are grouped together in quadrangular masses; at certain intervals, timbers are laid upon them to form rafts, and several such rafts form a bridge; it is an inferior kind of pontoon-bridge. A *trestle-bridge* is sometimes made for crossing a small stream in a hilly country; it consists of trestles hastily made up in any rough materials that may be at hand, with planking or fascines to form a flooring, cables to keep the trestles in a straight line, and heavy stones to prevent them from floating. *Raft-bridges*, consisting of planks lashed together, are easily made of any rough materials that may be found on the spot; but they have little buoyancy, and are not very manageable. A *swing-flying bridge* consists of a bridge of boats, of which one end is moored in the center of the river, and the other end left loose; this loose end is brought to the proper side of the river, the boats are laden, and they make a semicircular sweep across the river by means of rudders and oars, until the loose end of the bridge reaches the other bank. A *trail-flying bridge* is a boat or raft, or a string of boats or rafts, which is drawn across a river by ropes, in a line marked out and limited by other ropes.

BRIDGE, NATURAL. See **NATURAL BRIDGE**.

BRIDGE-BUILDING BROTHERHOODS (Fr. *Frères pontifes*; Lat. *Fratres pontifices*) were religious societies that originated in the s. of France in the latter half of the 12th century. Their purpose was to establish hospices at the most frequented fords of large rivers, to keep up ferries, and to build bridges. The church during the middle ages regarded the making of streets and bridges as meritorious religious service. Whether or not the herdsman Benezet, subsequently canonized, was the founder or only a member of this fraternity, is as uncertain as the tradition which attributes to him the completion of the bridge over the Rhone at Avignon in 1180. The fraternity was sanctioned by pope Clemens III. in 1189; its internal organization was similar to that of the knightly

orders, and the members wore as their badge or insignia a pick-hammer on the breast. In France, they labored very actively, but were gradually absorbed into the order of St. John. Similar associations sprang up in other lands, but under different names.

BRIDGE-HEAD, or **TÊTE-DU-PONT**, in military engineering, is a fortified post intended to defend the passage of a river over a bridge. It is a field-work, open at the gorge or in the rear, and having its two flanks on the banks of the river. The most favorable position is at a re-entering sinuosity of the river, where the guns can work better with the supporting batteries-opposite. Bridge-heads are usually temporary works, hastily constructed. Their most frequent use is to aid a retiring army to cross the river in good order, and to check an enemy pressing upon it. Openings are left to allow the retiring army, with guns and carriages, to file through without confusion; and parapets are so disposed as to flank and defend these openings.

BRIDGEMAN, LAURA. This famous blind mute was b. in Hanover, N. H., United States, on the 21st Dec., 1829. She was a bright, intelligent child, but at two years of age was seized with a violent fever, which utterly destroyed both sight and hearing. For a time this so shattered her system, that there seemed no hope of recovery; but she rallied, and soon learned to find her way about the house and neighborhood, and even learned to sew and to knit a little. A strong passion for imitation began to develop itself, and by assiduously cultivating this power, she was at last enabled to emerge out of her life of unbroken darkness and silence, and take her place among the educated people of the day. In 1839, Dr. Howe of Boston undertook her care and education at the deaf and dumb school. The first attempt was to give her a knowledge of arbitrary signs, by which she could interchange thoughts with others. Then she learned to read embossed letters by the touch; next, embossed words were attached to different articles, and she learned to associate each word with its corresponding object. A pat on the head told her when she was right in her spelling-lesson. Thus far, however, the work was only an exercise of imitation and memory, roused into exertion by the motive of love of approbation, but seemingly without intellectual perception of the relation between words and things. It was like teaching a clever dog a variety of tricks. But at last the truth flashed upon her, that by this means she could communicate to others a sign of what was passing in her own mind. Her whole being seemed changed. The next step was to procure a set of metal types, with the letters cast at the ends, and a board with square holes for their insertion, so as to be read by the finger. In six months, she could write down the name of most common objects, and in two years had made great bodily and mental improvement. She grew happier, and enjoyed play like other children, amusing herself with imaginary dialogues, spelling old and new words, and with her left hand slapping the fingers of her right, if they spelled a word wrong; or giving herself a pat of approval, as the teacher did, when correct. Her touch grew in accuracy as its power increased; she learned to know people almost instantly by the touch alone. In a year or two more, she was able to receive lessons in geography, algebra, and history. She received and answered letters from all parts of the world, and was always employed, and therefore always happy. Her brain seems to have been unduly excited for a blind person; she not only held imaginary dialogues with herself, but dreamed incessantly by night; and during these dreams, while asleep, talked much on her fingers. She learned to write a fair, legible, square hand, and to read with great dexterity, and at last, even to think deeply, and to reason with good sense and discrimination. Keen, sensitive, and lively, in various occupation, her days now pass rapidly and pleasantly, mainly owing to the unremitting skill and kindness of Dr. Howe. She was saved by him from a life of hopeless, helpless darkness; educated and trained to take her part in the world; and now, as a teacher of the blind and deaf and dumb, is conferring on them the blessings she has herself received. She is probably among the most skillful of blind teachers.

BRIDGENORTH, a t. of Salop or Shropshire, on both sides of the Severn, 20 m. s.e. of Shrewsbury. It consists of an upper and lower town, connected by a bridge over the Severn. The larger part of the town is on the right bank, and is built on a sandstone rock rising 60 ft. above the river. Pop. '71, 7317. It returns one member to parliament. The navigation of the Severn formerly employed many of the inhabitants, but the traffic has been greatly injured by the introduction of railways. The town, which was at one time called *Bruges* or *Brug*, is said to be of Saxon origin. In the beginning of the 12th c., the earl of Shrewsbury defended the town unsuccessfully against Henry I. It was besieged in the same century by Henry II.; and during the civil wars it resisted the parliamentary forces for three weeks. A great portion of the town was on this occasion destroyed by fire. It has carpet and worsted manufactories. Bishop Percy was born here.

BRIDGE OF ALLAN. See **ALLAN**.

BRIDGE OF SIGHS, the covered passage which connects the doge's palace in Venice with the prison, over which prisoners of state were taken to confinement or to execution.

BRIDGEPORT, a seaport of Connecticut, U. S., at the mouth of the Pequannock, which empties itself into an inlet of Long Island sound. It is in lat. 41° 11' n., and

long. 73° 12' w., being 178 m. to the s.w. of Boston, and 58 to the n.e. of New York. Pop. '70, 19,835, having gained 6536 in 10 years. B. is connected by railways both with the interior and with the other places generally on the seaboard. Though the harbor does not admit large ships, having only 13 ft. on the bar at high-water, yet B. has a considerable coasting-trade, and a number of vessels engaged in the whale-fishery. Its manufactures are extensive, particularly of carriages, harness, fire-arms, and sewing-machines.

BRIDGEPORT (*ante*), a city in Fairfield co., Conn., on Long Island sound, and on the New York and New Haven railroad, at its junction with the Housatonic railroad, 56 m. n.e. of New York. The harbor at the entrance of Pequannock creek is large and safe, and is the center of a considerable coastwise trade. The most elegant portion of the city is Golden hill, an elevation of about 100 ft., commanding delightful views of sound and shore, and covered with fine residences, many of which are owned and occupied by New Yorkers. All of the city is modern and well built, the streets shaded by trees, and the residences are well provided with water and gas. The earliest settlement, then called Newfield, was in 1639; the city charter is dated 1836. In 1850, the population was 6080; now it is about 23,000. There are many superior schools, and some fine churches. The chief business, besides the water trade, is in manufacturing, and in this the making of sewing-machines takes the lead, there being three large establishments. Here is also the largest manufactory of metallic cartridges in the country; and there are carriage factories, iron foundries, harness, and other business.

BRIDGER'S PASS, a defile in the Rocky mountains, in s. Wyoming, through which the overland stages went before the opening of the Pacific railroad. It is several miles long, and in most places has perpendicular side walls from 1000 to 2500 ft. high.

BRIDGET, SAINT (or, more properly, *Birgit* or *Brigitte*), a famous Roman Catholic saint, was b. in Sweden about the year 1302. Her father was a prince of the blood-royal of Sweden. When only sixteen, she married Ulf Gudmarson, prince of Nericia, a stripling of eighteen, by whom she had eight children, the youngest of whom, named Catherine, born in 1336, died in 1381, became *par excellence* the female saint of Sweden. Her husband and she now solemnly vowed to spend the remainder of their lives in a state of continence, and, to obtain strength to carry out their severe resolution, made a pilgrimage to the shrine of St. Jago de Compostella in Spain. On their return, Ulf died in 1344, and B. founded about the same time the monastery of Wadstena, in East Gothland. Sixty nuns and twenty-five monks were its first inmates. They received the rule of St. Augustine, to which St. B. herself added a few particulars. They constituted a new order, sometimes called the order of St. B., sometimes the order of St. Salvator, or the Holy Savior, which flourished in Sweden until the reformation, when it was suppressed, but it still possesses some establishments in Italy, Portugal, and elsewhere. Subsequently, St. B. went to Rome, where she founded a hospice for pilgrims and Swedish students, which was reorganized by Leo X. After having made a pilgrimage to Palestine, she died at Rome on her return, 23d July, 1373. Her bones were carried to Wadstena, and she herself was canonized in 1391 by pope Boniface IX. Her festival is on the 8th of October. The *Revelationes St. Brigittæ*, written by her confessors, was keenly attacked by the celebrated Gerson, but obtained the approval of the council of Basel, and has passed through many editions. Besides the *Revelationes*, there have been attributed to this saint a sermon on the Virgin, and five discourses on the passion of Jesus Christ, preceded by an introduction which was condemned by the congregation of the *Index*.

Not to be confounded with this Swedish saint is another St. Bridget, or St. Bride, as she is more commonly called, a native of Ireland, who flourished in the end of the 5th and beginning of the 6th c., and was renowned for her beauty. To escape the temptations to which this dangerous gift exposed her, as well as the offers of marriage with which she was annoyed, she prayed God to make her ugly. Her prayer was granted; and she retired from the world, founded the monastery of Kildare, and devoted herself to the education of young girls. Her day falls on the 1st of February. She was regarded as one of the three great saints of Ireland, the others being St. Patrick and St. Columba. She was held in great reverence in Scotland, and was regarded by the Douglasses as their tutelary saint.

BRIDGETON, a port of entry in New Jersey, U. S., about 40 m. s. of Philadelphia. It occupies both banks of the Cohansey creek, about 20 m. above its entrance into Delaware bay, its two divisions being connected by a wooden draw-bridge. The town contains a public library, two newspaper-offices, an iron foundry, a rolling-mill, a nail-factory, a woolen-factory, and a glass-work. It likewise owns upwards of 15,000 tons of shipping. Pop. in 1870, 6820.

BRIDGETON (*ante*), the capital of Cumberland co., N. J., on the Cohansey river, 20 m. from Delaware bay, 36 m. s. of Philadelphia, at the terminus of the West Jersey and the junction of the New Jersey Southern railroads; pop. '80, 8729. It is a port of entry, the second in importance in the state. Its chief manufactures are glass, water and gas pipes, nails, castings, machinery, lumber, brick, ship-building, woolens, and canned fruits, in which nearly 200 firms are engaged. Among its educational advan-

tages are the South Jersey institute, the West Jersey academy, and several superior select schools. There are a good public library, more than a dozen churches, and several benevolent societies, one of which is for the care of destitute children. There are water and gas works, and three bridges over the river, the town being built on both banks. The climate is excellent, and the surrounding region is exceedingly fertile and well cultivated.

BRIDGETOWN, the capital of Barbadoes (q.v.), is situated on the w. coast of the island along the n. side of Carlisle bay, which forms its roadstead, in lat. 13° 4' n., and long. 59° 37' w. Pop. 21,384. It was founded about the middle of the 17th c., taking the name Indian Bridge, and later its present appellation, from a rude aboriginal structure which spanned a neighboring creek. The present city, however, is only 100 years old, the former having been almost destroyed by fire in May, 1766. In 1831, a part of B. was destroyed by a hurricane, and in 1845 it again suffered severely from fire. It is the residence of the bishop of Barbadoes and of the governor-general of the Windward islands. Except Broad street, the thoroughfares are irregular, and the shops or general stores, having no windows in front, look heavy and unattractive. There is a considerable trade.

BRIDGEWATER, a township in Plymouth co., Mass., 27 m. n.e. of Boston, on the Fall river and Bridgewater Branch railroads. It contains the state normal school, the state almshouse, and various-manufactories. Pop. '80, 3,536.

BRIDGEWATER, a t. and port of Somersetshire, on both sides of the Parret (which is here spanned by an iron bridge), 6 m. in a direct line, and 12 by the river, from the Bristol channel, and 30 m. s.w. of Bristol. It stands on the border of a marshy plain, which lies between the Mendip and Quantock hills, but the country around is well wooded. It is chiefly built of brick. St. Mary's church has a remarkably slender and lofty spire. The Parret admits vessels of 200 tons up to the town; it rises 36 ft. at spring-tides, and is subject to a bore or perpendicular advancing wave, 6 or 8 ft. high, often causing much annoyance to shipping. Pop. in '71, 12,101. B. formerly returned two members to parliament, but was disfranchised in 1870. Bath or scouring bricks, peculiar to B. are made here of a mixture of sand and clay found in the river. Admiral Blake was a native of this town, which suffered severely in the civil wars, when it was besieged by Fairfax, and ultimately forced to surrender, the castle being dismantled by the conqueror. The unfortunate duke of Monmouth was proclaimed king by the corporation of B., before the battle of Sedgemoor, which occurred in 1685, 5 m. s.e. of B., and in which he was defeated by the royal army. In 1874, 154 vessels, of 10,140 tons, belonged to the port; and in the same year the number of vessels that cleared the port was 4,686, with an aggregate burden of 240,437 tons.

BRIDGEWATER, FRANCIS EGERTON, Duke of, styled the "Father of British Inland Navigation," youngest son of Seroop, fourth earl and first duke of B.; was b. in 1736, and succeeded his elder brother, second duke, in 1748. In 1758-60, he obtained acts of parliament for making a navigable canal from Worsley to Salford, Lancashire, and carrying it over the Mersey and Irwell Navigation at Barton by an aqueduct 39 ft. above the surface of the water, and 200 yds. long, thus forming a communication between his coal mines at Worsley and Manchester, on one level. In this great undertaking he was aided by the skill of James Brindley (q.v.), the celebrated engineer, and expended large sums of money. He was also a liberal promoter of the Grand Trunk Navigation; and the impulse he thus gave to the internal navigation of England, led to the extension of the canal system throughout the kingdom. In politics, though he took no active part, B. was a friend of the Pitt administration, and a contributor to the loyalty loan of no less than £100,000. He died unmarried, Mar. 8, 1803, and with his death the dukedom became extinct. Before he began to realize profits from his great work, B. lived in privacy, and restricted himself to the simplest fare; and after his death his great wealth was distributed among collateral branches of his family. A monument was erected to his memory in Manchester.

BRIDGEWATER, FRANCIS HENRY EGERTON, Earl of, son of John Egerton, bishop of Durham, grandnephew of the first duke of B., succeeded his brother as eighth earl, Oct. 21, 1823. Educated for the church, he had previously been prebendary of Durham. He died unmarried, in Feb., 1829, and the title became extinct. By his last will, dated Feb. 25, 1825, he left £8,000, invested in the public funds, to be paid to the author of the best treatise *On the Power, Wisdom, and Goodness of God, as manifested in the Creation*, illustrating such work by such arguments as the variety and formation of God's creatures in the animal, vegetable, and mineral kingdoms, the effect of digestion, the construction of the hand of man, and by discoveries, ancient and modern, in arts, sciences, and the whole extent of literature. The then president of the royal society of London, Davies Gilbert, to whom the selection of the author was left, with the advice of the archbishop of Canterbury, the bishop of London, and a noble friend of the deceased earl, judiciously resolved that, instead of being given to one man for one work, the money should be allotted to eight different persons for eight separate treatises, though all connected with the same primary theme (see next article). B. also left upwards of £12,000 to the British Museum, the interest to be employed in the purchase and care of MSS. for the public use.

BRIDGEWATER TREATISES, eight celebrated works "On the Power, Wisdom, and Goodness of God," by eight of the most eminent authors in their respective departments, published under a bequest of the last earl of B. (q.v.), whereby each received £1,000, with the copyright of his own treatise. They are: 1. *The Adaptation of External Nature to the Moral and Intellectual Constitution of Man*, by Thomas Chalmers, D.D. (Lond. 1833, 2 vols. 8vo). 2. *Chemistry, Meteorology, and the Function of Digestion, considered with Reference to Natural Theology*, by William Prout, M.D. (Lond. 1834, 8vo). 3. *On the History, Habits, and Instincts of Animals*, by the rev. William Kirby (Lond. 1835, 2 vols. 8vo). 4. *On Geology and Mineralogy*, by the rev. Dr. Buckland (Lond. 1837, 2 vols. 8vo). 5. *The Hand, its Mechanism and Vital Endowments, as Evincing Design*, by sir Charles Bell (Lond. 1837, 8vo). 6. *The Adaptation of External Nature to the Physical Condition of Man*, by John Kidd, M.D. (Lond. 1837, 8vo). 7. *Astronomy and General Physics, considered with Reference to Natural Theology*, by the rev. William Whewell (Lond. 1839, 8vo). 8. *Animal and Vegetable Physiology, considered with Reference to Natural Theology*, by Peter Mark Rogert, M.D. (Lond. 1840, 2 vols. 8vo). All these works have since been republished by Bohn.

BRIDLINGTON, or **BURLINGTON**, a sea-coast t. in the East Riding of Yorkshire (including Bridlington Quay, a port and bathing-place about 1 m. to the s.e.), 6 m. w. of Flamborough head, and 40 m. e.n.e. of York. B. is situated on a gentle slope in a recess of a beautiful bay. The country is hilly to the n., but subsides to the s. into a flat alluvial and fertile tract called Holderness. It has the aspect of an old town with narrow irregular streets. Pop. in '71, 6203. It has a considerable trade in corn, and also some soap-boiling and bone-grinding works. B. is supposed to have been the site of a Roman station. The Danes had strongholds in this vicinity for nearly 300 years, and many engagements between them and the Saxons and Normans occurred here. Great numbers of ancient tumuli or barrows still exist. An Augustine priory of immense wealth, and which subsisted for 400 years, was founded here by a grand-nephew of the conqueror, and obtained many privileges from Henry I., and also from king John. Some parts of it yet remain. In 1643, Henrietta, queen of Charles I., landed here with arms and ammunition from Holland bought with the crown-jewels. Bridlington Quay has a chalybeate mineral spring, as well as an intermitting one of pure water. B. is noted for its chalk-flint fossils. In the lacustrine deposits near B. were found, some years ago, the bones of a large extinct elk, with branching horns, measuring 11 ft. from tip to tip.

BRIDPORT, a t. in Dorsetshire, in a vale at the confluence of the Asker and the Birt, or Brit, or Bride, 16 m. w.n.w. of Dorchester, and 2 m. from the English channel. It stands on an eminence surrounded by hills, and consists chiefly of three spacious and airy streets. Pop. '71, 7670. The registered electors numbered (1875) 1071, including 15 freemen. They return one member to parliament. The chief manufactures are twine, shoe-thread, cordage, fishing-nets, and sail-cloth; and ship-building is carried on to some extent. The vicinity is celebrated for its cheese and butter. B. was a considerable town before the Norman conquest, and had a mint for coining silver. In 1873 there entered into this port 69 vessels whose tonnage was reckoned 6386; and there cleared it 36 vessels of collectively 3526 tons. On the coast near are sandy cliffs, 200 ft. high, abounding in fossils.

BRIE, an old district of France between the Seine and the Marne, Meaux being the chief town. B. was and is celebrated for its cheese and grain. In old times a forest covered a great portion of the region. It was subdued by the Franks, and was a part of the kingdom of Neustria. In the 9th c., it was ruled by its own counts, but in 1361 it passed to the crown. The district is now comprised in the departments of Aisne and those adjoining.

BRIEF, in the practice of the English bar, is the name given to the written instructions on which barristers advocate causes in courts of justice. It is called a B. because it is, or ought to be, an abbreviated statement of the pleadings, proofs, and affidavits at law, or of the bill, answer, and other proceedings in equity, with a concise narrative of the facts and merits of the plaintiff's case, or the defendant's defense. But it is also used in forensic business generally, being applied, not only in the courts of law and equity, but also in all other tribunals, whether inferior or superior, original or appellate. In Scotland, the corresponding term is *memorial*. The skill of the attorney or solicitor is shown in the preparation of this important document, which should be characterized by arrangement and compression, without any material omission.

BRIEF (*ante*), an abridged statement of a suitor's case. It should contain the names, residences, and occupations of the parties; the character in which they sue or are sued, and why they prosecute or defend; an abridgment of the pleadings; a regular chronological statement in plain language of the facts; a summary of the points at issue and of the proof to be offered, with names of witnesses, or of documents in case of written evidence, etc. The form and nature of the B. is necessarily varied according to the purpose which it is to serve.

BRIEF, or **BREVE**, **PAPAL** (Lat. *brevis*, short), a word which, in the corrupt Latinity of the early ages, was made to signify a short letter written to one or more persons

(hence the German *brief*, a letter). It is now used to denote certain pontifical writings, which, however, do not receive their name from the brevity of the composition, but from the smallness of the caligraphy. The papal B. differs from the papal bull (q. v.) in several points. It gives decisions on matters of inferior importance, such as discipline, dispensations, release from vows, indulgences, etc., which do not necessarily require the deliberations of a conclave of cardinals. Still, it is not to be confounded with the *notus proprii*, or private epistle of the pope as an individual, as its contents are always of an official character. His holiness speaks, as it were, with a kind of familiar parental of authority, and the B. is consequently superscribed *papa*, while the person to whom it is addressed is termed *dilecte fili* (beloved son). It is signed not by the pope, but by the *secretario de' brevi*, an officer of the papal chancery, with red wax, and only with the pope's private seal, the fisherman's ring; hence it concludes *Datum Romæ sub annulo piscatoris* (given at Rome under the ring of the fisherman). Like the bull, it is written on parchment, with this difference, that the bull is written on the rough side, and in ancient Gothic characters, while the brief is written on the smooth side, and in modern Roman characters.

BRIEG, a t. of Silesia, Prussia, about 27 m. s. e. of Breslau. It is situated on the left bank of the Oder, and on the railway between Breslau and Vienna, and is surrounded with walls, which have been partly converted into promenades. The streets are wide and regular, and commercially B. is a thriving town, its manufactures including linens, woollens, cottons, hosiery, ribbons, lace, leather, and tobacco. The battle-field of Mollwitz (q. v.) lies a little to the w. of Brieg. Pop. '75, 16,348.

BRIEL, BRIELLE, or THE BRILL, a fortified seaport t., on the n. side of the island of Voorne, s. Holland. It is situated near the mouth of the Maas, about 14 m. w. of Rotterdam, in lat. $51^{\circ} 54'$ n., and long. $4^{\circ} 10'$ east. B. possesses a good harbor, and is intersected by several canals. It has a pop. of (1876) 4205, the male portion of which are chiefly engaged as pilots and fishermen. B. may be considered as the nucleus of the Dutch republic, having been taken from the Spaniards by William de la Marck, in 1572. This event was the first act of open hostility to Philip II., and paved the way to the complete liberation of the country from a foreign yoke. In 1585, B. was one of the towns made over to England as security for certain advances made to the states of Holland; it was restored to the Dutch in 1616. B. was the first town of Holland, which, without extraneous aid, expelled the French in 1813. The celebrated admirals De Witt and Van Tromp were natives of this place.

BRIENNE-LE-CHATEAU, or, as it is now called, **BRIENNE-NAPOLEON**, a small t. in the dep. of Aube, France, on the right bank of the river Aube, and about 14 m. n. w. of Bar-sur-Aube. It is celebrated as the place where Napoleon I. received his earliest military education, he having entered the school here in 1779, when he was 10 years old, and remained until 1784. It is also remarkable on account of the battle fought here between the French and the allies in 1814. On the 29th of Jan., Bonaparte, who had collected his forces in the vicinity of B., with a view to check the advance of the allies on Paris, attacked Blucher, who was stationed in the town, and drove him out with considerable loss. In the struggle, the town, which was chiefly composed of wood, was almost reduced to ashes. On the 30th, the contest was renewed, and Blucher was forced to retreat to Trannes. On the following day, Napoleon deployed his forces in the plain between La Rothière and Trannes, and on Feb. 1, the corps of the crown-prince of Würtemberg and count Giulay, and the Russian reserves of grenadiers, having joined Blucher, prince Schwarzenberg gave orders to renew the combat. After a sanguinary struggle, during which Napoleon, feeling the importance of the contest, exerted all his influence over his troops, led several charges in person, and frequently exposed himself to danger, victory at length declared decisively for the allies at every point. During the night of Feb. 1, and the morning of the following day, the French troops retreated from Brienne-le-Chateau. The loss on both sides was about equal, consisting of nearly 5000 killed and wounded. The allies took 9000 prisoners, and 70 pieces of artillery. This victory at B. opened the way to Paris, and led to the fall of the empire.

BRIENZ, a t. of the canton of Bern, Switzerland, beautifully situated at the foot of the Bernese Alps, on the n. e. shore of the lake of the same name, and about 30 m. e. s. e. of Bern. Its cheese is held in high repute. Pop. '70, 2605.—The lake of B., which is about 8 m. long and 2 in breadth, is formed by the river Aar, at the foot of the Hasli valley, and by the same river it discharges its surplus waters into lake Thun. The lake is situated at an elevation of 1850 ft. above the sea; its average depth is about 500 ft., but in some places it is said to have a depth of more than 2000 feet. It is surrounded by elevated mountains, the principal of which is the Rothorn, from which splendid views of the whole range of the Bernese Alps are obtained. A small steamer plies daily on the lake between B. and Interlaken, touching at the celebrated Giessbach fall every trip.

BRIER CREEK, a stream in Warren co., Ga., where, in the revolution, the Americans under gen. Ashe were defeated Feb. 27, 1779, by the English under gen. Prevost; American loss about 250; English loss, 16.

BRIERLY HILL, an ecclesiastical district of Staffordshire, England, 2 m. n. e. from Stourbridge, on the Oxford, Worcester, and Wolverhampton railway. It is a place of much activity, the district abounding in coal, iron, and fire-clay; and there are here numerous collieries, large iron-works, glass-works, brick-works, and potteries. The manufacture of steam-boilers is extensively carried on. Pop. '71, 11,046.

BRIES, a t. in Hungary on the Gran; pop. '70, 11,776. The people are stock-breeders and farmers.

BRIEUQ, St., a seaport t., in the department of Côtes-du-Nord, France, situated on the right bank of the Gonet, about 2 m. from its mouth in the bay of St. B., a part of the English channel, in lat. 48° 31' n., and long. 2° 45' west. The town is said to owe its origin to an Irishman, St. Brieuc, who built a monastery here in the 5th century. St. B. has the ruins of an old tower that formerly defended the entrance to the river, but was partially blown up by order of Henri IV. in 1598, and a cathedral, part of which dates from the 11th century. The ramparts were destroyed in 1788, and their site has been converted into a pleasant promenade, terminating in a terrace that commands a fine view of the channel. St. B. has manufactures of woolen stuffs, linen, cotton, leather, paper, etc.; it has also ship-building yards, and a trade in agricultural produce. Pop. '76, 13,683.

BRIGADE, in the military service, is a group of regiments or battalions combined into one body. When a British army takes the field, it is customary for three battalions to form a *brigade*, and two brigades a *division*. Thus, at the battle of the Alma, each of the five divisions of British infantry comprised two brigades; and of these ten brigades, nine consisted of three battalions each, the tenth being somewhat stronger. It is nothing more than a temporary grouping, which can be broken up whenever the commanding officer thinks fit. The household troops, comprising the horse guards, life guards, and foot guards, are sometimes called the *household brigade*.

BRIGADE MAJOR is a military officer who exercises duties, in a brigade, analogous to those of the adjutant of a regiment. He attends to matters of discipline, and to the personal movements of the men. When regiments or battalions are brigaded, a B. M. is appointed, usually from among the captains. He conveys orders, keeps the rollster or roster, inspects guards and pickets, and directs exercises and evolutions; but he nevertheless remains on the books of a particular regiment, and returns to his regimental duties when the B. is broken up.

BRIGADIER, or **BRIGADIER-GENERAL**, is an officer of a regiment (usually a col. or lieut.col.), who, for a limited time and for a special service, is placed upon brigade duties. He is then a general or commander of a brigade, which usually contains his own regiment as one of the number. When the brigade is broken up, he falls back to his colonelcy, unless his services lead to his promotion to the rank of maj.gen.

BRIGANDINE, among the articles of armor worn during the middle ages, was an assemblage of small plates of iron, sewed upon quilted linen or leather, and covered with a similar substance to hide the glittering of the metal. It formed a sort of coat or tunic. The B. was named from the *brigans*, a kind of light-armed irregular corps, employed something like the Cossacks and Bashi-bazouks of recent days, and, like them, addicted to marauding and pilfering; hence the word *brigand*.

BRIGANTES. See BRITANNIA.

BRIG-ANTINE. A brig is a square-rigged vessel with two masts. A brigantine, or hermaphrodite brig, is a two-masted vessel, with the mainmast of a schooner and the foremast of a brig. A brig's mainsail is the lowest squaresail on the mainmast, whereas the mainsail of a brigantine is a fore-and-aft sail like that of a schooner.

BRIGGS, CHARLES FREDERICK, 1810-77; b. Mass.; a journalist and author known as "Harry Franco." He started the *Broadway Journal*, in New York, of which Edgar A. Poe became an associate editor the year following its establishment; and in 1853 he became the first editor of *Putnam's Magazine*, which he conducted for several years. At a later period he was connected with the *New York Times*. Some of his works are *The Adventures of Harry Franco*; *The Haunted Merchant*; and *The Trippings of Tom Pepper*. His latest editorial work was done upon the *Brooklyn Union* and *The Independent*, with the latter of which he was connected at the time of his death.

BRIGGS, GEORGE NIXON, LL.D., 1796-1861; b. Mass.; a lawyer and judge, member of congress, and for two terms governor of Massachusetts. He was for some time president of the Baptist missionary union.

BRIGGS, HENRY, a distinguished mathematician, was b. in 1556, at Warleywood, near Halifax, Yorkshire, and studied at St. John's college, Cambridge. In 1596, he was appointed first reader in geometry at Gresham house (afterwards college), London, and in 1619 first Savilian professor of geometry in Oxford. This office he retained till the time of his death, which took place at Oxford, Jan. 26, 1631. B. made an important contribution to the theory of logarithms, of which he constructed invaluable tables. Napier the inventor had, in 1614, published a table of the so-called natural logarithms, when B. observed that another system, in which the logarithm of 10 should be taken as unity, would afford great facilities of calculation. Napier admitted the improvement

on his own system, and intended to assist in carrying the plan into effect; but died in 1618, when the whole work was left to Briggs. In the same year he published his *Chiliad Prima Logarithmorum*, containing the first thousand natural numbers calculated to eight decimal places, and in 1624 published his *Arithmetica Logarithmica*, the fruit of many years of unwearied application, and giving the logarithms of natural numbers from 1 to 20,000, and from 90,000 to 101,000, with 15 places. His system of logarithms is that now commonly adopted. Leaving others to carry out his calculations, for which he had provided every facility, he next employed himself on a table of logarithms of sines and tangents, carried to the hundredth part of a degree, and to 15 places, which, with a table of natural sines, tangents, and secants, was posthumously published at Gouda, in Holland, 1633, under the title of *Trigonometria Britannica*.

BRIGHAM, AMARIAH, 1798-1849; b. Mass.; a physician who devoted great attention to the cause and cure of insanity. He was superintendent of the retreat for the insane in Hartford, Conn., and of the New York state asylum. While at the latter institution he gave lectures and established the *Journal of Insanity*. Among his works are *Mental Cultivation and Excitement*; *The Influence of Religion upon the Health and Physical Welfare of Mankind*; and *The Anatomy, Physiology, and Pathology of the Brain*.

BRIGHAMIA, plants of the lobelia family discovered in the Sandwich islands. The *B. insignis* bears sweet-scented, showy, and abundant flowers which last for several months. It is a favorite in English conservatories. The juice is said to be a specific for some cutaneous diseases.

BRIGHT, JESSE D., b. New York, 1812. Early in life he settled in Indiana as a lawyer, and became state senator and lieutenant-governor. In 1845, he was elected to the United States senate, where he served 18 years. In 1862, he was expelled from the senate for having written to Jefferson Davis as "President of the Confederate States," recommending to him a man who desired to furnish arms for the rebels.

BRIGHT, JOHN, a popular politician, first brought into notice by the anti-corn-law agitation, son of Jacob Bright, a Quaker cotton spinner and manufacturer at Rochdale, Lancashire, was b. at Greenbank, near that town, Nov. 16, 1811. In 1835, he made a foreign tour, which included a journey to Palestine, and, on his return, delivered before a literary institution at Rochdale, of which he was one of the founders, lectures on the subject of his travels, and on topics connected with commerce and political economy. When the anti-corn-law league was formed in 1839, he was one of its leading members, and, with Mr. Cobden, engaged in an extensive free-trade agitation throughout the kingdom. In the spring of 1843, he offered himself as a candidate for the representation of Durham, and, though at first unsuccessful, he became, in July of the same year, M.P. for that city. At all times an animated and effective speaker, B. was incessant, both at public meetings and in parliament, in his opposition to the corn laws, until they were finally repealed. In 1845, he obtained the appointment of a select committee of the house of commons on the game laws, and also one on the subject of cotton cultivation in India. An abridgment of the evidence taken before the former, published in one volume, contained from his pen an *Address to the Tenant Farmers of Great Britain*, strongly condemning the existing game laws. At the general election of 1847, he was elected one of the members for Manchester. He co-operated with Mr. Cobden in the movement in favor of financial reform. On the formation of the first Derby ministry, Feb. 27, 1852, B. aided in the temporary reorganization of the corn-law league, in favor of the principles of free trade; and at the general election which followed, was re-elected for Manchester. A member of the peace society, and strenuously opposed to the war with Russia in 1854, B. was one of the meeting of the society of Friends, by whom a deputation was sent to the emperor Nicholas to urge upon him the maintenance of peace; and in 1855 he energetically denounced the Crimean war. A severe illness compelled him to withdraw for a time to the continent, and in his absence he was rejected by Manchester. Elected in 1857 for Birmingham, he seconded the motion against the second reading of the conspiracy bill, which led to the overthrow of lord Palmerston's government. His name then became chiefly associated with the movement for reforming the electoral representation, which resulted in the act of 1867. In 1868, he accepted office as president of the board of trade, but in 1870 was again obliged to retire, in consequence of severe illness. His health having been partially restored, he held office in 1873-74 as chancellor of the duchy of Lancaster. A collection of his *Speeches* was published in 1868.

BRIGHT, RICHARD, 1789-1858; an English physician educated at Edinburgh; practiced with great success in London, becoming physician to Guy's hospital. His speciality was morbid anatomy and the connection between morbid symptoms and alterations of structure of the internal organs. He discovered that an albuminous condition of the urine, accompanied with dropsical effusions, was dependent on a peculiar degeneration of the kidneys, whence the disease in which these conditions occur was called Bright's disease. His publications on this topic were made in 1836-40.

BRIGHTENING, in calico-printing, is the operation of rendering the colors of printed fabrics more bright or brilliant, by boiling them in solutions of soda and other materials.

BRIGHTON, a former t. in Middlesex co., Mass., 4 m. w. of Boston on the Albany and Boston railroad; pop. '70, 4957. It is famous as the great cattle-market of Boston and the east. It has besides some manufacturing establishments. Since 1873 it has been a part of Boston.

BRIGHTON, originally Brighthelmstone, a t. and a celebrated watering-place on the sea-coast of Sussex, 50½ m. s. of London. It is built on a slope ascending eastward to a range of high chalk-cliffs (backed by the South Downs), bounding the coast as far as Beachy Head; to the west, these hills recede from the coast, and leave a long stretch of sands. Anciently, Brighthelmstone was a mere fishing-village on a level under the cliff; and more than once it was burnt and plundered by French marauders. It was fortified by Henry VIII., and more strongly by Elizabeth; but the sea proved more dangerous than the French, and now washes over the site of the village of those days. The inroads of the sea in 1699, 1703, and 1705, undermined many cliffs and destroyed many houses. Its further inroads are prevented by a sea-wall of great strength (60 ft. high, 23 ft. thick at the base, and 2 m. long), extending along the cliffs, and built at the cost of £100,000. The writings of Dr. Russel, a celebrated physician of George II.'s time, first drew public attention to B. as an eligible watering-place, and the discovery of a chalybeate spring in the vicinity increased its popularity. The visit of the prince of Wales in 1782, and his subsequent yearly residence there, finally opened the eyes of the fashionable world to its immense attractions, and B. thenceforth became the crowded resort of a health-seeking population. Its progress has been very rapid, and the town is still steadily increasing. B. is for the most part extremely well built, as becomes a favored retreat of wealth and aristocracy. It mostly consists of new and elegant streets, squares, and terraces. The hotels are magnificent. A range of splendid houses fronts the sea for nearly 3 m., including the famous sea-wall, and the beach is easily accessible by gaps in the chalk-cliffs. Formerly, trees were a great rarity in B.; but within the last thirty years they have been planted both in and around the town, and are now to be seen of considerable size in the North Steyne Inclosures, the Level, and the Queen's park. Pop. in 1801, 7339; in '21, 24,429; in '51, 65,569; in '71, 90,011. B. returns two members to parliament. The population is greatly increased during the fashionable season by the influx of visitors. The town was incorporated in 1854. Living and house-rent are about a third higher than in London. Near the center of the town is the pavilion or marine palace, a fantastic oriental or Chinese structure, with domes, minarets, and pinnacles, and Moorish stables, begun for the prince of Wales in 1784, and finished in 1827. It is now the property of the corporation of B., and with its fine pleasure-grounds of above seven acres, it is devoted to the recreation of the inhabitants. It stands in the Steyne, an open space between the e. and w. parts of the town. The marine parade, a fine terrace, extends about a m. along the margin of the cliff, between the Steyne and Kemp town, a handsome district on the east. Westward, there is a similar parade or promenade, extending a great length in front of the more modern part of the town, and here there is daily a large and fashionable concourse. There are two piers—a chain pier on the e., opposite the marine parade, and a broad wooden pier on piles on the w.; both are used for promenading. A magnificent aquarium, 715 ft. in length, was opened in 1872. B. has no maritime trade. It is reputedly a town for recreation and sea-bathing. Its only defect is a want of trees to shade the promenades; the sea-breeze being adverse to the growth of trees. B. possesses several large public hotels, and is more particularly noted for its excellent private hotels or boarding houses, locally known as "mansions." B. is connected with London, and also with the towns along the coast, by railways. From its salubrity, the town abounds in boarding-schools.

BRIGHT'S DISEASE (of the kidneys), so called after the English physician, Dr. Bright, who first investigated its character, consists of a degeneration of the tissues of the kidney into fat, and will be better understood after the anatomy of the organ has been studied. Suffice it to say now, that this degenerated condition impairs the excreting powers of the organ, so that the urea is not sufficiently separated from the blood. The flow of the latter, when charged with this urea, is retarded through the minute vessels, congestion ensues, and exudation of albumen and fibrin is the result. When we apply heat to the urine from a kidney so affected, it becomes opaque, showing that it contained *albumen* (q.v.); and on examining a drop of it under the microscope, we observe the exuded lymph mixed with epithelium in the form of casts of the small ducts of the diseased organ. The patient presents a flabby, bloodless look, is drowsy, and easily fatigued. The disease may succeed any of the eruptive fevers, and is frequently associated with enlargement of the heart.

The *causes* of this terrible malady are any which cause congestion of the kidneys—indulgence in strong drinks, long-continued suppuration, exposure to wet and cold, the exanthematous fevers, and pregnancy. The indications for *treatment* are, to remove any of those causes which may be present, rectify the other secretions, relieve any temporary congestion of the kidneys, at the same time endeavoring to increase the number of red blood globules by the administration of iron and vegetable bitters. And in the advanced stages, when the blood is poisoning the nervous centers, attempts should be made to restore the secretion of urine by administering diuretics (q.v.), by giving hydrochloric

and vegetable acids, sponging the patient with vinegar, and relieving the congestion of the brain by purgatives and local bleeding.

BRIGITTINES, or **ORDER OF OUR SAVIOUR**, founded in 1344, as a branch of the Augustinians, by St. Brigida or Brigitta, of Sweden. There were both monks and nuns who inhabited contiguous buildings, but were said never to see each other. Temporal affairs were supervised by the nuns; spiritual by the monks. The northern kingdoms of Europe had monasteries of this order, but the reformation swept them away. Henry V. founded one house near London; Henry VIII. suppressed it; Mary re-established it; and Elizabeth finally suppressed it. There are now no monks of the order. A few convents existed in 1860 in Bavaria, Poland, and elsewhere.

BRIGNOLES, a t. in the department of Var, France, beautifully situated in a fertile valley, surrounded by forest-clad hills, and watered by a stream called the Calami, about 22 m. w.s.w. of Draguignan. B., which is a very salubrious place, has manufactures of broadcloth, silk twist, soap, leather, pottery, etc.; and a trade in wines, brandy, olives, and prunes. Pop. '76, 5164.

BRIHUEGA, a t. of New Castile, Spain, 20 m. e.n.e. of Guadalajara, is situated on the Tajuña, and was formerly surrounded by walls, of which traces still exist. The remains of an old Moorish fortress now serve as a cemetery. B. has manufactures of woollens, linen, glass, and leather. Pop. 4500. Here, in 1710, during the war of the succession, the English general Stanhope, owing to the dilatoriness of his allies in affording him support, was defeated by the Duke de Vendôme, and compelled to surrender, with all his force, amounting to about 5500 men.

BRIL, the name of two Dutch painters.—**MATTHÆUS B.**, b. at Antwerp, 1550, went during his youth to Italy, and, under the patronage of pope Gregory XIII. painted several frescos in the Vatican. He was also distinguished as a historical and landscape painter. He died in 1584. His more celebrated younger brother, **PAUL B.**, b. 1554 or 1556, received instruction under Matthæus in Rome, and soon excelled his master. His pieces were at first conceived in the fantastic style which then prevailed; but gradually his style increased in power and beauty, until it exerted a striking influence over landscape-painting. The works of his riper age exhibit high poetical qualities, and a fine appreciation of the effects of light in the sky, which have been described as but little inferior to those of his great successor, Claude Lorraine. They have a character of solemn rest and calmness, and at times even an elegiac tone of melancholy, which well accords with representations of the glories of fallen Rome. A collection of excellent landscapes by B. is found in the palace Rospigliosi in Rome, and two beautiful landscapes enrich the gallery of the Pitti palace, Florence. Besides landscapes, B. painted scenes from Biblical history; among them, the "Tower of Babel," now in the Berlin museum. Other pictures by B. are found in the galleries of Munich, Vienna, and the Louvre. He died at Rome in 1626.

BRILL, *Rhombus vulgaris*, a fish of the same genus with the turbot (q.v.), found in considerable abundance on some parts of the British coasts, and common in the markets of the larger towns. It resembles the turbot more than any other British species of this genus, but is at once distinguished by its inferior breadth, which (excluding the fins) is only equal to half its entire length; by the want of tubercles on the upper surface; by a few of the most anterior rays of the dorsal fin being elongated beyond the membrane; and by the coloring, which is reddish sandy-brown on the upper side, varied with darker brown and sprinkled with white pearly spots, the under side being (as in the turbot) white. The B. is taken both in sandy bays and in deep water. Although considered very inferior to the turbot, it is yet much esteemed for the table. It seldom or never attains so great a size as the turbot, rarely exceeding 8 lbs. in weight.

BRILLAT-SAVARIN, **ANTHELME**, 1755-1826; a French author, deputy in the states-general in 1789; judge of the court of cassation in 1792; the next year mayor of Bellay, but obliged to fly from the revolution. He came to New York, where he lived for three years, teaching French and playing in the orchestra of a theater. He returned to France in 1796, and under the consulate again became a judge. He wrote on political economy, and on the archæology of the department of Ain, but is best known by his *Physiology of Taste*.

BRILLIANT is a popular name given to the diamond when cut in a particular way. See **DIAMOND**.

BRIMSTONE (Saxon *brenne-stone*, a stone that burns) is the commercial name for sulphur (q.v.), in sticks or rolls.

BRINDISI (the ancient *Brundisium* or *Brundisium*), a seaport t. of southern Italy, in the province of Lecce, is situated on a small promontory in a bay of the Adriatic sea, about 45 m. e.n.e. of Taranto. B. is a city of very great antiquity. It was taken from the Sallentines by the Romans 267 B.C., who some 20 years later established a colony here. The town, partly owing to the fertility of the country, but chiefly on account of its excellent port—consisting of an inner and outer harbor, the former perfectly landlocked, and capable of containing the largest fleets and of easy defense on account of its narrow entrance, and the latter also very well sheltered—rapidly increased in wealth and

importance. It soon became the principal naval station of the Romans in the Adriatic. In 230 B.C., B. was the starting-place of the Roman troops that took part in the first Illyrian war; and from this point the Romans nearly always directed subsequent wars with Macedonia, Greece, and Asia. And when the Roman power had been firmly established beyond the Adriatic, B. became a city second to none in south Italy in commercial importance. Horace, who accompanied Antony in a hostile movement on B. in 41 B.C., has made the journey the subject of one of his satires (*Sat.* i. 5). Virgil died here in 19 B.C., on his return from Greece. The city appears to have retained its importance until the fall of the empire, but it suffered greatly in the wars which followed. When the Normans became possessed of it in the 11th c., the Crusaders made it their chief port for embarkation to the Holy Land; but with the decline of the crusades, B. sank into comparative insignificance as a naval station. The city subsequently suffered greatly from wars and earthquakes. The principal buildings are the cathedral, where the emperor Frederick II. was married to Yolanda in 1225; and the castle, commenced by Frederick II., and finished by Charles V. The district around B. is still remarkable for its fertility, olive oil being produced in large quantities. Some years ago, B. was constituted an entrepot for foreign goods. Since the establishment of the overland route to India, B. has greatly increased, being the most convenient point of departure for the east from northern and central Europe. The extensive and well-sheltered harbor has undergone great improvement, and a substantial bulwark has been built across the n. arm to prevent it from being filled with sand. In 1874, 939 vessels, of 380,069 tons, cleared the port. Pop. 9105.

BRINDLEY, JAMES, an eminent English mechanic and engineer, b. in Thornsett, near Chappell-le-Firth, Derbyshire, in 1716. Apprenticed at 17 to a millwright, he afterwards became an engineer, and in 1752 showed great ingenuity in contriving a water-engine for draining a coal-mine. A silk-mill on a new plan, and several others of his works, recommended him to the duke of Bridgewater (q.v.), who employed him to execute the canal between Worsley and Manchester. Thenceforth he devoted his great skill and genius to the construction of navigable canals; commenced the Grand Trunk, and completed the Birmingham, Chesterfield, and others. Once, when under examination before a committee of the house of commons, being jocularly asked for what purpose he supposed rivers to have been created, he is said to have replied: "Undoubtedly to feed navigable canals." He died in 1772.

BRINE is the term applied to water highly impregnated with common salt, and **BRINE SPRINGS** are those natural waters containing much salt, which in many parts of the world gush out from fissures in the ground. See **SALT**.

BRINE-SHRIMP, *Artemia salina*, a small crustacean, of the order *branchiopoda* (q.v.), which, unlike the greater number of animals of that order, is an inhabitant not of fresh but of salt water, and is indeed remarkable, because it is to be found in myriads swimming about in the brine of salt-pans previous to boiling, when, having been concentrated by exposure to sun and air for about a fortnight, it destroys the life of almost all other marine animals. The full-grown B. is about half an inch long. The little animal is almost transparent, and is extremely active and graceful in its movements. The workmen at salt-pans so confidently ascribe to it the rapid clearing of the brine in which it occurs, that when it does not appear in their *salterns*, they transport a few from other salterns. They multiply with extraordinary rapidity.

BRINJAREE DOG, a rough-haired or long-haired variety of greyhound (q.v.), used in the Deccan, and said to be the best of the hunting-dogs of India. It is said to be superior in size and strength to the Persian greyhound, but not to be equal to the British greyhound in swiftness. It is generally of a yellowish or tan color.

BRINVILLIERS, MARIE MARGUERITE, Marquise de, notorious as a poisoner in the time of Louis XIV., was the daughter of Dreux d'Aubray, lieutenant of Paris, and received a careful education. In 1651, she was married, while still young, to the marquis de Brinvilliers. This nobleman seems to have been a gay and careless spendthrift, who allowed his wife to do very much as she pleased. He even introduced to her a young officer named Jean Baptiste de Gaudin, Seigneur de St. Croix, who was exceedingly handsome, and who inspired her with a violent passion. Her easy husband, however, was wholly indifferent to his wife's conduct; but her father, who seems to have had a stricter sense of duty, caused St. Croix to be arrested and imprisoned in the Bastille. It was here the latter learned the art of preparing poisons, from an Italian, and on his release he imparted his fatal knowledge to his mistress, who, during his incarceration, had affected the greatest piety, spending most of her time in visiting the hospitals and in attending the sick. The marchioness now resolved to destroy her father. St. Croix eagerly abetted her, in the hope of obtaining a portion of the paternal inheritance; but in order to test the efficacy of the poison, she tried its effects upon the invalids of the *hôtel Dieu*. Having satisfied herself, she commenced operations on her parent, kissing and poisoning him continually for eight months, until her diabolical patience was exhausted, and she was at last induced to administer a very violent dose. He died, and no one suspected the marchioness. With St. Croix's assistance, and that of a domestic servant, Jean Amelin, *alias* Chaussée, she next poisoned, with the same fearful indiffer-

ence to crime, her two brothers and her sisters; her object being to find means of supporting her extravagant style of living with her paramour. Several times she attempted to poison the marquis, her husband; but he escaped, and, as was said, by means of antidotes given by St. Croix, who dreaded that he should be compelled to marry the widow. St. Croix died suddenly in 1672—his glass mask having fallen off while he was engaged in preparing a poison—leaving documents inculcating the marchioness. She was also accused about the same time by her accomplice Chaussee, who being arrested, confessed all, and was condemned to be broken alive. The marchioness escaped to England; afterwards she traveled into Germany, and next went to Liege, where she took refuge in a convent. From this, however, she was craftily decoyed by an officer of justice disguised as an abbé, and conveyed to Paris. Among her papers was found a general confession of her crimes, including the above-mentioned murders, and many others. One strange confession stated that, out of pity for a virtuous young lady who had been imprisoned in a convent, the marchioness had poisoned a whole family! It is a singular fact, that this infamous woman was a bigot in her religious tenets, and was quite exemplary in her attendance at church. At her trial in Paris, she at first denied all charges brought against her, and pretended that the "general confession" had been written during the insanity caused by a fever; but after being put to the torture, she made a full confession, and was beheaded, July 16, 1676. Her career had excited such terror in France, that Louis XIV. instituted a distinct tribunal, the *chambre ardente* (q.v.), to investigate cases of poisoning by the "succession powder" used by the marchioness.

BRION, GUSTAVE, b. 1824; a French painter. Among his chief works are "The Potato Harvest during the Inundation," "A Funeral in the Vosges," "A Marriage in Alsace," and "The Sixth Day of Creation." The latter has been exhibited in New York.

BRION, LUIS, 1782–1821; an admiral in the Colombian service, who served in the army of Holland, studied navigation in the United States, and in 1811 was appointed captain of a frigate in the service of Caraccas. Subsequently he fitted out a fleet by his own exertions and drove the Spaniards from the island of Margarita. He was also distinguished in the conquest of Guiana, and at Cartagena and Santa Marta.

BRIOUDE, a t. of France, in the department of Haute-Loire, situated near the left bank of the river Allier, about 29 m. n.w. of Le Puy. It occupies the site of *Brievos*, a town of the ancient Averni. Its principal buildings are the college and the church of St. Julien, founded in the 9th c., on the site of a still more ancient edifice erected on the spot where the saint was martyred. B. has manufactures of linen and woolen, and a trade in the agricultural produce of the district. Lafayette was born here. Pop. '76, 4643.

BRISBANE. 1. B., an inland co. of Queensland, about 120 m. n.w. of Sydney.—2. B., a seaport, the capital of Queensland, about 640 m. n. of Sydney. It stands near the mouth of a river of its own name, which falls into Moreton bay. Regular steam communication is kept up with Sydney and other Australian ports. B. possesses some fine buildings, among the chief of which are the houses of legislature, which cost £100,000, the post-office, and the viceregal lodge. There are 51 churches. Pop. '76, 26,911.—3. B., the river just mentioned. It rises in the main ridge which divides the rivers of the interior from those of the coast.—All the foregoing are named after the subject of the succeeding article.

BRISBANE, General Sir THOMAS MAKDOUGAL, a distinguished soldier and astronomer, was b. at Brisbane, the hereditary seat of his family, near Largs, Ayrshire, July 23, 1773. At the early age of 16 he entered the army as an ensign, and in the following year, when quartered in Ireland, he formed an intimate acquaintance with Arthur Wellesley, afterwards duke of Wellington. With a company he had raised in Glasgow in 1793, B. took part in all the engagements of the campaign in Flanders; and in the West Indies, to which he was sent in 1796, he greatly distinguished himself under sir Ralph Abercromby. He afterwards served in the West Indies as col. of the 69th; and in 1812 obtained command of a brigade under the duke of Wellington in Spain. For his conspicuous bravery at the battle of the Nive he received the thanks of parliament. When Napoleon abdicated, B. was sent in command of a brigade to North America, from whence he was recalled in 1815, but too late to admit of his being present at Waterloo. In 1821, B., on the recommendation of his friend the duke, was appointed governor of New South Wales, a position he held for four years, during which time he introduced many wise reforms, especially in penal treatment; secured at his own expense good breeds of horses for the colony; promoted the cultivation of the sugar-cane, vine, tobacco, and cotton; and left at the close of his administration—which was marked by perfect tolerance and protection of all classes of Christians—50,000 acres of cleared land where he had found only 25,000. But high as B. ranks as a soldier and administrator, as a man of science he holds a still higher place. While in Australia, he catalogued no less than 7385 stars, for which great work—known as "the Brisbane Catalogue of Stars"—he received the Copley medal from the royal society. On his return to Scotland, he had an astronomical observatory established at his residence at Makerston, and devoted himself entirely to scientific pursuits. He entered warmly into the plans of the British association for ascertaining the laws of the earth's magnetism, and in 1841 had a splendid magnetic observatory

erected at Makerstoun, the observations made there filling three large volumes, published in the *Transactions of the Royal Society of Edinburgh*, of which he was president, having been elected on the death of sir Walter Scott. He founded two gold medals for scientific merit—one in the award of the royal society, the other in that of the society of arts. He died Jan. 27, 1860.

BRISSET, JEAN PIERRE, one of the first movers in the outbreak of the French revolution, and afterwards numbered among its victims, was b. at Chartres in 1754, and educated for the bar. After completing his studies at Paris, he went into the office of a procurator, but quickly abandoned the legal profession for the more congenial one of authorship. From his earliest years he had devoted himself with passionate eagerness to literary studies, especially history, economy, and politics, and, among the other lingual accomplishments, acquired a thorough mastery of English. His first work, *Théorie des Lois Criminelles* (1780), gained the approbation of Voltaire and D'Alembert, and was followed by his *Bibliothèque des Lois Criminelles*, which established his reputation as a jurist. Having removed to London, he there started a learned journal, under the title *Lyceum*, for which, however, he found no adequate support. He therefore returned to Paris, and soon afterwards was imprisoned in the Bastille, on a charge of having written against the queen a brochure, which, in fact, was penned by the marquis de Pelleport. After four months in the Bastille, he was liberated through the intervention of Madame de Genlis and the duke of Orleans. B. continued to write tracts on finance, etc., but his love of freedom and vehement hatred of despotism again involved him in danger, and, to escape from a *lettre-de-cachet*, he was once more compelled to retire to England. He afterwards visited North America, as representative of the *Société des Amis des Noirs*. On his return to France, he zealously assisted in the outbreak of the revolution, and was in consequence elected by the citizens of Paris their representative in the constituent assembly, where he exercised a predominant influence over all the early movements of the revolution. He also established a journal, called *Le Patriote Français*, which became the recognized organ of the earliest republicans; and, through his superior knowledge of politics and the usages of constitutional countries, he gathered round him all the young men of talent and spirit who were opposed to the court-theory of absolute sovereignty. It thus happened that, without his being formally considered the head of a party, all the movements of the early revolutionists were profoundly influenced by him, and he incurred the bitter hatred of the court reactionists, who affixed the nickname of Brissotins to all the advocates of reform. Afterwards, the Brissotins formed the Girondist party. In the convention, B. was representative of the department Eure-et-Loir. Here his moderation made him suspected as a friend of royalty, as he opposed the "men of September" and the trial and condemnation of the king. When Louis XVI. heard his doom pronounced, he exclaimed: "I believed that Brissot would have saved me!" But B. was weak enough to imagine that the best way to save the king would be to vote first for his death, and then appeal to the nation. B. and his party, which was perhaps the purest in principle and the weakest in action, ultimately fell before the fierce accusations of the Mountain, or Jacobin party, which believed, or at least pretended to believe, that the virtuous B. had received money from the court to employ against the revolution. With 20 other Girondists, B. suffered death under the guillotine, Oct. 30, 1793.

BRISTED, CHARLES ASTOR, son of the Rev. John Bristed, grandson of John Jacob Astor, b. N. Y., 1820. He was educated at Yale and at Trinity college, Cambridge, Eng., graduating in 1845. For several years he was a contributor to periodical literature over the signature of "Carl Benson." He was one of the first board of trustees of the Astor library. Among his collected works are: *The Upper Ten Thousand of New York; Selections from Catullus; Five Years in an English University; The Interference Theory of the Government;* and *Letter to Horace Mann*, in which he replied to attacks upon John Jacob Astor and Stephen Girard.

BRISTED, JOHN, 1778-1855; b. England; clergyman and author, who practiced law in New York, and married John Jacob Astor's daughter. In 1829, he became rector of an Episcopal church in Rhode Island. He published *Edward and Anna*, a novel; *The Resources of the United States;* *Thoughts on Anglican and American Churches*, etc.

BRISTLES, the strong hairs growing on the back of the hog and wild-boar, and extensively used in the manufacture of brushes, and also by shoemakers and saddlers. They form an important article of British import, between 2 and 3 million pounds being annually imported, chiefly from Russia and Germany; but they are also obtained from France and Belgium, and small quantities of inferior quality have recently been received from China. From Russia, the average annual value of B. imported into Britain is £300,000, Siberia alone supplying about £150,000. Russian B. vary in value from £6 to £60 per cwt. From Germany, about £100,000 worth per annum is received, varying from £6 per cwt. to £35 per cwt. From France and Belgium, about £20,000, varying in value from 2s. to about 4s. 6d. per pound. The quality of B. depends on the length, stiffness, color, and straightness—white being the most valuable. The best bristles are produced by pigs that inhabit cold countries. The Russian hog is a long, spare animal, and the thinner the hog, the longer and stiffer the bristles. When the Russian hog is sent to the south and fattened, the B. become soft, and of course depreciated in value. In the summer, the hogs are driven in herds through the forests, to feed on soft roots, etc., when

they shed their B. by rubbing themselves against the trees. The B. are then collected, sewed up in horse or ox hides, and sent to fairs, whence they find their way, through agents, to all countries.

BRISTOL, a co. in s.e. Mass., bordering on Rhode Island and the ocean, 517 sq.m.; pop. '75, 131,087; in '80, 139,089. It is drained by Pawtucket and Taunton rivers, and has nearly 20 m. of sea-coast. There is considerable agriculture, but the main business is manufacturing of cotton, wool, etc. There are four railroads intersecting the various parts of the county. Co. seat, Taunton.

BRISTOL, a co. in c. Rhode Island, bordering on Mass.; 25 sq.m.; pop. '70, 9421. It has an uneven surface, with some fine scenery, and fertile soil. Two railroads traverse its territory. Co. seat, Bristol.

BRISTOL, a t. in Hartford co., Conn., 18 m. w.s.w. of Hartford, on the Fishkill railroad; pop. 3788; has great clock factories, foundries, machine-shops, etc.

BRISTOL, a t. in Bucks co., Penn., on the Delaware, about 20 m. above Philadelphia, opposite Burlington, N. J.; pop. '70, 3269. It is at the terminus of the Delaware branch of the Pennsylvania canal, and has railroad connection with New York and Philadelphia.

BRISTOL, a t. in Rhode Island, on the peninsula dividing Mt. Hope and Narraganset bays, 16 m. s.e. from Providence; pop. '70, 5302; in '80, 6036. The town is interesting as the site of the residence of king Philip, the great Narraganset chief, who was slain here in 1676. B. is a port of entry, has a large manufacturing interest, and is much frequented as a place of summer resort. In the revolutionary war it was bombarded by the English, and the greater part of the village was burned.

BRISTOL, an important maritime city in the w. of England, long. $2^{\circ} 35' 28''$ w., lat. $51^{\circ} 27' 6''$ n., upon the rivers Frome and Avon, and partly in the counties of Gloucester and Somerset, joined with the former for ecclesiastical and military purposes, but otherwise a city and co. in itself. The ratable value in 1872 was £551,048. The ancient portion of B. consists almost entirely of shops, warehouses, offices, manufactories, and other commercial buildings. The streets are, with few exceptions, narrow and irregular; but great improvements have been effected in them recently at a cost of half a million sterling, and there are many handsome shops, and other buildings of a superior character. Among the latter may be especially mentioned the banking-house of the West of England company, the assize court and guild hall, bank of England, general hospital, Colston hall, and Victoria rooms. A great central terminus has been erected for the various railways. The most remarkable modern structure, however, is the suspension bridge over the Avon, at Clifton, which is 702 ft. in span, and 245 ft. above high-water. Among the ancient buildings are the church of St. Mary Redcliffe, the cathedral, and Temple church, remarkable for its leaning tower. Some remains still exist of the ancient castle and walls, traces of British encampments at Clifton and Leigh, and considerable Druidic vestiges at Stanton Drew. The modern portions of B., including Clifton, Cotham, Redland, etc., consist of handsome residences, in squares, terraces, crescents, and detached villas, and some creditable specimens of architecture in churches, chapels, assembly and club rooms. The population of B. proper was, in 1871, 62,662, and of the suburban districts, 141,378—total, 204,040, steadily increasing; total included in the municipal boundary, 182,552. The floating harbor and quays extend for more than a mile through the city, and are formed by embanking and locking the old courses of the rivers, which now flow through a new channel cut at a cost of about £6 0,000. There were entered inwards with cargoes during the year 1876, 9041 vessels, with a tonnage of 1,090,106, engaged in the foreign and coasting trade. The clearances outwards show 4496 vessels and 628,170 tons. The customs duties on imports produced in the same year £685,538, against £1,030,132 in 1872. The total value of the imports for 1876 was £7,279,147, against £7,057,036 in 1872. The chief trade is with Canada and the United States, West Indies and South America, Portugal, the Mediterranean, Russia, Mauritius, Turkey, France, and w. coast of Africa. The principal exports are iron, tin-plate, copper and brass, coal, salt, and manufactured goods, to the annual value of about £400,000. The manufactures are chiefly cotton goods, glass, refined sugar, earthenware, lead, chemicals, leather, and floor-cloths. The ship-building yards have the reputation of turning out excellent sea-going vessels. The *Great Western*, the pioneer of steam-communication across the Atlantic, the *Great Britain*, and the ill-fated *Demerara*, were built here. The railways terminating in Bristol are—the *Great Western* from the e.; the *Midland* from the n., with a branch to Bath; the *Bristol and Exeter* from the w.; the *North Somerset* from the s.; the *Great Western* line communicating with South Wales, and short branches to Avonmouth and Portishead. B. returns two members to the house of commons; the number of electors was, in 1875, 22,124. The municipal government is vested in a mayor, 16 aldermen, and 48 town-councilors, a lord-lieutenant, and lord high steward. The police arrangements are efficient, and the city has a large jail which is about to be reconstructed on a new site. The benevolent institutions of B. are numerous and well supported. The most important are the infirmary, the general hospital, the blind asylum, orphan asylum, asylum for deaf mutes, alms-houses, reformatories, etc., and the extraordinary Ashley Hill asylum, for 2050 orphans, built and main-

tained without any provision for meeting expenses, except the unsolicited contributions that happen to be sent to it. Among charitable institutions must also be reckoned the well-endowed Colston, city, and Red Maids schools, and other free schools. For the better classes, the educational establishments are Clifton college and the grammar school, and many proprietary and private schools; there are also a medical school, fine arts academy, and trade school. Of places of worship in B., 57 belong to the church of England, 29 to Wesleyan communities, 24 to Independents, and about 36 to other sects. The first records of the history of B. speak of it under the ancient British name of Caer-oder; it then became a stronghold of the Romans; on their departure, was again occupied by the Britons, until, in 584, the Saxons drove them out, and giving it the name of Brightstowe or Briestowe, made it a thriving place of trade—aboriginal slaves being a principal item in the commerce. It was sacked by the Danes. Henry III. gave it the rights of a corporate town; Edward III., those of a city and county in itself. In 1247, the parishes of Redcliffe, Temple, and St. Thomas were added to Bristol. During the civil wars, it was alternately taken by royalists and parliamentarians, and by the latter the castle and fortifications were razed. It afterwards became the principal port for trade with the West Indies, and carried on a flourishing business in negro slaves. In 1793, the "bridge riots" occurred. In 1804 the docks were begun, and in 1809 they were opened to shipping. In 1831, the "reform bill riots" resulted in the destruction of the bishop's palace, custom-house, excise-office, jail, toll-houses, a number of private residences, and several lives. The bill itself, by the addition of Clifton, etc., gave the city its present municipal boundaries. Among the names of note identified with the history of B. are those of the Fitzhardinge family; William of Worcester; Canynge, the great merchant and restorer of Redcliffe church; Colston and Whitson, the merchants and philanthropists; Sebastian Cabot, the navigator, said to have anticipated the discovery of America by Columbus; the poets Southey and Chatterton; Lawrence and Baily, artists; Sydney Smith, canon of Bristol cathedral; Robert Hall, Coleridge, and Hannah More; the Misses Porter; Dr. Prichard, Dr. Carpenter, and Miss Mary Carpenter.

BRISTOL BAY, an arm of the Pacific ocean, in Russian America, lying immediately to the n. of the peninsula of Alaska. B. B. receives the waters of two considerable lakes, which, communicating with each other, offer an opening into the interior.

BRISTOL BRICK, or **BATH BRICK**, formerly made only in Bristol, Eng., but now made in New Hampshire and other parts of the United States. It is composed of fine-grit sand, and used mainly for cleaning and polishing steel surfaces.

BRISTOL CHANNEL, an inlet of the Atlantic ocean, in the s.w. of England, between South Wales on the n., and Devon and Somerset shires on the s.; or it may be regarded as an extension of the estuary of the river Severn. It is about 80 m. long and 5 to 48 m. broad, the greatest breadth being between St. Gowan's head and Hartland point, its most western and external points, this line passing through Lundy isle. It is the largest inlet or estuary in Britain, having a very irregular coast-line of 220 m., and receiving a drainage of 11,000 sq. miles. The chief rivers which flow into it are the Towy, Taff, Usk, Wye, Severn, Avon, Axe, Parrot, Taw, and Torridge. The tides in it rise to an extraordinary height—at Bristol, 35 ft.; at King's road, 40; and at Chepstow, sometimes 70. The rapid flow of the tides meeting the currents of the rivers produces, in the narrow parts of the channel, and in the mouths of one or two of the rivers which enter it, the phenomenon of the *bore*, the tide advancing like a wall of water sometimes 6 to 9 ft. high. The chief bays and harbors are, on the n., Caermarthen and Swansea bays, Cardiff roads, the mouths of the Usk and Wye, and the Severn estuary; and on the s., Bideford or Barnstaple, Morte, Ilfracombe, Combe Martin, Minehead, Porlock, and Bridgwater.

BRISTOW, BENJAMIN H., b. Ky., 1833; practiced law until the commencement of the civil war, when he volunteered and served in the union army, rising to col. On the organization of the department of justice by the federal government he was appointed solicitor-general, and in 1873 he was attorney-general.

BRISTOW STATION, a village in Virginia, 4 m. s.w.s. of Manassas Junction, where two engagements took place during the rebellion—one Aug. 27, 1862, closed by darkness, and indecisive; and one Oct. 14, 1863, when the Confederates, who made the attack, were repulsed.

BRIT, *Clupea minima* (Peck), a species of herring, very small, found in great abundance at certain seasons off the New England coast, where it serves as food for bluefish. It is seldom more than 3 in. long, and is of no importance for the table.

BRITAIN, GREAT. See GREAT BRITAIN.

BRITAIN, NEW. See NEW BRITAIN.

BRITANNIA (perhaps from Celtic *brith* or *brit*, painted, the ancient Britons being in the habit of painting their bodies blue with woad), the ancient name of the island of Great Britain (see BRITANNICÆ INSULÆ). The Romans under Julius Cæsar (who wished to chastise the Britons for aiding the Veneti, a tribe in Gaul, against the Roman power) invaded Britain in 53 and 54 B.C, but they did not, for a hundred years afterwards, proceed with vigor to subdue the country. After a desperate resistance by the native

British princes, especially Caractacus and Boadicea, the s. half of Britain was conquered by Vespasian, and made a Roman province in the reign of Claudius, about 50 A.D. Agricola, sent by Nero in 79 A.D., consolidated these conquests, and extended the influence of Rome to the firths of Forth and Clyde, between which, in 84 A.D., he erected a chain of forts to repel the inroads of the northern Caledonians, in the line of the stone wall of Antoninus, afterwards erected, in 140 A.D., by Lollius Urbicus. Agricola was the first Roman to sail round the island, and the first Roman general to come in contact with the Caledonians, whom, under their leader Galgacus, he overthrew, in 84 A.D., at a hill called the Mons Grampius, the situation of which has not been satisfactorily determined. The Romans made many ineffectual attempts to subdue the Caledonian barbarians, and penetrated, for this purpose, through the n.e. part of Scotland as far as the Moray firth, as is attested by the remains of Roman camps and stations still existing along their line of march, and the relics of Roman art found in connection with them. Not only did the Caledonians on their own soil resist the Roman sway, but by constant inroads into the Roman territory s. of the wall of Antoninus, they so harassed the Romans themselves, that the latter were forced to abandon their conquests for 80 m. s. of that wall, and to secure permanently their remaining conquests in South Britain by a line of defensive works between the mouth of the Tyne and the Solway firth, called the wall of Hadrian (q.v.), begun by Agricola, in 80 A.D., strengthened by Hadrian in 121, and rebuilt and completed by Severus in 210 A.D. After this last date the Romans did not attempt to regain their lost provinces. Subject to these incursions of the Caledonians, the opposition of the native British princes, and the invasion of tribes from the opposite shores of the continent, the Romans held sway in Britain down to about 420 A.D., soon after which time the Saxons invaded s. Britain, and ultimately subdued it. Britain, s. of the Solway firth and the mouth of the Tyne, in the reign of Claudius, formed one Roman province under a consular legatus and a procurator. Ptolemy mentions 17 native tribes as inhabiting this tract. Toward the close of the 4th c. A.D., Roman Britain constituted a diocese in the prefecture of Gaul, and was divided into five provinces, of which the boundaries, though uncertain, are supposed to have been as follows: B. Prima, England s. of the Thames and the Bristol channel; B. Secunda, Wales; Flavia Cesariensis, the country between the Thames, Severn, Mersey, and Humber; Maxima Cesariensis, the rest of England to the Scottish border; and Valentia—soon abandoned by the Romans—or Scotland s. of the wall of Antoninus. At this time, also, the inhabitants of Roman Britain included Phenician, Roman, and Germanic elements, which had become incorporated with the native Britons, who were of Celtic or Gaelic descent. The Romans governed Britain by a vicarius or vicegerent resident at Eboracum (York), under whom were consulars, presidents, and other subordinate officers. To insure the obedience of the natives, at least three Roman legions—chiefly composed of Gauls, Germans, Iberians, and but few pure Romans—were stationed in Britain; viz., at Eboracum, Deva (Chester), and Isca Damnoniorum (Exeter). Under the Romans, many towns (*coloniæ* and *municipia*)—56 are enumerated by Ptolemy—arose in Britain, and diffused Roman law and civilization over the country. The towns of Eboracum (York) and Verulamium (near St. Albans) had the privileges of Roman citizenship. The Romans made many roads or streets (*strata*), of which there are still numerous remains, across the country, all centering in London. They also developed it into a corn-growing country. Druidism was the religion of the Britons at their conquest by the Romans, but the latter introduced Christianity and Roman literature into the country. There are many remains still extant of the presence of the Romans in Britain, such as camps, roads, ruins of houses, baths, flues, altars, mosaic pavements, painted walls, metallic implements and ornaments, weapons, tools, utensils, pottery, coins, sculptures, bronzes, inscriptions, etc. These remains show that the Romans wished to render their British conquests permanent, and that they had greatly improved the arts of the ancient Britons, as is evident on comparing the remains with the far ruder native antiquities of the British pre-Roman or prehistoric era, such as tumuli, barrows, earth-works, so-called Druidical monoliths and circles, cromlechs, cairns, pottery, weapons, tools, utensils, ornaments, etc. Many of the Roman remains in Britain also show that the Romans had introduced into the country the refinements and luxuries of Rome itself.

Under the term BRITANNIA, Great Britain has been personified in the fine arts as a female seated on a globe or on an insulated rock, and leaning with one arm on a shield, the other hand grasping a spear or a trident. The first example of this personification is on a Roman coin of Antoninus Pius (died 161 A.D.). The figure reappears first on the copper coinage of England in the reign of Charles II. (1665); the celebrated beauty, Miss Stewart, afterwards duchess of Richmond, is said to have served as model to the engraver, Philip Roetier. The Britannia that appears on the reverse of British copper coins since 1825 was the design of Mr. W. Wyon. See COINAGE.

BRITANNIA METAL, is an alloy very largely employed in the construction of the cheaper kinds of tea and coffee pots, tea-spoons, etc. The proportions of the metals used in its manufacture are various, but the average composition in 100 parts is: tin, 85½; antimony, 10½; zinc, 3; and copper, 1. B. M. is harder than pewter (q.v.), hence vessels or spoons made of it are not so liable to lose their shape, or to be indented with a slight blow. A variety of B. M., called *queen's metal*, is also extensively used for

similar purposes, and it ranks intermediate in hardness between pewter and ordinary B. M. Queen's metal is composed of—tin, 9; antimony, 1; bismuth, 1; and lead, 1.

BRITANNIA METAL. The present composition of britannia metal at Birmingham is usually 90 tin + 8 antimony + 2 copper, without any zinc or bismuth; although some manufacturers deviate a little from this formula, by adding one or both of the metals last named. The manufacture was begun at Sheffield by Hancock and Jessop, in 1770; it reached Birmingham towards the close of the century, and made gradual progress. At first, the articles were made by stamping with dies, and soldering up into form; this being a slow operation, rendered the articles expensive. Afterwards, the curious process of *metal spinning* was introduced; and this, with the subsidiary operation of swagging, rendered a great reduction in price possible. In the spinning process, a thin sheet or piece of britannia metal is placed upon a wooden model shaped like the article to be made; the model is made to rotate in a lathe; and burnishers and other tools are employed to press the yielding metal into all the curvatures of the model. Ductility is an essential quality to the attainment of this end with the metal; how complete it is, may be seen in such articles as britannia metal teapots and dish-covers, the principal forms of which are not given by hammering, stamping, or casting, but by spinning. Besides spinning and swagging, the processes include stamping, soldering, casting, and polishing. When electro-plating was introduced, an increased use of britannia metal arose, as it forms a good ground or basis for the deposited silver. Britannia metal spoons and ladles, made by casting, stamping, and burnishing, have been nearly driven out of the market by German silver; but the former metal is more largely used than ever for hot-water jugs, soup tureens, gravy-dishes, vegetable and side dishes, dram bottles, drinking-cups, sandwich cases, wine-coolers, soap-boxes, liquor-frames, cruet, waiters, trays, etc.; and as a basis for electro-plate. Birmingham is the chief seat of the manufacture.

BRITANNIA TUBULAR BRIDGE, a railway bridge over the Menai strait, remarkable alike for its gigantic dimensions, and as being the first construction of the kind ever undertaken. With a view to facilitate communication with Ireland *via* Holyhead, the directors of the Chester and Holyhead railway in 1845 sought the aid of Mr. Robert Stephenson, the great engineer, to bridge the strait with such a structure as should admit of the safe passage of heavily laden trains without in any way interfering with the navigation of the channel. About a mile above the suspension-bridge, and nearer Carnarvon, a rock in the middle of the strait rose 10 ft. above the water at low tide; and on this site, provided by nature, it was resolved to erect a bridge in the form of a rectangular tube, composed of wrought-iron plates riveted together in a manner to combine the greatest strength with the greatest lightness. See STRENGTH OF MATERIALS AND TUBULAR BRIDGES. In the spring of 1846, the undertaking was commenced; by the 22d of June, 1849, the Britannia tower on the rock in the center of the strait was completed (height, 191 ft. 6 in. above high-water mark). Other two towers, some 18 ft. lower, were erected on each side of the Britannia tower; thus dividing the space into four spans, of which the two center ones are 460 ft. each, the other two being comparatively narrow. The short tubes between the abutments and the short towers were constructed, by means of strong scaffolding and stages, in the places they were to occupy when finished; the long central tubes were built at the water-edge, from whence they were floated off on pontoons to the base of the towers, which had grooves or recesses made to receive them, and then elevated gradually (supports being built under their ends as they ascended) by powerful hydraulic presses to the requisite height, 102 ft. above high-water mark. On the 13th of Oct., 1849, the first long tube, 472 ft. in length (12 ft. being allowed for the rest at both ends), and about 1800 tons in weight, was safely fixed at its proper height above the sea. The other center tube was got up by Dec.; and on the 5th of Mar., 1850, a train swept through, and the bridge was open for traffic. In Aug. the parallel line of tubes was completed, and the up and down trains could now pass over the Menai with as little delay and danger as over any other part of the line. The total length of the bridge is 1841 ft., of the tubes, 1513 feet. The extreme height of the tube at the Britannia tower is 30 ft., diminishing to 22 ft. 9 in. at the abutments, "the difference being made to give a true parabolic curve to the top while the bottom is straight." Inside, the width is 13 ft. 8 in. throughout, and the height 26 ft. at the middle, and 18 ft. 9 in. at the ends. To provide for the expansion and contraction of the metal, the bed-plates in the shore towers and in the abutments, on which the tubes rest, are made to move freely on cast-iron rollers and balls. This precaution, for securing free movement to the tubes, was not unnecessary, as it has been found that between the expansion of summer and contraction of winter there is a difference of fully 12 inches. The total weight of iron used was nearly 12,000 tons, of which the tubes contain 9360 tons of malleable iron, 1015 tons of cast iron, and 175 of permanent railway. In their fabrication 186,000 different pieces of iron, fastened together by more than 2,000,000 rivets, were used; and in the towers, abutments, etc., there is 1,492,151 cubic feet of masonry. The total cost was about £602,000. The whole structure was completed in less than five years. See TUBULAR BRIDGE.

BRITANNICÆ INSULÆ, a term used by ancient classic writers previous to Cæsar for the British isles, including Albion (England and Scotland), and Hibernia or Ierne (Ireland), with the smaller isles around them. Aristotle, in the beginning of the 3d c. B.C., knew only of Albion and Ierne. Cæsar, about 54 B.C., was the first to apply the name Britannia to Albion. Ptolemy, in the 2d c. A.D., is the first to apply Little Britain to Ierne or Ireland, and Great Britain to Albion or England and Scotland. Herodotus, in the 5th c. B.C., is the first writer to mention Britain with any sort of definiteness; previous Greek writers speak of Britain only in connection with the Phœnician tin trade carried on with the Cassiterides or Tin isles (the Scilly isles and Cornwall), which they often confound with the Azores. The Phœnician trade with the British isles began about 1000 B.C., the Phœnicians giving the native Britons salt, skins, and bronze vessels in exchange for tin and lead. Ptolemy enumerates 52 different Celtic or Gaelic tribes as inhabiting Britain in his time. See **CÉLTIC NATIONS**.

BRITANNICUS, son of the emperor Claudius by Messalina, b. 42 A.D. He was the natural successor to Claudius, but after his mother's execution (when B. was eight years old), Agrippina, the new wife, persuaded Claudius to pass by B. and adopt her son by previous marriage with Lucius Domitius. This son was the emperor Nero; and soon after his accession, Pallas, one of Agrippina's lovers, who had been banished, threatened a revolt, and roused Nero's fear that B. might displace him; so B. was poisoned and died on his fourteenth birthday.

BRITISH AMERICA. See **AMERICA**, **BRITISH**, *ante*.

BRITISH ARMY. In **ARMIES**, **MODERN**, a succinct account is given of the relative strength and organization of the chief European armies, with the exception of that of the British empire, reserved for consideration in the present article.

Like other modern armies, the British army originated in the feudal system (q.v.). When regal power, tempered by a parliament, superseded that system, the people, according to their rank in life, were expected to provide themselves with certain kinds of weapons and defensive armor. The justices of the peace were empowered to see to these military duties of the people. When the nation was either actually engaged in war, or apprehensive of invasion, the sovereign issued commissions to experienced officers, authorizing them to draw out and array the fittest men for service in each county, and to march them to the sea-coast, or to any part of the country known to be in most danger. See **ARRAYER**. It was in the time of Henry VIII. that lord-lieutenants and deputy-lieutenants of counties were first appointed as standing-officers for assembling and mustering the military force. During the earlier years of the Tudors, contracts were made by the king with "captains," who undertook to provide, clothe, and feed so many fighting-men, for a given money-allowance; but the power intrusted to the lord-lieutenants gradually changed this system, in relation at least to home-defense. In the reign of Charles I., the important question arose, whether the king of England did or did not possess the right to maintain a military force without the express consent of parliament? and this question was all the more bitterly discussed when the king billeted his soldiers on the people. After the troubles of the civil wars and the commonwealth, Charles II. found himself compelled to agree, on his restoration, to the abandonment of all the army except a kind of body-guard or household brigade of 5000 men, sanctioned by the parliament. In the 13th year of his reign, he succeeded in obtaining a statute, declaratory that "the sole and supreme power, government, command, and disposition of the militia, and of all forces by sea and land, and of all forts and places of strength, is the undoubted right of his majesty; and both or either of the houses of parliament cannot nor ought to pretend to the same." Both Charles II. and James II. found, however, to their mortification, that this statute did not in effect give them so much real military command as they had wished and intended—because the commons, by holding the purse, virtually held the power.

It was in the time of William and Mary that the real basis for the modern B. A. was laid. The declaration of rights (q.v.) settled, in positive terms, "that the raising and keeping of a standing army in time of peace, without consent of parliament, is contrary to law." The first mutiny act (q.v.) was passed in 1689, to last for six months only; but it has been annually renewed ever since, except in three particular years; and it constitutes the warrant on which the whole military system of England is exercised by the sovereign, with the consent of parliament. Since then, with only three interruptions, the ministers of the crown have annually applied to parliament for permission to raise a military force, and for money to defray the expenses. The sovereign can make war, and can bestow military employments and honors; but the commons, as the representatives of the tax-paying nation, provide a check on the grasping by courtiers of military privileges. The law on army regulation has been revised, and the B. A. made the subject of special legislation in the army discipline bill passed in 1879.

The great distinction between the B. A. and that of almost every other state in Europe, is that the service is *voluntary*. The subjects of the crown engage, by free choice, to serve in the army for a definite number of years. In the rare cases where forced service by ballot is obtained, it is in the militia, not the regular army. See **MILITIA**. The British soldier has much hard colonial life to bear, and many long voyages to make; he is, moreover, almost entirely shut out from the chance of being a commis-

sioned officer. As a consequence, the ranks are mostly filled from the more necessitous classes of the community—by those who from want of steady habits, or of education, are the least fitted for industrious pursuits; whereas in France and many other foreign countries, the profession of arms is regarded as an honorable one, of which even the private soldier feels proud. Mr. De Foublanque, comparing the peace establishments of the chief European armies in 1857, found that of England to be the smallest in ratio to population, but the most costly in relation to its strength. The English ratio was 1 in 128; the French, 1 in 95; the Prussian, 1 in 80; the Russian, 1 in 72; the Austrian, 1 in 68. An English private soldier costs the country £52 per annum; French, £26; Prussian, £31; Austrian, £18 10s.; Russian, £13 5s. The English cost per man is still higher now than it was in 1857, on account of increased attention being paid to the well-being of the soldier.

The B. A., in all its completeness, is supposed to be commanded by the sovereign, assisted by the secretary of state for war in some matters, and by the officer commanding in chief in others. The component elements are the household troops; the infantry of the line; the cavalry of the line; the ordnance corps, comprising artillery and engineers; other bodies of native troops, maintained out of the revenues of India; the militia; the yeomanry cavalry; the reserve; the volunteer artillery and rifles; and sometimes during war, foreign legions. The "peace establishment" of the B. A. varies according to the political aspect of affairs abroad, and to the strength of the economizing principle at home. In 1814, when England was engaged in tremendous contests abroad, the regular army reached 200,000 men, exclusive of fencibles, foreign legions, and militia. In the first few years after the termination of the great war against Napoleon, the reductions in the B. A. involved the compulsory retirement of no less than 10,000 military officers, who thereupon went on half-pay; these, by filling vacancies, transfers, and deaths, have nearly disappeared. The elasticity which permits the enlargement or contraction of the army arises from varying, not so much the number of regiments, as the number of battalions in a regiment, of companies in a battalion, or of men in a company. If we compare the strength of the regular army at various periods between 1820 and 1879, we shall find that the actual number of regiments has varied but little, the difference of strength being made up in the three modes just mentioned.

The strength of the B. A. declined from 1815 to 1835, since which last-mentioned year it has increased. These augmentations have been occasioned partly by the contests in China, India, Kaffraria, Persia, the Crimea, Afghanistan, and Zululand, and partly by a sense of insecurity amid the vast armaments of the continent. In comparing the strength of the forces at different periods, much confusion is apt to arise from different modes of interpreting the words "British army." This designation may include the whole of the royal troops in India, whether supported out of imperial or of Indian revenues; it may include the militia, the volunteers, the yeomanry cavalry, the foreign legions—or it may exclude any one or more of these. The "British army," and the "military force of the British empire," are often treated as convertible terms: to the production of much confusion where actual numbers are given. In the following table, relating to the official year 1879–80, it is shown of what component elements the B. A. now consists. The militia and the volunteer corps are not here included.

BRITISH ARMY VOTED FOR 1879–80.

	Home and colonies.	India.	Total British army.
Horse artillery.....	3,131	2,478	= 5,609
Cavalry, including household cavalry.....	12,907	4,312	= 17,219
Artillery.....	19,225	9,667	= 28,892
Engineers.....	5,198	428	= 5,626
Infantry, including foot guards.....	76,366	45,768	= 122,134
Service corps.....	2,990	..	= 2,990
Colonial corps.....	2,485	..	= 2,485
Army hospital corps.....	1,745	..	= 1,745
Additional force in consequence of reinforcements to Natal.....	3,900	..	= 3,900
	<hr/> 127,947	<hr/> 62,653	<hr/> 190,600

Under the column "India," are included only those troops of the royal army which are lent to India, and paid for out of Indian revenues; the other military forces in that region are enumerated under EAST INDIA ARMY. Of the total 190,600 forming her majesty's forces, 7980 are officers; 16,550 non-commissioned officers, drummers, and trumpeters; and 166,070 rank and file. There are voted for the use of this army, 11,325 horses. The total cost cannot well be estimated per head; because, besides pay and sustenance for the soldiers, there are stores and wages for fortifications and military buildings, military weapons and combustibles, and the various kinds of half-pay and pensions. The total expenditure sanctioned by parliament may, however, conveniently be thrown under four headings, and given in round numbers as follows:

Pay and allowance of combatants.....	£4,944,200
Auxiliary and reserve forces.....	1,258,500
Stores and works of every kind.....	6,817,200
Pensions, militia, volunteers, etc.....	2,625,800
	<hr/>
	£15,645,700

—being the charge for a *peace* establishment, in which to admit of expansion for actual war, the upper ranks (which cannot be summarily created) are disproportionately large. For the sum taken in aid of the army estimates to meet the expenses for raising and training the recruits, and for the non-effective services of the European army serving in India, a separate estimate was presented (1879–80), amounting to £1,100,000.

All the component elements of the army, in *personnel* and *matériel*, and the organization and duties of the troops, will be found noticed under their proper headings. The total military strength of the United Kingdom—including all the various kinds of force, also India and the colonies—comprised the following in 1879:

Regulars (including India and the colonies).....	190,600
Army reserve, 1st class.....	22,000
“ “ “ 2d “	24,000
Militia (including permanent staff and militia reserve).....	137,556
Yeomanry cavalry.....	14,614
Volunteers (including staff).....	244,263
	<hr/>
	633,033

BRITISH ASSOCIATION, an association whose object is, by bringing together men eminent in all the several departments of science, to assist the progress of discovery, and to extend over the whole country the latest results of scientific research. A prevailing impression that England had fallen behind other countries, both as to the general estimation in which scientific men were held, and the prosecution of science itself, led to its formation. It was thought that an imposing union of men of science with the nobility, gentry, and clergy might tend to revive the philosophic spirit of the country. Such meetings had already taken place in Germany, and probably suggested the idea of this institution. Many leading men of the age took part in its formation, but the honor of being its founder must be ascribed to sir David Brewster. By his exertions the first meeting of those who were favorable to the design was held at York in the year 1831. The archbishop of York, the mayor and council of the city, entered warmly into the project. At this meeting the constitution of the society was determined, the several sections had their provinces assigned to them, and subjects were proposed on which reports were to be drawn up and read at the ensuing meeting. This took place at Oxford in 1832. The university had cordially welcomed the new association, the papers which were read gave it at once the high character it has since sustained, and from this date it may be said to have been in complete and successful operation. An enumeration of the several sections of the society, each of which has its own committee and president, will show the wide range of topics it embraces: Section A., mathematical and physical science; B., chemistry; C., geology; D., zoology and botany, including physiology; E., geography and ethnology; F., economic science and statistics; G., mechanical science.

At the close of each meeting, it is determined at what town in the United Kingdom the next shall be held, and a president of the whole association is appointed, who delivers an inaugural address, in which he is expected to present a general survey of the latest advances of science. The rules and by-laws of the society it is not necessary here to particularize; but it should be mentioned that the subscriptions of a continually increasing membership have placed at its disposal a large fund, which has been expended in the prosecution of science. In many cases, as in long astronomical calculations, or extensive meteorological observations, the labor of subordinates is required, and a certain apparatus, and it is in defraying such expenses that the funds of the B. A. are very wisely employed.

Besides the immediate ends sought to be obtained by such an association, its utility will be evident if we reflect on the intimate connection that exists between the several branches of science, and the impossibility there is that any one mind can be thoroughly conversant with them all. He who now hopes to make discoveries in science must limit himself to a few chosen studies; and yet such is the interlacing of all the several branches of inquiry, that he must often find it indispensable to know the last results of each. The botanist or the physiologist must consult the accomplished chemist; the chemist must call in the aid of those who have specifically studied the action of heat, light, and electricity; the geologist needs them all, and is in turn consulted by all. Thus, a certain brotherhood of science is formed, in which each has his speciality, and yet each leans upon his brother.

In ancient times it was otherwise. The facts on which a philosopher speculated were those which lay open to the eyes of all. A Thales could see the rain fall and plants grow, and forthwith pronounced that the vital energy of all things was to be found in

water. He could exercise his imagination in perfect independence of the labor of all other men. The philosopher of modern times cannot move a step without a careful consideration of the theories of his predecessors and contemporaries; he has to take notice of the innumerable facts brought to light by various observers, aided by those artificial arrangements which convert observation into experiment.

Two classes of men, of the most opposite character, are greatly aided by an association such as this. The humble and plodding workmen are taught where their patient industry will most avail; they are cautioned against re-discoveries; they are told where their love of collecting or experimentalizing may be best applied. And that other class of men, who love to generalize, who ever seek to embrace all the multifarious facts of science under a few great laws—these are provided with the very last intelligence from every department of inquiry, and may forthwith proceed to weave it into their own comprehensive scheme. Nor are we to overlook the benefit which the whole community derives from the rapid dissemination of the latest results or speculations of philosophy. Not only do our idle and fashionable, as well as our manufacturing towns and our universities, welcome the meetings of the B. A., but from this *Parliament of Science* the utterance of scientific opinion goes forth over the whole kingdom through the agency of the press. Within three days after one of its meetings, there is not a workshop or a tea-table in the country that has not derived from it a new topic of conversation. This kindling of an interest in science, through the whole population, we regard as amongst the greatest advantages of the British association.

BRITISH BURMAH. See BURMAH, BRITISH, *ante*.

BRITISH COLUMBIA. See COLUMBIA, BRITISH, *ante*.

BRITISH EMPIRE. See GREAT BRITAIN and IRELAND.

BRITISH GUM, DEXTRINE, or LEUCOME, is a substance extensively employed by calico-printers and others for the thickening of colors, instead of the much more expensive gum arabic. It is prepared from potato-starch (q. v.) or sago-starch by passing the grains through iron cylinders at a temperature about 500° F. It differs from starch in giving no blue color with tincture of iodine, and in being readily soluble in water, and thus yielding a thick liquid resembling in consistence mucilage (strong solution of ordinary gum). B. G. is the material which is produced by baking in the crusts of loaf-bread (q. v.) and which communicates to them their very agreeable taste.

BRITISH MUSEUM. The British Museum, an important national institution in London, originated in a bequest of sir Hans Sloane, who, during a long lifetime, gathered an extensive and, at the time, unequalled collection of objects of natural history and works of art, besides a considerable library of books and manuscripts. These, in terms of his will, were offered, in 1753, to the government, on condition that £20,000 should be paid to his family, the first cost of the whole having amounted to more than £50,000. The offer was accepted; the necessary funds were raised by a lottery! and the collection, along with the Harleian and Cottonian libraries, were arranged in Montague house, which had been purchased for £10,250. The new institution, thenceforth called the British Museum, was opened in 1759. From time to time, purchases and donations succeeded each other rapidly. Montague house sufficed for the reception of all these acquisitions, till the Egyptian antiquities arrived in 1801. The purchase of the Townley marbles, in 1805, necessitated the erection of a gallery for their reception. This, however, did not meet the increasing demand for space. The old house was condemned, and plans were prepared by sir R. Smirke for new buildings; but none were undertaken till 1823, when the eastern wing of the present building was erected for the reception of the library of George III., which had been presented to the museum by George IV. The subsequent progress of the works was very slow. The building was completed in 1847. It is a hollow square, whose sides are opposite to the four points of the compass. Throughout the exterior of the building, the Grecian Ionic is the order of architecture adopted. The principal front is towards the s., facing Great Russel street, and presents an imposing columnar façade, 370 ft. in length. The great entrance-portico, in the center, is composed of a double range of columns, 8 in each range. The columns are 5 ft. in diameter at their base, and 45 ft. in height. The tympanum of the portico is ornamented with an allegorical sculpture by Westmacott, typical of the progress of civilization. On either side of the museum, there is a semi-detached house, containing the residences of the chief officers of the establishment. These give an additional length of 200 ft., making the whole length of the structure 570 feet. The interior of the building is admirably adapted to the purposes for which it is devoted. Some of the galleries, from their size and dimensions, have a very imposing appearance, as the king's library, the bird gallery, etc. The grand entrance-hall is a noble and lofty apartment, built in the massive Doric style; it contains a statue of sir Joseph Banks by Chantrey, and an ideal representation of Shakespeare by Roubilliac.

Scarcely had Smirke's plans been carried out, when demands were made from several of the departments for more accommodation. Additions have accordingly been made, rooms having been provided for the print department, and several new galleries for the recent acquisitions of antiquities; but the most important addition is the mag-

nificent reading-room which has been erected in the internal quadrangle. In no department of the museum was additional accommodation more needed than in the library. The number of readers had increased beyond the means of accommodation, and so short of space were they for books, that the estimates for purchases were restricted to only the half of the sum which the trustees considered desirable, for the sole reason that the library would be inadequate for the reception of extensive additions. After considerable delay, and the consideration and rejection of several plans, nothing was done till Mr. Panizzi, at that time keeper of the printed book department, suggested a plan which promised to meet the important requirements of speedy erection and economy in cost. The plan was at length adopted, and the result is a building than which none are better, few perhaps so thoroughly adapted to the purposes for which it is intended. Parliament voted the first grant for it in 1854. It was opened in 1857. The total cost was about £150,000, which includes the fittings and furniture, and the necessary shelves for immediate use. The building was erected in the interior quadrangle, which it completely occupies, with the exception of an interval of about 28 ft. all round, necessary for lighting and ventilating the surrounding building. The reading-room is circular. It is constructed principally of iron, with brick arches between the main ribs. The dome is 106 ft. in height, and its diameter 140 ft., being second only to the pantheon of Rome, and that but by 2 feet. The use of iron has economized the space to an extraordinary degree, for while the piers which support the pantheon fill 7477 ft., those on which the reading-room rests occupy only 200 feet. Equally remarkable has been the saving of space in the fitting up of the library. The shelves are formed of galvanized iron plates, edged with wainscot, and covered with leather, and are supported on malleable iron standards. In all the cases except against the external walls, the bookcases are double, a lattice of ironwork being fixed for the longitudinal separation of the books. Thus, throughout the whole interior of the new building, walls are dispensed with, the divisions being in all cases formed of the double ranges of books. The building contains 3 m. lineal of bookcases 8 ft. high. Assuming them all to be spaced for the average octavo book size, the entire ranges form 25 m. of book-shelves, and would accommodate 1,000,000 such volumes. In addition to this, the dome-room, which is the reading-room, has accommodation for 60,000 volumes. This magnificent room contains ample and comfortable accommodation for 300 readers. Each person has a space of 4 ft. 3 in. long. He is screened from the opposite occupant by a longitudinal division, which is fitted with a hinged desk, graduated on sloping racks, and a folding-shelf for spare books. In a recess between the two are placed an inkstand and penholders, thus leaving the table unincumbered. By an ingenious contrivance, one part of the iron framework is made to distribute fresh air in the summer and heated air in the winter. The vitiated air is conveyed through apertures in the soffits of the window, into one of two separate spherical and concentric chambers which extend over the whole surface of the roof, and escapes through outlets around the lantern. The other chamber, between the external covering of copper and the brick vaulting, has for its object the equalization of temperature, during extremes of heat and cold out of doors. Every modern improvement, in short, has been applied, when it could be serviceable, for the comfort or convenience of the readers. Much praise is due to the architect and builder, but a larger share is owing to the late sir A. Panizzi, who not only supplied the original design, but daily, almost hourly, superintended the progress of the work, continually suggesting little improvements, and in the end producing a room which is admired by all especially those who daily use it.

This building, while supplying amply the demands of the printed book department, did nothing, to meet the requirements of the other departments. Various schemes have been suggested; the best, and perhaps in the end the cheapest, of securing the ground immediately around the museum, has been given up, and the trustees resolved to erect a building to be devoted entirely to natural history—that is to say, to the departments of botany, zoology, geology, and mineralogy—on the site occupied by the international exhibition of 1862. Parliament voted in the year 1873, £80,000 for this purpose, and a beginning was made by the contractor. The whole cost of the new building very nearly reached the sum of £400,000. This elegant new terra-cotta building, situated in the Cromwell road, near South Kensington museum, was designed by Mr. Alfred Waterhouse.

Contents.—At first, the contents of the muŕum were arranged under three departments—printed books, manuscripts, and objects of natural history. Under the last head were included the antiquities, works of art, etc., comprised in the Sloane collection, their number being too scanty to entitle them to constitute a separate department. The progress of the museum has caused a more precise division of its contents. From time to time, the number of the departments has been increased, so that, instead of three, there are now twelve—viz.: printed books, maps, manuscripts, prints and drawings, oriental antiquities, Greek and Roman antiquities, coins and medals, and British and mediæval antiquities and ethnography, zoology, botany, geology, and mineralogy. In noticing the contents of the museum, we shall refer to them in this order. We can but allude here to the most important portions of the collection, and must refer for more particular information to works specially devoted to this subject; such as the various handbooks and catalogues prepared by the officers of the museum.

Printed Books.—This is the largest department in the museum. It occupies the whole of the ground floor on the n. and e. sides, the new building erected in the quadrangle, and a considerable portion of the basement of the museum. The keeper of the department has the help of 3 assistant-keepers and 43 assistants. There are in addition 54 attendants.

The original bequest of sir Hans Sloane consisted of 50,000 volumes. When these were placed in Montague house, a small collection of 2000 volumes, bequeathed to the nation by maj. Edwards in 1738, was added to them. In 1757, George II. presented the library of printed books which had been collected by the kings of England since Henry VII., and which included the libraries of Cranmer and Casaubon. He also annexed the important privilege, which the royal library acquired in the reign of queen Anne, of being supplied with a copy of every publication entered at Stationers' hall. By this means the library has been supplied with the current British literature without expense or trouble, and the trustees have been able to devote the funds of the museum to the purchase of the earlier literature of the country and foreign publications. Among subsequent additions to the library may be mentioned the voluminous collection of pamphlets, etc., relating to the civil wars of England between 1640 and 1660, presented by George III.; the musical libraries of sir J. Hawkins and Dr. C. Burney; Garrick's collection of old English plays; Dr. Bentley's collection of the classics, annotated by his own hand; the law library of F. Hargrave; sir J. Banks's valuable and extensive collection on natural history; and a large mass of tracts and pamphlets relating to the French revolution, purchased from J. Wilson Croker, and of very great value. The most important addition was made in 1823, when George IV. presented the splendid library that had been collected by his father during his long reign, at an expense of little less than £200,000. This library, which, from the terms of the gift, cannot be mixed with the general collection, occupies a large and handsome hall, extending along the whole of the ground floor of the eastern side of the museum. It is undoubtedly the finest and most complete library ever formed by a single individual. "It contains," says sir H. Ellis, "selections of the rarest kind, more especially works of the first ages of printing; it is rich in the early editions of the classics; in books from the press of Caxton; in the history of the states of Europe; in the languages of the respective countries; in the transactions of academies; and in a grand geographical collection." The magnificent library of the right hon. Thomas Grenville, in importance second only to the king's library, was bequeathed to the museum in 1846. It consists of 20,240 volumes, which cost upwards of £54,000. In the same year was obtained also the extensive collection of Chinese works, amounting to 11,509 volumes, which belonged to Robert Morrison. By purchases, bequests, and donations, the library has become one of the first in the world, containing now over 1,300,000 printed volumes. See LIBRARIES. But even this figure, large though it is, does not represent the immense collection of separate and distinct articles in tracts, pamphlets, and manuscripts. The British museum library is (with the exception, perhaps, of the national library of Paris) the largest collection of printed literature in the world. Since the opening of the new reading-room, and the consequent acquisition of the book accommodation, the want of which long hindered the proper increase of the library, the rate of increase has been enormous. During the year 1872, there were added 29,853 volumes, including music and volumes of newspapers, of which 1354 were presented, 19,801 purchased, 8345 acquired by home copyright, and 353 by international copyright. The number of parts of volumes was 30,554. In addition, the library had accumulated numerous broadsides, and miscellaneous articles variously obtained. The numbers of the pieces of music alone added were 4644 complete works, besides 1790 parts and numbers of works in progress. The total number of articles received during the year amounted to 66,278. In 1874, 37,000 volumes were received.

A catalogue of the printed books, in 7 octavo volumes, was published in 1813-19. So great have been the additions to the collection since the publication of that catalogue, that the interleaved copy of it, in which the new entries were made, had expanded in 1846 into 83 folio volumes. This is now superseded by one general MS. catalogue, contained in upwards of 1600 folio volumes. There are separate catalogues of the Grenville library, in 6 volumes; of music, in 126 volumes; of newspapers, in 4 volumes; of the pamphlets in the king's library, in 9 volumes; and of the pamphlets published during the civil war and commonwealth, called the "Thomason collection," in 12 volumes, all folio. These various catalogues are placed in the central circular stands in the reading-room, for consultation by readers. Here also are copies of the catalogue of the books of reference, arranged around the wall of the room, to which the readers have free access without the intervention of an official. These books, forming a library of 20,000 volumes, have been carefully selected to represent all the different branches of knowledge. The facility of consultation has been increased by the employment of different colors in the binding, corresponding to the colors of a hand catalogue scattered throughout the room. Thus theological works are bound in blue, historical in red, philosophical in green, and so on.

The right of access to the library is easily obtained. Any person desiring it, is "to apply in writing, addressed 'To the principal librarian of the British museum,' and not otherwise, specifying his description and place of abode, and accompanying his letter with a written recommendation, satisfactory to an officer of the museum." Formerly,

the right of admission was granted only for six months at a time, and had then to be renewed. Under the new regulations, the ticket, once granted, does not require renewal; it can, of course, be withdrawn, and is not granted to persons under 21 years of age. When the reader has become well known to the officials, he is not even asked to show his ticket.

Maps.—The maps, charts, plans, and topographical drawings were separated from the library, to form a distinct department, in 1867. There are over 50,000 published and 20,000 manuscript maps in the museum. Many of the latter have thrown much light on the history of early geographical discovery.

Manuscripts.—The manuscripts are contained in several rooms in the s.e. angle of the building. The work of the department is carried on by a keeper, assistant-keeper, a keeper of oriental manuscripts, and nine assistants. The manuscripts are for the most part bound in volumes, and placed in cases around the rooms. The collection consists of: 1. The Sloanean manuscripts, relating chiefly to medical and natural history subjects. 2. The Cottonian manuscripts, rich in documents referring to the history of Britain, including two of the originals of *Magna Charta*, in registers of English monasteries, and in original letters of royal and illustrious personages. This collection contains the *Durham Book*—a copy of the Latin Gospels, with an interlineary Saxon gloss, finished in the year 720. 3. The Harleian manuscripts, a collection rich in illuminated manuscripts, in ancient, civil, and ecclesiastical records, in manuscripts of the classics, among which is one of the earliest known copies of the *Odyssey*, and in early English poetry. 4. The manuscripts of the ancient royal library. These were collected by our kings, from Richard II. to George II.; many of them were obtained from the monasteries, on their destruction. Amongst the most valuable treasures here are the *Codex Alexandrinus*, a manuscript of the Bible written in uncial Greek, before the close of the 5th c.; and the *Basilicon Doron* of James I., in his own handwriting. 5. The Lansdowne manuscripts. This collection comprises the Burghley and Cæsar papers, the manuscripts of bishop Kennett, and numerous valuable historical documents and state papers. 6. The Hargrave manuscripts, almost exclusively connected with law. 7. The Burney manuscripts, containing a large collection of the Greek and Latin classics. Among them is a copy of the *Iliad*, answering that of the *Odyssey* in the Harleian collection. 8. The Howard-Arundel manuscripts, obtained from the royal society. This collection is singularly rich in materials for the history of our own country and language. 9. The Oriental manuscripts, a collection composed of several purchases and bequests. It includes the manuscripts acquired by Mr. Rich while consul at Bagdad, and consists of numerous Syriac, Arabic, Ethiopic, and other oriental codices. A large series of Ethiopic manuscripts was obtained at Magdala, on the occasion of the Abyssinian war. 10. Additional manuscripts. This collection consists of innumerable bequests, donations, and purchases, which from the establishment of the museum have been and are still being acquired. Among recent additions may be specified a charter of William the Conqueror; the original mortgage-deed of a house in Blackfriars, dated 11th Mar., 1612, and signed by William Shakespeare; the holograph manuscript of Scott's *Kenilworth*, and of many of Burns's poems, including the *Cotter's Saturday Night*, and the songs published in Johnson's *Scots Musical Museum*; an extensive series of papal bulls; several *Books of Hours*, including the famous *Bedford Missal*; and a large collection of original letters and papers relating to the affairs of Scotland during the 16th and 17th centuries. Catalogues of the complete collections have at different times been published. The additions to the ever-increasing oriental and additional collections are at intervals published in supplements to each of the original catalogues. Copies of all these, with manuscript lists of the annual additions, are placed in the reading-room for consultation.

Supplementary catalogues were printed up till 1853; since then the additions have been kept up in manuscript catalogues. A general class catalogue, embracing all the collections, has been commenced, and the printing of it has begun. The first part is a catalogue of ancient and illuminated manuscripts, illustrated with photographic *fac-similes*, of which several volumes are published.

The right of using the reading-room includes the privilege of consulting the manuscripts. During 1872, the number of deliveries of manuscripts to readers in the reading-room amounted to 21,709. To artists and others in the rooms of the department, 1751 deliveries were made. These numbers do not include the volumes exhibited to visitors on private days.

Prints and Drawings.—The collections of this department, managed by a keeper and two assistants, are kept in rooms in the n.w. angle of the building. They consist of prints and drawings bequeathed to the museum, in 1799, by the Rev. C. M. Cracherode; of those bequeathed in 1824 by Mr. Payne Knight; and of numerous smaller bequests and donations. No purchases were made for this department until about 1840, when a sum was first included in the estimates for this purpose. Since that time, the prints and drawings have been increasing at a rate equal to any of the other departments of the museum. The collection is arranged in *schools*. 1. The Italian school, containing original drawings by Leonardo da Vinci, Raphael, Correggio, Tintoretto, Paul Veronese, Michael Angelo, Guido Reni, Salvator Rosa, and others. 2. The German school, containing drawings by Albert Dürer, Hans Holbein, Dietrich, Hollar, and others; and

engravings by Lucas Cranach, Martin Schon, Gauer, and others. 3. The Dutch school, containing several superb originals of Rubens, an extensive and nearly complete set of the works of Rembrandt, with many drawings by A. Cuyp, Teniers, Van Dyck, etc.; and engravings and etchings by Berghem, Lucas van Leyden, Rembrandt, Ostade, etc. 4. The French school, with drawings by Watteau, Claude Lorraine, etc., and etchings and engravings by Bourdon, Boisseaux, Le Prince, etc. 5. The Spanish school, represented by some drawings of Murillo, and others of less note. And, 6. The English school, containing drawings by R. Wilson, Wilkie, Stothard, Callcott, Gibson, etc.; a splendid collection of Hogarth's prints, and specimens of the works of Barlow, Gaywood, Raimbach, Finden, Worlidge, Geikie, etc.

This department contains also an extensive and very valuable collection of works in niello; a beautiful silver cup, designed and carved by Benvenuto Cellini, and a wonderful stone-carving in alto-relievo by Albert Dürer, representing the birth of St. John.

Oriental Antiquities.—Within the last ten years the objects in the museum, included under the name antiquities, have been divided into four departments. The first of them includes the Egyptian and Assyrian antiquities. The Egyptian monuments date from a period as remote as 2000 years before the Christian era, and come down to the Mohammedan invasion of Egypt, 640 A.D. The collection has been obtained chiefly from these sources: the antiquities which fell into the hands of the British army at the capitulation of Alexandria, presented by George III.; presents from gen. Vyse, the duke of Northumberland, the marquis of Northampton, sir Gardner Wilkinson, and others; and acquisitions from the earl of Belmore, Mr. Salt, and M. Anastasie. The sculptures are formed of granite and basalt; they represent human and allegorical figures, sometimes of colossal size. There are several beautifully sculptured sarcophagi. Most of the monuments are inscribed with hieroglyphics (q.v.). The key to this dead and forgotten language was furnished by the celebrated Rosetta Stone (q.v.), which is placed in the center of the gallery. The smaller Egyptian remains are exhibited in a gallery on the upper floor; they consist of objects relating to religion, as representations of divinities and sacred animals, in wood, metal, stone, and porcelain; of objects relating to civil and domestic life, as dress, personal ornaments, household furniture, artistic and writing implements, armor, and weapons of war, etc.; and of objects relating to death and burial, as mummies and coffins, with the scarabei, amulets, and other ornaments found with them. A collection of papyri is exhibited on the n.w. staircase, containing extracts from the ritual of the dead.

The Assyrian antiquities are contained in a suite of rooms recently erected on the outside of the Egyptian gallery, and in a spacious room on the basement. The collection consists of sculptures excavated at Nimrud, Khorsabad, and Koyunjik by Layard, in 1847-50, and more recently by Rassam and Loftus, under the direction of sir H. C. Rawlinson. The Nimrud sculptures are the oldest, belonging to a period ranging from 930 B.C. to 747 B.C. Those obtained from Khorsabad seem to have been executed under a monarch who reigned about 747-721 B.C., while the collection from Koyunjik belong to the time of Sardanapalus, apparently 721 B.C. and 625 B.C. The monuments consist chiefly of slabs of gypsum, alabaster, and limestone sculptured in low relief, the subjects being the exploits of the king whose palace walls they ornamented. Many of the sculptures are covered with cuneiform (q.v.) writing, which, by the labors of Rawlinson, Hincks, and Smith, has been deciphered, giving us a history of this remarkable people, and corroborating the narrative of the sacred Scriptures whenever they refer to the same event. See ASSYRIA. Besides the series of sculptures, the Assyrian collection includes a variety of smaller but highly curious and instructive objects, discovered at Nimrud and Koyunjik.

Greek and Roman Antiquities.—This collection occupies four apartments, which run parallel to the Egyptian gallery. The Lycian gallery contains a series of architectural and sculptural remains from ancient cities in Lycia, obtained by sir C. Fellows in 1842-46. In the next gallery are the remains of the famous mausoleum (q.v.) at Halicarnassus, erected in honor of Mausolus by his widow Artemisia. These remains were discovered by C. T. Newton, esq., in 1857-59. In the same room are some remains of the temple of Athene Polias at Priene, including the stone on which its dedication by Alexander the great is inscribed. The Elgin gallery contains the sculptures from Athens and Attica, the greater portion of which were obtained by the earl of Elgin, and purchased from him by parliament in 1816 for £35,000. The most important series in the gallery is the decorations of the parthenon (q.v.), which, notwithstanding their dilapidated condition, form the most valuable monument of Greek art which has descended to modern times. The gallery contains also sculptures and casts from the temple of Wingless Victory, the temple of Theseus, and the erechtheum, at Athens. In an extension recently made to this gallery, are a colossal lion from Cnidus, and a drum of a sculptured column, and other remains, from the temple of Diana at Ephesus. The Hellenic gallery contains a number of antiquities brought from Greece and its colonies at different times. The most important are 23 slabs of a frieze sculptured in mezzo-relievo, which, from the locality where they were found, are called the "Phigalian marbles."

The gallery on the s. side of the building is occupied with the Roman and Græco-Roman sculptures. The bulk of the collection was formed by Charles Townley, esq., and purchased in 1805 for £20,000. Subsequent additions have been made by the bequest

of the collection of R. P. Knight, esq., in 1824, and by various purchases and donations. The collection contains an interesting series of Roman portrait sculptures, and a very extensive mythological series, amongst which are some of universal fame—the Venus, Clytie, the Discobolus, and many others. A room on the basement is appropriated to mosaics and miscellaneous monuments, such as representations of animals, architectural and decorative fragments, and sacred and domestic implements. A fine collection from southern Italy, exhibiting specimens of the arts of the Etruscans, Greeks, and Romans, was bequeathed to the museum by sir William Temple in 1856.

The collections of smaller remains are placed in a suite of rooms on the upper floor. They consist of—1. An extensive series of vases, commonly though not correctly known as Etruscan, formed from the collections of sir W. Hamilton and Mr. Burgon, from purchases at the sales of the prince of Canino, M. Durand, and others; and from excavations in Sicily, Rhodes, and on the sites of Greek colonies in Cyrene and elsewhere. 2. A miscellaneous collection of terra-cottas, mural paintings, and other objects. 3. Bronzes of Greek, Etruscan, and Roman workmanship, consisting of sculptures, and various domestic and other articles, as candelabra, lamps, vases, horse-trappings, armor, etc. 4. The collection of engraved gems and gold ornaments now, since the addition of the Blacas and Castellani collections, perhaps the richest in the world.

Coins and Medals.—The very large collection of these objects is arranged in chronological order under five great divisions, viz., Greek, Roman, Mediæval and Modern, English, and Oriental. The department is under the care of a keeper, assistant-keeper, and four assistants.

British and Mediæval Antiquities and Ethnography.—The British collection is arranged in chronological order. The oldest series contains the antiquities of the stone and bronze periods, consisting of celts, daggers, swords, shields, and early pottery. The British-Roman antiquities comprise specimens of earthenware, lamps, and miscellaneous articles. A small collection of sepulchral urns, weapons, and personal ornaments represents the Anglo-Saxon period. The antiquities found in London, and belonging to the late C. R. Smith, have been recently added to this collection. The ethnographical collection contains antiquities, as well as objects of modern use, belonging to all nations not of European face.

In 1855, the extensive collections of antiquities and ethnography, belonging to Henry Christy, became the property of the museum, having been bequeathed by their proprietor. From the want of space, they are at present accommodated in a house rented for the purpose in Victoria street, Westminster. Felix Slade bequeathed his valuable collection of glass to the museum, and it is now arrayed so as to show the different phases through which the art of glass-blowing has passed, as well as the history of glass in all its branches.

Natural History.—In 1856 the trustees united the natural history departments under prof. Owen, who was then appointed superintendent of natural history. The new building recently erected at Kensington is intended to accommodate this section of the present museum.

Zoological Department.—To give an idea of the contents of this and the other natural history departments, would be to write an epitome of the various sciences they illustrate. This department contains a collection of animals arranged in systematic order in the galleries, comprising stuffed mammals, birds, reptiles, and fishes, and the hard portions of radiate, molluscan, and articulate animals. A room is specially devoted to the fauna of Britain. In rooms on the ground and basement floors are arranged the collections of insects, of osteology, and of specimens preserved in spirits. An idea of the extent of the collection may be formed from the fact that 142 separate publications, illustrative of the contents of the department, in the shape of catalogues, lists, etc., have been issued under the superintendence of the present indefatigable keeper, Dr. Gray. During the year 1874, there were added to this collection, 7524 specimens of animals, of which 2964 were vertebrata, 2886 mollusca and radiata, and 1674 annulosa. In 1873, the unique and extensive collection of birds formed in the eastern archipelago by Wallace, was acquired by purchase.

Botanical Department.—The herbarium of sir H. Sloane, the nucleus of this collection, consisted of about 8000 species, bound in 262 volumes. In 1820, the magnificent herbarium of sir Joseph Banks was bequeathed to the museum, and under the superintendence of the late Robert Brown, was transferred to two rooms prepared for it in the s.e. angle of the building. The collection has since been rapidly increasing: during the year 1872, 12,030 species of plants were added; and in the year 1873, the late William Wilson's herbarium of British and foreign mosses was acquired by purchase. The collection contains an extraordinary number of typical specimens—the identical plants from which the original descriptions were taken by Linnaeus, Aublet, Jacquin, Brown, Bentham, Bennett, and others. The exhibition rooms contain a series of specimens illustrating the most striking characteristics of the great divisions of the vegetable kingdom, arranged in order; and a series of fossil plants, the value of which is increased by the transparent sections showing their structure, which are placed beside them.

Geological Department.—This collection occupies the wall-cases of the principal gallery on the n. side of the museum. It contains an extensive series of the fossil remains of plants and animals from the various fossiliferous strata; it is especially rich in the

fossils of the secondary formations. Amongst its more valuable contents may be mentioned the collections of Dr. Mantell, the tertiary fossils collected by Dr. Falconer in India, and the remarkable fossil birds from New Zealand.

Mineralogical Department.—The minerals are contained in the table-cases in the geological gallery. They are arranged according to a chemical classification. Many valuable and unique specimens exist in the collection, which is rapidly increasing. In the year 1872, the number of specimens added was 1499.

The expenses of the museum are paid by grants of public money. According to the estimates, £110,949 were required during 1879-80.

Admission to the museum was at first obtained by printed tickets, which were delivered by the porter to persons making a written application. There could be no more than 45 visitors, at the utmost, per day, under the regulations then in force. Now, all who present themselves are freely admitted; and every week-day the museum is visited by large numbers: as many as 43,000 holiday-folk have passed through the building in one day.

BRITISH NAVY. Under NAVIES, MODERN, will be found a brief description of the chief navies belonging to the continent of Europe, and to the United States of America. The British navy is separately treated in this place.

While the Romans occupied Britain, they were obliged to maintain a fleet of war-vessels on the coasts, to protect it from the ravages of the Saxons, who were the pirates and buccaneers of those times. When the Romans had departed, and the Saxons became dominant, the coasts were infested by another naval power—the Scandinavian vikings. It was Alfred the great who first established what may be called a navy in this island, consisting of efficient vessels well manned, for protection, and not aggression. Ethelred made the building of a ship a condition for holding a certain acreage of land. William the conqueror strengthened the navy by the institution of the Cinque ports (q.v.). During the first three centuries after the conquest, we read of British fleets of 240,400, and even 730 sail—a proof that the vessels must have been very small even if there were no exaggeration of numbers. Until 1485, the fleets were collected just as wanted; but in this year, Henry VII. conceived the idea of a *permanent* navy, to be ready at all times. He built the largest ship of the age, the *Great Harry*. Henry VIII. pursued the course established by his father, and still further strengthened the navy by instituting the admiralty, the navy-office, the Trinity house, and the dockyards at Woolwich, Portsmouth, and Deptford. The *Henri Grace de Dieu*, the largest ship built by him, was of 1000 tons burden; but most of the vessels were high, unwieldy, and narrow, with the guns nearly down to the water's edge. The ships of the navy presented an aggregate tonnage of 12,000 tons at the period of Henry's death. Elizabeth made a large increase in the navy; but they were not all royal ships which were sent to struggle against the Spanish Armada. James I. made many improvements in ship-building, by encouraging a distinguished naval architect, Phineas Pett. Charles I., who built the *Sovereign of the Seas*, of 100 guns, was the first to group the royal ships into rates and classes. Cromwell brought up the navy to the strength of 154 sail, including a large number of two-deckers. Charles II. allowed it to fall into decay for a time; but his brother, the duke of York, who afterwards became James II., not only restored it, but brought it to a higher state of efficiency and strength than ever. When William of Orange became king of England, he found a navy carrying 7000 guns and 42,000 seamen; he built many additional ships, some with as many as 80 guns, and established Plymouth dockyard. Queen Anne succeeded to the possession of a fine navy; which at her death had increased to 198 ships, mounting 10,600 guns, with a tonnage of 157,000 tons. George I. attended to the navy chiefly in repairing the ships after a period of war, and in supplying a new armament. George II. greatly added to the number of ships, established a naval uniform, and increased the renown of the British navy during the war against Spain.

The long and eventful reign of George III. was especially distinguished by the achievements of the navy. When he came to the crown in 1760, he found himself in possession of 127 ships of above 50 guns, and 198 of 50 guns and under, manned by 70,000 seamen. These numbers, by building and by capture, were increased to 174 and 203 respectively, by the end of the American war. Throughout the European struggle, from 1793 to 1815, the B. N. exhibited a spectacle for vastness and achievements which had never before been equaled in any country. In the first nine years of this period, between 1793 and 1802, England lost by war 5 ships of the line and 46 smaller vessels; but she captured from the French, Dutch, Spaniards, and Danes, in various battles, 74 ships of the line and 519 smaller vessels; or rather, four fifths of this number were captured, and one fifth destroyed. Besides these, more than 800 privateers were taken and destroyed by the English. Of the total number of captures, 144 ships of war were at once converted into British ships, and added to our navy. When war recommenced in 1803, England had 189 ships of the line, and 781 smaller ships of war; during the next seven years, the seamen varied from 100,000 to 120,000, and in 1810 the number was raised to 140,000. At all times, many of the ships of the royal navy are unemployed or out of commission; but it frequently happened during that great war, that England had 450 liners, frigates, and sloops, besides smaller armed vessels, employed simultaneously. The conquered vessels added to the navy between 1803 and 1815 were upwards of 100 in number.

After the termination of the great European struggle, a large number of ships of war were put "in ordinary," or out of commission, and their officers placed on half-pay. In 1820, the vessels in commission, in ordinary, and building, comprised 127 ships of the line, 311 frigates and sloops, and 27 smaller vessels; but in this total of 465, there were only 113 in commission. In the 19 years that next followed, almost wholly years of peace, the total number of ships of the line, frigates, and sloops, decreased; the gun-brigs, schooners, and cutters increased in number; while the first germs of a new element, a *steam navy*, made their appearance.

The year 1839 must be viewed as a turning-point in the history of the British navy. Twenty-four years of peace had thrown the memory of warlike achievements into the background; and the house of commons had insisted on the lessening of those estimates which provide for armies and navies. It was now found, however, that both Russia and France had accumulated formidable navies. From that year to the present, the B. N., in common with the navies of other powers, has been undergoing a series of "reconstructions." First, ships of larger size, and carrying heavier guns, were built. These ships were of immense power in the days of wooden broadsides, but are now useless for purposes of war. The next stage, from about 1853 to 1859, was the conversion of our force from a sailing to a steam navy. This became the era of great steam frigates of about 5000 tons, and of heavy armaments in a few great guns, of which the *Mersey*, 36 guns, may be taken as a leading specimen. With the introduction of rifled guns, of force hitherto undreamt of, came the necessity for armor-plated sides. The fighting part of the navy (i. e., the line of battle) changed once more after 1860 to low-sided vessels, clad in thousands of tons of iron plates. The *Warrior* was the first ship so built in England, and she was followed by a whole squadron similarly protected. Guns, however, went on increasing in offensive power; and whereas 5-inch plates were at first thought sufficient, now 10-in., 12-in., 14-in., and even 22-in. plates are necessary to exclude shot. Such a vast weight of armor all over a ship would sink any vessel of moderate dimensions. The principle of turret-ships is therefore becoming predominant, in which the greater part of the vessel, clad in comparatively light armor, is under water, or only just visible above the surface. The earliest formidable turret-ship was the ill-fated *Captain*, which, in 1870, capsized in the bay of Biscay, and entombed 600 brave seamen, with the inventor, capt. Coles. Ships of analogous construction, with lower freeboard, have been since built; and now the *Inflexible*, of 11,165 tons, carrying 4 guns of 81 tons, is probably the most powerful war-ship that ever floated.

The expenditure on the B. N. greatly increased between 1839 and 1875, on account of the changes just adverted to. In 1839, the number of men and boys voted was little over 25,000; in 1878, it was about 60,000. Even as late as 1852, the expenditure was only £6,500,000, against £10,589,984 in 1879-80.

The B. N. is at present composed of 61 ironclads, about 300 steam-vessels, and 170 sailing-vessels. In the beginning of 1879, there were in commission 255 vessels. The unarmored ships comprise cruisers, dispatch vessels, gun-boats, several large old-fashioned two-deckers, troop-ships for India, tugs, old wooden vessels for harbor service.

All matters about ships, seamen, etc., will be found under their proper headings. See TURRET-SHIP; also ARMOR-PLATES and WAR-SERVICES.

BRITON. See BRITANNIA, *ante*.

BRITTANY. See BRETAGNE.

BRITTON, the title of the earliest summary of the laws of England in the French language, purporting to have been written by the command of Edward I. The compiler is unknown.

BRITTON, JOHN, an eminent English topographical and antiquarian writer, the son of a small farmer and village shopkeeper, was b. July 7, 1771, at Kingston-St.-Michael, near Chippenham, Wiltshire, and losing his parents young, received but a scanty education. Some short notices which he had contributed to the *Sporting Magazine* brought him into acquaintance with its publisher, Mr. Wheble, who employed him to compile the *Beauties of Wiltshire*, which he did in conjunction with a young literary friend named E. W. Brayley. They also prepared the *Beauties of Bedfordshire* in the same manner. B. afterwards issued a more elaborate work, entitled the *Architectural Antiquities of England*. One of the most important of his subsequent publications was *The Cathedral Antiquities of England*, 14 vols. fol. and 4to, 1814-35, with upwards of 300 highly finished plates. Altogether, his illustrated works of architectural and topographical description and antiquities number 87, besides others of a similar kind which he edited.

BRIVE, a t. of France, in the department of Corrèze, pleasantly situated in the midst of vineyards, and shut in by a fine circular avenue of elms, about 15 m. s.w. of Tulle. It has manufactures of woolen, cotton-yarn, etc. Pop. '72, 8016.

BRIXEN, a t. of Austrian Tyrol, at the confluence of the Eisack and the Rientz, 104 m. from Vienna by rail. It is a bishop's see, and has a cathedral, several monasteries, a theological seminary, and a gymnasium. There are iron and steel factories in the neighborhood. Nine miles away is the great fort of Franzensfeste, built in 1838. B. is mentioned in 901; it was walled in in 1038; was burnt in 1174, 1234, and 1445; in 1519.

it was stormed by the French, and in 1525 suffered from the rebellion of the peasants. Pop. '69, 4349.

BRIXHAM, a market-t. and seaport of Devonshire, England, beautifully situated on the s. side of Torbay, 5 m. s. from Torquay, and 23 m. directly s. from Exeter. The town occupies the sides of two hills, and is divided into two parts, called upper and lower B., the former consisting chiefly of a long straggling street. Some of the more recently erected parts of the town are well built, and contain good houses, but the older parts are mean. The prosperity of B. depends chiefly on its fisheries, it being the headquarters of the great Devonshire fishery of Torbay, in which many vessels are employed, mostly trawlers, of which there are about 200. These are decked sloops of 40 to 50 tons burden, and generally managed by three men and a boy. Great quantities of fresh fish are sent to London, Bath, and Bristol. Considerable quantities of iron ore are raised in the neighborhood and shipped here. B. has also a number of vessels engaged in the coasting and foreign trade, the foreign trade being chiefly with the Mediterranean. The admiralty have an establishment here for watering the navy. Near B. is a station of the South Devon branch of the Great Western railway. It was at B. that the prince of Orange, afterwards William III., landed, Nov. 4, 1688. Pop. '71, 4941.

BRIZA. See QUAKING GRASS.

BRIZURE, BRIZÉ or BRISÉ, terms used in heraldry to indicate that a charge is bruised or broken. See ROMPU.

BROACH, or BROCHE, an old English term for a spire springing directly from a tower without any intermediate parapet. Such spires are common in England, and in some places in Scotland, particularly in Fife.

BROACH, a t. in India. See BAROACH, *ante*.

BROAD ARROW, a government mark, stamped, cut, or otherwise fixed on all solid materials used in her majesty's ships or dock-yards, and on government stores generally, in order to prevent embezzlement. The origin of the mark is obscure. Previous to the year 1698, the naval authorities prosecuted a dealer in marine-stores, for having in his possession certain stores bearing the B. A. of his majesty. The defendant allowed the evidence against him to go on, and when asked what he had to say, replied that it was *very curious* that the king and he, as a dealer, should both have the same private mark on their property! The receiver of stolen goods was acquitted, and this led to the passing of the act 9 and 10 Will. III. c. 41 (1698), which enacts that persons in possession of naval stores, or goods of any kind marked with the B. A., or other marks therein mentioned, and usually employed in marking naval stores for the navy, shall forfeit all such goods and \$200, and also pay costs. The mark is for iron, wood, etc., what the color-thread is for sailcloth and ropes, which enables the government to identify the smallest piece of such articles.

BROAD-BILL. See SHOVELER.

BROAD BOTTOM ADMINISTRATION, a name derisively applied to the ministry formed by Henry Pelham in 1744, because it professed to include all parties of weight and influence in the state in a grand coalition, and comprised no less than nine dukes—viz., Dorset, Newcastle, Montagu, Bedford, Grafton, Richmond, Argyll, Devonshire, and Bolton, the first seven of whom were of the cabinet. Besides the prime minister, Pelham, the other principal members of the cabinet were earls Gower and Harrington, the marquis of Tweeddale and lord Hardwicke. From this B. B. A. the particular adherents of Pulteney (newly created earl of Bath) and lord Cateret were carefully excluded. The ministry was dissolved in 1754, by the death of Pelham, though several of its original members had seceded long before.

BROADCAST, a method of sowing grain, which distributes it with some degree of uniformity over the surface. When the sowing is done by hand, the seed is carried in a bag at the left side, and is scattered with the right hand while the sower walks on with measured tread. The seed is afterwards covered with a harrow, or by dragging brush over it. Machines have been devised for sowing grain in this manner. The method of sowing by the drill is preferred by most intelligent farmers.

BROAD CHURCH, the name given to a portion of the church of England which holds a position unidentified with either the High or the Low church party. The High church branch holds rigidly to apostolic succession, maintains the divine right of episcopacy, and in general the sacramental view of the church and the Christian life; of this company are those known as "Ritualists," though not all who are High church would accept the name of Ritualists. (See RITUALISM.) From this section came those known a few years since as "Puseyites." The Low church section recognize non-prelatical bodies of Christian believers as in some sense churches; in doctrine they are mainly Calvinists; they are often called Evangelicals. The Broad church section are the latest of the three divisions, but embrace a large number of churchmen of high cultivation and talent, such as dean Stanley, canon Kingsley, Maurice, and others of note. The tendency of the Broad church leaders is towards a liberal view both of Christian doctrine and church organization. Yet the High on the one hand, the Low on the other, and the Broad between the two subscribe to the same formularies, which they interpret

in differing senses, and from which they deduce opposite results. It should be understood that these names are used only colloquially for popular convenience, and are not accepted in either England or America as legitimate designations. They show tendencies.

BROADCLOTH. See **WOOLEN** and **WORSTED MANUFACTURES**, *ante*.

BROADDUS, **ANDREW**, D. D., 1770-1848; a Virginian; a Baptist preacher, compiler of the *Dover Selection* and *Virginia Collection* of hymns, and a popular pulpit orator. Some of his sermons have been published.

BROAD MOUNTAIN, in the coal region, Carbon and Schuylkill cos., Penn. It is about 2000 ft. high and extends for 50 m. n.e. and s.w.

BROAD RIVER, a stream of North and South Carolina rising in the Blue Ridge, and joining with the Saluda, forming the Congaree. The city of Columbia is at the junction of the two rivers. The country around B. R. is exceedingly fertile and productive.

BROADSIDE, in naval warfare, is the simultaneous discharge of all the guns on one side of a ship of war. The fighting power of a ship is sometimes estimated by the weight of her broadside, i.e., the weight of all the shot and shell that can be fired off at once from one side or half of the ship. Thus, the broadside of the old-fashioned *Duke of Wellington*, 131-gun war-steamer, amounted to 2400 lbs. One reason why a paddle-steamer is not so good for war purposes as a screw-steamer, is because the paddle-boxes and wheels interfere with the broadside. With the introduction of iron-clad turret-ships the term is becoming less applicable.

BROADSTAIRS, a t. in England $1\frac{1}{2}$ m. s. of North Foreland and 3 m. from Margate. It has a small pier built early in the 16th c., and an archway leading to the shore built in 1540. Near the pier is a chapel to the Virgin, in honor of which ships were once accustomed to furl their topsails as they passed. B. is a place of summer resort. Pop. '71, 1926.

BROADSWORD is a sword with a broad blade, for cutting only, not for stabbing, and therefore not sharp at the point, like a saber. It is but little used in the British army.

BROAD TOP MOUNTAIN, in Bedford and Huntingdon cos., Penn., 2500 ft. above the sea. It has large beds of bituminous coal.

BROADUS, **JOHN ALBERT**, D. D., LL. D., b. Va., 1827; educated in the university of Virginia; pastor of the Baptist church in Charlottesville, and in 1859 professor of New Testament interpretation and homiletics in the Southern Baptist theological seminary in Greenville, S. C. Dr. B. is proficient as a Greek scholar. He has published, among other papers, *The Preparation and Delivery of Sermons* and *Recollections of Travels*.

BROCADE. This term is used to describe a silken fabric on which a figure of any kind is formed by the threads of the warp or weft being raised by the heddles, or, more generally, by the Jacquard-loom, in such order as to produce the pattern required. The word has much the same application to silk textures that damask has to linen textures or to worsted textures for upholstery uses. See **WEAVING** and **JACQUARD-LOOM**.

BROCAGE. See **BROKER**.

BROCAGE BONDS TO PROCURE **MARRIAGE**. OR **MARRIAGE BROCAGE BONDS**, as they are otherwise called, are void by the law of England, being against the policy of the law and the freedom of marriage. See Hurlstone's *Law of Bonds*, 1835, p. 15, and authorities there referred to. The Scotch law is the same.

BROCCOLI, a well-known and much esteemed garden vegetable, one of the many varieties which cultivation has produced of the *brassica oleracea*, the common kale or cabbage. B. is said to have been originally brought to Italy and other parts of Europe from the isle of Cyprus about the middle of the 16th century. Its name is probably of Italian origin. It differs little from cauliflower (q.v.), of which it may be considered a mere variety, having colored instead of white heads, and a deeper tinge of color in the leaves, being also more hardy, the character from which its chief importance is derived, as it can be readily obtained at seasons when there is no cauliflower in the open garden. It is perhaps inferior to cauliflower, however, in delicacy of flavor. There are many subvarieties, the number of which is, of course, continually increasing; and some of these are preferred for early spring sowing, with a view to an autumn crop; others for later sowing, with a view to a crop in the following spring. The subvarieties differ in size, in their more cut or entire leaves, in the greater or less degree of color—generally purple—with which the leaves are tinged, in the more or less compact form of the whole plant, in the more or less green, yellow, or purple color of the head, etc. Some of the kinds of B. preferred for late sowing and spring use are known by the general name of cape B., the first of them being said—but on doubtful authority—to have been introduced into Britain from the cape of Good Hope. The mode of cultivation of B. pretty much resembles that of cauliflower, except as to the times of sowing and transplanting, and that it is generally—even in Scotland—sown in the open ground, and not in a hot-bed. A similar richness of soil is required. Various modes of protection in winter are adopted. In mild winters, protection is scarcely or not at all needed, but precautions

U. K. III.—6

are generally employed against severe weather. It is found very advantageous to plant in trenches of 6 in. deep, and to earth up the plants, as they are thus not only in some measure preserved from frosts, but also from the winds of winter, which are apt to shake and loosen plants, so as to cause their destruction. It is a common practice to take up some of the most advanced plants in the beginning of winter, and to lay them in a sloping position with their heads towards the north. The heads produced in this way are not in general so large as they might be, but they are sometimes procured when otherwise they probably would not.

BROCCHI, GIOVANNI BATTISTA; an Italian geologist, 1772-1826. He studied at Pisa, and was professor of botany in 1802 at Brescia, but devoted himself chiefly to geology. In 1808, he was made inspector of mines for Italy. In 1823, he went to Egypt, and two years after Mehemet Ali made him one of a commission to organize for the conquest of Sennaar. B. fell a victim to the climate at Khartoom. Among his works are *Treatise on the Iron Mines of Mella*; *Essay on the Physical Constitution of the Metalliferous Mountains of the Valley of Trompia*; *Mineralogy of the Valley of Fassa and the Tyrol*; *Fossil Geology of the Apennines*, etc.

BROCHURE, a French word (from *brocher*, to stitch), equivalent to the English word pamphlet (q. v.).

BROCK, Sir ISAAC, an English gen. killed in the battle of Queenstown, Canada, Aug. 16, 1812. Not long before, he had captured gen. Hull (suspected of treason) and his forces. There is a monument to his memory on the w. bank of the Niagara river.

BROCKEN (*Mons Bructerus*, *Melibocus* of the ancient Romans), popularly known as the *Blocksberg*, is the highest summit of the Harz mountains. It is situated in the province of Saxony, Prussia, about 20 m. w. s. w. of Halberstadt, and has an elevation of 3740 ft. above the sea. The mountain is very frequently veiled in mist and cloud-strata, and is celebrated for the phenomenon known as the *Brockengespenst* ('specter of the Brocken'), which is nothing more than the shadow of men, houses, or other objects thrown upon the misty eastern horizon by the light of sunset. (See *Gallery of Nature*, published by W. & R. Chambers.) In clear weather, a fine view is obtained from the summit of the Brocken.

BROCKETT, LINUS PIERPONT, M.D., b. Conn., 1820; graduated from Yale medical college in 1843. After a few years he left medical practice for literature, and has written for the *New American Cyclopaedia*, etc. Among his separate works are *Our Great Captains*; *Woman's Work in the Civil War*; *Woman, her Rights, Wrongs, Privileges, and Responsibilities*; and *Epidemic and Contagious Diseases, their History, Symptoms, and Treatment*.

BROCKHAUS, FRIEDRICH ARNOLD, the founder of the well-known firm of B. in Leipsic, and publisher of the *Conversations-Lexicon*, was b. at Dortmund, May 4, 1772. In 1802, circumstances led him to Holland, where, however, his business schemes did not prosper. He returned to Germany in 1810, and in the following year commenced business in Altenburg. Before this, however (in 1808), B. had purchased the copyright of the *Conversations-Lexicon*, which had been commenced in 1796, and he completed the first edition, with the addition of two supplementary volumes, in 1809-10. In 1812, a second improved edition of the work was commenced under the supervision of B. as editor. The peace of 1815 enabled B. to pursue prosperously his peaceful and civilizing career. In 1817, his business had so increased, that he found it necessary to leave Altenburg for Leipsic, where, in the following year, he commenced book-printing in addition to book-publishing. In the course of a few years, the *Lexicon* passed through six editions; it has now arrived at the eleventh edition. Through all the enterprises of B. as a publisher, a zealous devotion to the cause of liberty and general enlightenment may be traced. He died Aug. 20, 1823. B. was not only an able and assiduous man of business, but distinguished for his literary culture, his knowledge of the world, and his numerous social accomplishments. He was also eminently patriotic, and furthered many literary undertakings, simply through a pure love of "fatherland."

The business was afterwards carried on by HEINRICH B., second son of the former (b. 1804, d. 1874), and now by Heinrich's sons, Rudolf and Edward. Among the numerous publications issued by the house, may be mentioned the later editions of the *Conversations-Lexicon*, with an *Atlas*; the *Universal Encyclopaedia*, by Ersch and Gruber; and the German *Penny Magazine*, founded in 1833.

BROCKHAUS, HERMANN, third son of F. A. Brockhaus, was b. at Amsterdam, Jan. 28, 1806; studied at Leipsic, Göttingen, and Bonn, and lived successively in Copenhagen, Paris, London, and Oxford. From 1848 till his death in 1877, he held at Leipsic the chair of ordinary professor of the Sanscrit language and literature. Among his several works on oriental literature may be mentioned the *First Five Books of the Large Collection of Fables, Kathā Sarit Sāgara, in Sanscrit and German* (1839); an edition of the drama *Prabodha Candrodāya*, by Krishna Misra, with Hindu scholia (1845); Nachscheb's Persian version of the *Seven Wise Masters* (1845); and (in 1854) the Persian text of the *Songs of Hafiz*. After 1856, he was editor of the *Universal Encyclopaedia*. B.'s method of printing Sanscrit in Roman types is now generally adopted in Germany.

BROCKPORT, a village in Monroe co., N. Y., on the Central railroad and Erie canal, 18 m. w. of Rochester; noted for manufactures, especially of pumps and agricultural machines. There is a state normal school here.

BROCKTON, a t. in Plymouth co., Mass., on the Old Colony railroad, 20 m. s. of Boston; pop. '80, 13,605. The manufacture of boots and shoes is the chief industry.

BROCKVILLE, a t. of Upper Canada, or Ontario, taking its name from gen. Brock, who, during the last American war, died in the arms of victory on Queenston heights, between the town and falls of Niagara. It stands on the left bank of the St. Lawrence proper, about 40 m. below Kingston, and about 160 above Montreal. Originally, its communications downward were interrupted by powerful and rugged rapids, which, however, are now, one and all, either avoided by canals or overcome by steam. B. is a thriving place, with (1871) 5102 inhabitants.

BRODERICK, DAVID COLBRETH, 1818-59; b. Washington; an energetic uneducated man, who became a political leader in New York city, and was elected to congress. In 1849, he went to California, and in 1856 was chosen United States senator. In consequence of some plain words, B. was challenged by David S. Terry, a judge of one of the state courts, and fell in the duel which followed.

BRODERIP, WILLIAM JOHN, 1787-1859; an English writer on natural history. He studied law, practiced, edited law reports, and was for 34 years a metropolitan police magistrate; but his leisure was devoted to science, and he was a member of most of the important societies, contributed to their *Transactions*, and promoted especially the study of zoology, being many years vice-president of the zoological society. Much of his scientific writings appeared in *Fraser's Magazine*.

BRODHEAD, JOHN ROMEYN, LL.D., 1814-73; b. Philadelphia; a graduate of Rutgers college, and a student at law, but after brief practice he turned his whole attention to American history, especially that concerning the early settlement of New York. In pursuit of this object, while connected with the United States legation in Holland, he thoroughly searched the archives at the Hague and elsewhere in that country, and in England and France. His great labor was rewarded by the collection of more than 5000 documents, more or less important, of which many had until then been unknown to historians. These papers were printed by the state of New York in several large folio volumes. In 1846, B. was secretary of legation in London, where he wrote the greater part of his *History of the State of New York*, the last volume of which was published in 1871. From 1853 to 1857 he was naval officer of the port of New York. He was a leading member of the New York historical and other learned societies in this country and abroad.

BRODIE, Sir BENJAMIN COLLINS, Bart., a distinguished surgeon, third son of the rev. Peter Bellinger Brodie, rector of Winterslow, Wiltshire, was b. there in 1783. He studied under sir Everard Home at St. George's hospital, to which he was, in 1808, elected assistant-surgeon, and afterwards surgeon. He had previously lectured both on anatomy and on surgery. In 1810, he was elected a fellow of the royal society, and in 1811 received their Copley medal for his physiological papers contributed to the *Philosophical Transactions*. In 1834, he was created a baronet, and he held the appointment of serjeant-surgeon to queen Victoria, as well as that of first surgeon in ordinary to the prince consort. He was made D.C.L. of Oxford in 1850; was president of the royal society; a corresponding member of the institute of France, and a foreign member of other learned societies and academies in Europe and America. Author of *Lectures on Local Nervous Affections* (1837, 8vo); *Hunterian Oration*, 1837; *Lectures Illustrative of Subjects in Pathology and Surgery* (1840, 8vo); *Introductory Discourse on the Duties and Conduct of Medical Students* (1843, 8vo); *Psychological Inquiries as to Mental Faculties* (3d ed., 1856); an edition of his works with *Autobiography* appeared in 1865. He also contributed papers to several scientific journals. He died in 1862.—B.'s son, sir B. C. BRODIE, F.R.S., was in 1855 elected Aldrichian prof. of chemistry at Oxford, a chair suppressed in 1866.

BRODY, a t. of Galicia, Austria, s situated on a swampy plain, surrounded by forests, about 58 m. e.n.e. of Lemberg. B., which was made a free commercial town in 1779, has a large trade in the agricultural produce of the country with Russia, Poland, and Turkey. Its chief manufactures are leather and linen; jewelry, manufactured goods, and colonial produce are imported by way of Odessa. The trade is almost entirely in the hands of the Jews, who form so large a proportion of the inhabitants, that B. has been called "The German Jerusalem." Pop. '69, 18,890.

BROG, or BROGUE, a rudely formed species of shoe, formerly in use by the aboriginal Irish and the Scottish Highlanders, and of which there were different varieties. See SHOES, SHOE-TRADE. The name has been applied to a modern kind of shoes, with some fanciful peculiarities.—The term brogue is also used to signify the peculiar pronunciation of English that distinguishes natives of Ireland.

BROGLIE, ACHILLE LÉONCE VICTOR CHARLES, Duc de, 1785-1870; a peer of France. The family was Piedmontese, but won distinction in the armies of France. The first marshal de B. served under Louis XIV.; his son reached the highest grade of

the French peerage; the second marshal commanded in the seven years war, was made a prince of the empire, and by Louis XVI. made commander-in-chief. He refused to serve under Napoleon, and died in voluntary exile. His son followed Lafayette to America, but soon returned, served on the staff in the republican army of the Rhine, was denounced, arrested, and guillotined, June 27, 1794. His injunction to his son (the subject of this sketch, then but 9 years old) was to remain faithful to liberty even though she were ungrateful and unjust. "His father murdered, his mother in prison, his property confiscated and plundered, the young de Broglie first appears in life in wooden shoes and a red cap of liberty, begging an assignat from the younger Robespierre." Yet he adhered to the cause for which his father died, and maintained through life the principles of 1789, seeming to have forgotten even his rank until reminded of it by a summons to the chamber of peers. Early in life he was one of Napoleon's council of state. With high rank, independent fortune, unblemished integrity, unflinching patriotism, and a sincere and consistent attachment to liberal opinions, B. entered the chamber in 1815, just before he was 30 years old. His first opportunity was on the trial of marshal Ney, and he alone had the courage to speak and vote for acquittal on the ground that the marshal was not guilty of premeditated treason. During the restoration he was active in the defense of liberal opinions and measures, opposing the reactionary policy of the court, and acting with the doctrinaires, of whom Guizot was the ablest representative. In 1816, he married Mme. de Stael's daughter. About the same time he became an ally of Clarkson and Wilberforce in the cause of the emancipation of negroes from slavery. In Louis Philippe's first cabinet he reluctantly took the bureau of public worship, and in 1832, upon strong urging, became Cassimir Perier's successor as minister of foreign affairs, in which office he strengthened the bonds between France and England, negotiated the quadruple alliance, assisted in settling the Belgian and Greek questions, and labored with success to preserve the peace of Europe. In 1835, he was the head of the cabinet, and, riding beside the king when Fieschi's attempt at regicide was made, B. received one of the bullets through his coat collar. He retired permanently from public life in 1836. Though not in office, B. preserved through life close personal and political friendship with Guizot. The overthrow of the constitutional monarchy in 1848 was a severe blow to the duke; but he consented to sit in the republican assemblies, and labored to counteract some of what he deemed to be the evils of universal suffrage and to avert the *coup d'état* which he saw was impending. When it came he was conspicuous as one of the bitterest enemies of the imperial regime, though he admitted that an empire was "the government which the poorer classes of France desired, and the rich deserved." His last 20 years were devoted to philosophical and literary pursuits. With regard to the future, he said: "I shall die a penitent Christian and an impenitent liberal." He was a member of the academy and other societies, in whose labor he took assiduous interest. He was succeeded by Albert de B., his eldest son, also of literary distinction, who has had a prominent part since 1871 in the national assembly, and was for some time the head of marshal MacMahon's cabinet.

BROGLIE, ALBERT, Duc de, son of Achille, b. 1821; statesman and author, elected a member of the academy in 1862. His main work, *The Church and the Roman Empire in the Fourth Century* has passed through several editions. He has also published Leibnitz's *System of Religion; Questions of Religion and History*, etc. M. Thiers made him minister of foreign affairs, and ambassador to Great Britain.

BROHAN, JOSÉPHINE FÉLICITÉ AUGUSTINE, b. 1824; a French actress, excelling specially in the higher dramas, such as those of Moliere, Beaumarchais, and Victor Hugo. She has also produced some pieces of her own. On the death of Rachel she took the great tragedienne's chair in the conservatory. Her two sisters are well known on the stage; Susanne, and Emilie Madeleine.

BROILING is a convenient and expeditious mode of cooking small pieces of meat, by laying them on a gridiron over a bright fire, or even on the coals themselves. This is perhaps the most primitive mode of preparing meat for eating, as may be supposed from the great ease and simplicity with which the operation is managed. B. is, in fact, a quicker sort of roasting. The albumen of the outside being sealed up at once, the meat is rendered extremely nutritious, and therefore this process is much to be recommended. But to broil meat so as to preserve its odor, juice, and fat, requires care. The meat should be prepared for the gridiron by being beaten slightly with the rolling-pin, trimmed of superfluous fat and skin, and cut so as to look well on the dish. The fire should be perfectly clear, and of a red-hot surface to answer to the size of the gridiron, that all parts of the meat may be equally cooked. Just before setting the gridiron over, some salt should be sprinkled on the fire to prevent the flare. The gridiron should be perfectly clean and smooth, being always rubbed when it is put away; and, before using, it should be warmed, greased with suet, and rubbed again with paper. When it is placed on the fire, the back should be higher than the front. The meat should never be touched with a fork, but turned rapidly with the broiling tongs; and when sufficiently done, should be served immediately on a very hot dish, being seasoned according to taste. In large ranges there should be a broiling stove, and an apparatus for B. suited to it; by this the heat of the fire can be easily regulated. But for all ordinary purposes, a fire of charcoal, or of common coal, and a grooved gridiron, to preserve

the gravy, is all that is necessary. Sometimes a gridiron is used to hang before the fire, when a dinner is being dressed and the top of the fire occupied; this is convenient, but it is an inferior way of cooking, the meat being roasted rather than broiled. There is a gridiron sold in the streets which is very well adapted to small low fires, as it is easily put in between the bars.

BROKE, Sir PHILIP BOWES VERE, 1776-1841; an English admiral of the war of 1812; he commanded the *Shannon*, and sent a challenge to fight to the American capt. Lawrence, just promoted to the command of the *Chesapeake*. Before the latter arrived, Lawrence, who thought the mere appearance of a British vessel to be a challenge, went out to meet him. An action ensued, June 1, 1813, in sight of the land off Boston. Lawrence was almost immediately mortally wounded, and his badly supplied and badly manned vessel was captured. The victory raised B. to knighthood.

BROKEN KNEES. The part commonly termed the knee of the horse is the carpus or wrist of man, and from the peculiar conformation of a quadruped, is much exposed, and liable to serious injury. By *broken knee* is meant the abrasion or more serious injury of the joint by a fall; and even when the wounds are healed, the scar usually remains to indicate that the horse has once fallen, and is "broken-kneed." An animal is then regarded as unsafe, and seriously deteriorated in value.

Causes.—The fall is necessarily the immediate cause of the broken-knee; as to the cause of the fall, it is usually to be looked for elsewhere than in the horse himself. As a rule, the safety of a horse's action is very great, particularly about the age of from four to seven or eight years. Rarely does a horse at any age fall on his knees, unless his feet have suffered from improper shoeing; the animal then moves cautiously, and is very apt to "stumble." Undoubtedly, some horses of defective conformation and sluggish disposition are more likely to stumble and fall than a well made, high-actioned steed; nevertheless, the most perfect animal may gradually be rendered unsafe by improper shoeing. See SHOEING OF HORSES.

Symptoms.—It is important, so soon as the injury is done, to determine the extent and depth of the wound. If it be merely a superficial wound, the case is a simple one; and unless the skin is much bruised, the hair will grow, and the animal not be permanently blemished. The sheath, however, through which the tendon over the joint passes, may be opened, and the tendon itself injured. The wound is then gaping, heals rather slowly, and sloughs have to be thrown off. Lastly, the joint itself may be opened, and this is indicated by a free discharge of the joint-oil or synovia, and by the bones being seen or felt on probing. The worst form of accident is that when the bones of the joint are fractured. The system suffers when the wounds are serious, and severe fever sets in.

Treatment.—Whatever may be the form of injury, the first injunction is to wash the wound thoroughly with cold water applied constantly for hours. The joint will swell, become hot and painful, and in some cases irritative fever occurs. Then the animal should be kept on low diet, and be purged with four, five, or six drachms of aloes, according to its size, etc. Should the wound be deep, much dirt remaining in the tissues, a large linseed-meal poultice should be applied over the joint for a day or two, until free suppuration sets in. If this is retarded, and in all cases when the poultice does not appear necessary, cold fomentations may be continued, using either some infusion of chamomile, or one part of tincture of arnica to twelve of water, or one part of Goulard's extract to a similar quantity of water. The severe symptoms speedily subside, unless the bones are fractured or the joint otherwise seriously injured. Usually, the wound heals rapidly, the joint-oil ceases to flow; and in order to insure a contraction of the wound, mild astringent or caustic applications should be used, such as tincture of myrrh, sulphate of zinc lotion, or sulphate of copper in crystal rubbed over it. When the wound is thoroughly healed, the hair may not grow rapidly, even in parts where it should form: in this case its production may be accelerated by the use of a very mild cantharidine ointment, which should act as a mild irritant, but not as a blister. In some cases of severe broken knee, it is advisable to fix the limb so that the animal may not move the joint much. In veterinary jurisprudence, a broken knee is regarded as a *blemish*, not as an unsoundness.

BROKEN WIND, a disease or unsoundness of the respiratory organs of the horse, which, from the French *pousse*, was termed, by some of the old English writers on farriery, *pursiness*. The Germans term it *dämpfigkeit*, or asthma, though in many of their works it receives also the name of *herzschlagigkeit*, from a belief that it consists in palpitation of the heart. The nature of the malady is not well understood, though it appears in the form of difficulty in the act of expiration, the horse making an extraordinary or spasmodic effort to expel from the lungs the air which has readily entered them in inspiration.

Symptoms.—A broken-winded horse is usually an animal that does not thrive, is lean, and has a dependent belly, the muscles of which are unusually active as expiratory muscles. The characteristic symptoms are best observed when the horse is exercised, the breathing becoming very labored, the nostrils dilated, the eyes bloodshot, and even blue, showing imperfect purification of blood in the lungs. On watching the chest and flank, the ribs are observed very actively moved, and after collapsing, when the air is expelled from the lungs, are further depressed by a spasmodic jerk brought about by the

abdominal muscles. A broken-winded horse has a bad cough, of the kind referred to by veterinarians as characteristic of unsoundness, and termed a *hollow cough*. When the animal is oppressed by fast work, or dragging a load up a hill, the pulse is excessively rapid, and the heart beats energetically. From this circumstance, it is regarded by some as a disease of the heart. Others have believed the diaphragm affected, but in reality it is the lungs, or the apparatus for expelling the air from these organs, that is at fault. The diaphragm being a muscle of inspiration, it is probably in no way implicated. No doubt, when the heart is diseased, the function of breathing is sometimes much affected, but these are not the symptoms of the true broken-wind, any more than when the lungs are in part rendered impervious to air, and the act of inspiration is rendered short. This condition constitutes *thick wind*, and is often one of the remote results of inflammatory disease of the lungs.

Causes.—Low-bred horses are liable to B. W., especially if improperly fed on innutritious and bulky food, and at the same time kept at hard and fast work. Whatever may be the way in which the condition of the alimentary canal operates in producing B. W., of this we are certain, that the function of digestion is much impaired. Indeed, the term B. W. is believed to have had reference originally to the constant escape of flatus. B. W. is far more rare now-a-days than of old, and it is at present most common in those countries where horses are worst managed, and fed almost exclusively on coarse, indigestible, or innutritious kinds of hay and beans.

Treatment.—The treatment of B. W. is very unsatisfactory; and we can only hope for palliation of the symptoms by keeping the alimentary canal in proper order, administering occasional purgatives, and feeding on a proper quantity of the best oats, which should always be bruised; also allowing the horse the best hay in spare quantities—viz., from 10 to 12 lbs. daily. Some veterinarians have vaunted their powers of curing this disease, and recommended large doses of camphor, digitalis, and opium; but these potent narcotics only operate for a very short time, and as their effects pass off, the symptoms return, and often with increased severity. We may say that B. W. is incurable; and horses very frequently drop down exhausted when at hard work, and die either from congestion of the lungs, hemorrhage, or simple suffocation.

B. W. is so bad a form of unsoundness that horse-dealers sometimes attempt, and even successfully, to hide the defect for the time they may be engaged in the sale of a horse, and this they do by causing the animal to swallow *shot or grease*. A certain portion of lead weighing in the stomach has a wonderful effect in diminishing the symptoms, which become again obvious enough for a few hours after the ruse has been practiced on some unwary purchaser.

BROKER (so called, from a Teut. and Slav. root, *brak* or *wrak*, signifying refuse, blemish; as if the function had originally been to select good articles of merchandise and reject blemished ones: the German term is *mäkler*, from *makel*, blemish), an agent employed to make bargains and contracts between other persons, in matters of trade, commerce, and navigation, for a compensation commonly called brokerage. Where he is employed to buy or sell goods, he is not intrusted with the custody or possession of them, and is not authorized to buy or sell them in his own name. In this respect, he differs from a factor, and he differs from an auctioneer in two particulars: a B. may buy as well as sell, but an auctioneer can only sell; a B. cannot sell personally at public auction, for that is the appropriate function of an auctioneer, but he may sell at private sales, which an auctioneer (as such) does not. A B. is strictly a middleman, or intermediate negotiator between the parties, and for some purposes, he is treated as the agent of both parties, but primarily he is deemed merely the agent of the party by whom he is originally employed. There are several sorts of brokers, such as stock-brokers, share-brokers, ship-brokers (q.v. in SUPP., Vol. X.), insurance-brokers, and bill-brokers (q.v.). Persons who appraise goods, sell or distrain furniture for rent, are also called brokers, although differing entirely in their occupations from the preceding commercial agents. The business of a pawnbroker (q.v.) is also of a different nature.

Brokers, in London, must be admitted by the lord mayor and aldermen, paying £5 on admission, and a like sum annually, under a penalty of £100; but they are no otherwise subject to the control of the court of aldermen. A list is kept by the city of brokers admitted, and of those who have been convicted of fraud or disqualified (33 and 34 Vict. c. 60).

By the larceny consolidation act, 24 and 25 Vict. c. 96, s. 76, it is enacted that any person, who, being a banker, merchant, B., attorney, or agent, and being intrusted for safe custody with the property of any other persons, shall in any manner convert or appropriate it to his own use, shall be guilty of a misdemeanor, and be liable to be kept in penal servitude from five to seven years, or to suffer some other punishment, by imprisonment for not more than two years, with hard labor or confinement. See FACTOR.

BROKER (*ante*). In the United States, brokers are classed according to the nature of their business. In general, the word means a dealer in money or stocks; but besides the bill and note broker there are exchange, insurance, cotton (and other merchandise), pawn, real estate, and ship brokers. The B. is paid by a commission on his sales, or by a special agreement. Usually brokers do not disclose the names of their principals.

There is an implied warranty in dealing with a broker that the thing he sells is all that it pretends to be, and if a bill sold be found a forgery, he is held responsible.

BROKERAGE is the remuneration or compensation allowed to a broker (q.v.).

BROMBERG, a t. of Prussia, in the province of Posen, 69 m. n.e. from the city of that name, is situated on the Brahe, about 6 m. from its junction with the Vistula. B. has manufactures of woollens, linen, chicory, tobacco, and Prussian blue; a large sugar-refinery, distilleries, breweries, potteries, and corn-mills. The *Bromberg canal*, by uniting the rivers Netz and Brahe, connects the Oder and Elbe with the Vistula. Pop. '75, 31,808.

BROME, a co. in the province of Quebec, Canada, on the Vermont border; 350 sq. m.; pop. '71, 13,757. The Green mountains occupy a portion of the county. Capital, Knowlton.

BROME-GRASS, *Bromus*; Gr. *bromos*, a kind of oat; a genus of grasses, very nearly allied to fescue (q.v.), with flowers in lax panicles, glumes many-flowered, the outer palea bifid at the extremity, and awned beneath, and the very short stigma growing from the face of the germen, beneath its apex. The species are numerous, and some of them are very common British grasses—none more so than the **SOFT B.** (*B. mollis*), an annual or biennial, which has very soft downy leaves, grows well on poor soils, and is readily eaten by cattle, but is not much esteemed by farmers, either for the quantity or quality of fodder which it yields. Its seeds have also the reputation of possessing deleterious or poisonous properties: and those of two other species of this genus, *B. purgans* and *B. catharticus*, the former a native of North America, and the latter of Chili, are said to be emetic and purgative. The whole subject of the existence of poisonous properties in the seeds of any of these grasses, requires further investigation. **SOFT B.**, although now disliked by farmers, was formerly sown as a fodder-grass, and its large seeds were even regarded as making hay more nutritious; so that there are some who view its present proscription as a thing which ought to be reconsidered, and who deem it not improbable that its weighty produce, both in foliage and seeds, and its adaptation to poor soils, may yet recommend it to the favor of agriculturists. Very similar to it are **SMOOTH B.** (*B. racemosus*), **FIELD B.** or **MEADOW B.** (*B. commutatus* or *B. pratensis*, and *B. arvensis*), all of which seem very much to resemble it in their properties.—The **TALL B.** (*B. giganteus*, also known as *festuca gigantea* and *bucetum giganteum*), a native of Britain, which reaches the height of 4 or even 5 ft., affords a great bulk of foliage, but is not much relished by cattle. Naturally growing in shady places, it succeeds even in dense woods, and is sometimes sown to form covert for game.—**RYE B.** (*B. secalinus*) is generally regarded as a troublesome weed, especially in fields of rye. It is very abundant in some parts of Europe. In a young state it has a great resemblance to rye. Its seeds, which are large, retain their power of germination for years, and do not lose it by passing through the intestines of animal. Deleterious effects have been erroneously ascribed to bread made from rye, along with which these seeds have been ground; but poultry are very fond of them, as of those of other species of this genus.

BROMELIACEÆ, a natural order of monocotyledonous plants, allied to *amaryllidææ* and *iridææ*, stemless, or with short stems, and rigid, channeled, often spiny and scaly leaves. The flowers are in racemes or panicles; the calyx 3-parted or tubular, persistent, more or less cohering with the ovary; the petals three, withering or deciduous, equal or unequal, imbricated in bud. The stamens are six, inserted into the tube of the calyx and corolla, the anthers opening inwards. The ovary is 3-celled, the style single, the fruit capsular or succulent, many-seeded; the seeds with a minute embryo lying in the base of mealy albumen.—The order contains about 170 known species, all natives of the warmer parts of America, although some of them are now naturalized both in Asia and Africa. The best known plant of the order, and the only one much valued for its fruit, is the pineapple (q.v.). B., with their strong spiny leaves, cover the ground in many places, so as to form impenetrable thickets. Many of them are epiphytic, or grow upon trees, without being parasites, particularly the species of *tillandsia*, one of which is the New Orleans moss, long beard, or old man's beard of the West Indies and of the southern parts of the United States, hanging from the trees like the lichens of colder climates. The leaves of some are so formed and placed as to retain near their base a quantity of water, often affording a delicious refreshment to the traveler in a hot climate. The water is, perhaps, of use to the plant itself in droughts. Not a few of the B. are capable of vegetating long without contact with earth, and of sustaining long drought without inconvenience, for which reason, and because of their beautiful and fragrant flowers, some of them are very frequently suspended from balconies in South America as air-plants. But the plants of this order are more generally valuable for their fibers than upon any other account. *Tillandsia usneoides*, the New Orleans moss already mentioned, yields a fiber, easily obtained, and in great abundance, which is used instead of hair for stuffing mattresses. The fibers of the leaves of the pineapple, and of some other species of this order, have been made into fabrics resembling the finest white muslin, whilst they are found also to possess sufficient strength for cordage. It is supposed that the produce of different species of *bromelia* is often included along with that of the American aloe or *agave* (q.v.), under the name of *pita* fiber or *pita* flax, the appearance and properties of

the fibers being very similar, as well as those also of the fibers of the species of *yucca*. The fiber of the pineapple is, in some countries, very frequently twisted into fishing-lines, and made into nets and into ropes intended for immersion in water, being very little liable to injury from this cause. Abundant as the plant is in its native regions, and now so perfectly naturalized as to form thickets in many parts of the old world, there seems no limit to the quantity of this fiber which might be procured.—The pineapple cloth of the Philippines is called *pina muslin* and *batiste d'ananas*. It is also sometimes erroneously called *grass-cloth*. "With a magnifier, the fibers may be seen to be very numerous and fine, but not twisted at all, as in grass-cloth or the finest muslins and cambrics." The Philippine pineapple fiber is obtained from a species called by the Spaniards *pigna* or *pina* (a cone), and which has by botanists been named *bromelia pigna*, although some regard it as a mere variety of the pineapple, with small and rather dry fruit. It grows in great abundance in the Philippine islands, and is cultivated by the Chinese near Singapore, and the fiber exported to China. This fiber is prepared also in Malacca, Java, Celebes, etc. When bleached, the pineapple fiber can be spun like flax. A patent for this has been taken out in Britain by Mr. Zincke.

The WILD ANANAS (*bromelia pinguin*) of the West Indies, the *bromelia karatas*, common in South America, the *B. saganaria*, common in some parts of Brazil, and the *billbergia variegata*, which grows in wild luxuriance in Mexico, where it is called *caroa*, often covering miles of country—all yield fibers which are used for cloth, cordage, nets, etc. The fiber of *bromelia saganaria* is known as *curratow* fiber. Very strong ropes are made of it.

The genus *bromelia* has a 3-parted calyx shorter than the corolla, and the fruit is succulent. The species are pretty numerous, the leaves of all of them are more or less characterized by spiny serratures: The fruit of *B. pinguin*, already mentioned, affords a cooling juice, which is used in the West Indies mixed with water, to make a drink for patients in fever and dysentery. It is said to be diuretic. A vinous liquor is sometimes made from it.

BROMIC ACID is the only known compound of bromine and oxygen. It is prepared by acting upon bromine (Br) by caustic potash (KO), when much bromide of potassium (KBr) is formed, accompanied by bromate of potash (KBrO₃), a compound of potash and B. acid. It likewise combines with silver, lead, and mercury, yielding salts, all of which are styled bromates.

BROMIDES, the salts of bromine combined with various radicals, such as potassium, sodium, iron, mercury, and others. Alkaline B. crystallize in cubes or right angled prisms, and are easily soluble in water. Bromide of potassium is a universal somnific, and is taken in doses of 20 to 60 grs., or even more. B. are said to be useful in epilepsy.

BROMINE (Greek, *bromos*, disagreeable smell: symb. Br; equiv. 80; spec. grav. 2.96), one of the chemical elements, occurs in combination in sea-water to the extent of about 1 grain to the gallon. It is found more abundantly in certain saline springs, especially those at Kreuznach and Kissingen in Germany. It is also present in water and land plants and animals. In the extraction of B. from concentrated sea-water, from which common salt has been separated in quantity, and which is then called *bittern*, or from salt springs, the liquor—which contains the B., as bromide of magnesium (MgBr)—has a stream of chlorine gas (Cl) passed through it, which forms chloride of magnesium (MgCl), and liberates the bromine. The liquid thus becomes of a more or less yellow tint, and if it be then agitated with ether, and allowed to settle, the latter floats up the bromine. The ethereal solution is then treated with potash, which principally forms bromide of potassium (KBr), and fixes the B., so that the ether may be distilled off. The residue is then treated with oxide of manganese and sulphuric acid in a retort with heat, which results in the liberation and distillation of pure bromine. It exists as a deep red liquid of density 2.966 (nearly 3), which readily evolves red fumes of a very irritating and suffocating nature. It is very poisonous, actually destroying the animal tissues. It is sparingly soluble in water, more so in alcohol and ether, and its water solution possesses great bleaching properties. When raised to the temperature of 145.4° F., it boils, and reduced to 95° F., it becomes a red crystalline solid. B. combines with great rapidity with metals, occasionally with ignition, as with antimony, and forms a class of salts. Treated with hydrosulphuric acid, B. yields hydrobromic acid (HBr), which is the analogue of hydrochloric acid, as B. is of chlorine.

BROMLEY, a t. in England, 10 m. s.e. of London, on high ground n. of the Ravensbourne river. Besides modern institutions there is a college founded in 1666, by bishop Warner, for the residence and support of widows of clergymen. There is also a palace for the bishop of Rochester, to whom the manor has belonged since the time of Ethelbert; and in the garden attached is St. Blaize's well, which was of great fame before the reformation. Pop. of parish in '71, 10,674.

BROMOFORM, the ter-bromide of formyl, analogous to ido-form and chloroform; a heavy, volatile liquid; syn. CHBr₃.

BROMSEBRO, a village of Sweden, in the län, and 27 m. s. of the town, of Calmar. It is celebrated as the place where treaties were entered into between Sweden and Denmark in 1541, 1641, and 1645.

BROMSGROVE, a market t. of Worcestershire, England, near the small river Salwarp, 12 m. s. w. from Birmingham. It is $1\frac{1}{2}$ m. e. from a station on the Birmingham and Bristol railway. The Birmingham and Worcester canal also passes near it. It is situated in a highly cultivated and richly wooded valley. The principal street is about a mile in length. There is a very flourishing grammar-school, founded by Edward VI. in 1553. The linen manufacture was formerly carried on at B.; button-making and nail-making are at present the principal branches of industry. B. returned two members to the house of commons in the reign of Edward I., but was afterwards disfranchised on petition of the inhabitants themselves, because the trade of the town had declined. Pop. '71, 6967.

BRONCHI are the subdivisions of the trachea or windpipe. Opposite the third dorsal vertebra, the latter divides into two branches or B., of similar structure to itself—namely, round and cartilaginous in front; and flat, with muscular and fibrous tissue, behind, lined with mucous membrane. Of these B., one goes to each lung, the right being little more than an inch; the left, about two inches in length. On entering the substance of a lung, the B. divide into smaller branches, which again subdivide, until they are no larger in diameter than one-fiftieth to one-thirtieth of an inch, which give origin to, or terminate in, small polyhedral cells, which seem to cluster round their extremities, and open into them. These are the air-cells; they consist of elastic tissue, with a lining of mucous membrane, and beneath the latter, a layer of minute blood-vessels of the lung. See RESPIRATION, ORGANS AND PROCESS OF.

BRONCHITIS, or inflammation of the lining membrane of the bronchial tubes, is a disease of very common occurrence in Great Britain, and one of the greatest importance, for, if neglected, it not only destroys life, but if carelessly treated, may lead to premature and miserable old age. The first symptoms are generally those which distinguish a common cold—viz., shivering, headache, and sense of weariness, with occasional cough; but the cough continues, and recurs in paroxysms; there is a feeling of oppression on the chest, and the person *wheezes* when he breathes. He also breathes more rapidly, six or ten respirations in the minute more than he did when in health, and his pulse is quicker; and the ear applied to his chest, after these symptoms have continued for two or three days, will hear a rattling, as if air was bubbling through thickish fluid, which is the case; he is breathing through an extraordinary amount of mucus secreted by the inflamed lining membrane of the tube. During his paroxysms of cough, this mucus is spit up. If the inflammation extend no further, it is termed *tubular B.*, and is seldom a fatal disease in the first attack; but, as may be expected, it will often extend, or, in some cases, begin in the small tubes—*vesicular B.*—when the symptoms just described will be present, but in a greater degree, the breathing being so embarrassed that the patient can no longer lie down, but requires to sit or stand up, and use all his muscles of respiration. Though he coughs, he spits very little, till about the third day, when he expectorates large quantities of yellow fluid. At last, prostration becomes so complete that he ceases to spit, and dies suffocated by the accumulated mucus, from the fifth to the seventh day. In less severe cases, or those which yield to treatment, the delicate tubes may be permanently injured by the inflammation. They may be thickened, which narrows their caliber; this will prevent the proper passage of the air, and gives rise to wheezing on any exertion, and cough, especially in winter. Moreover, after repeated attacks, one of the tubes may be blocked up entirely, so that the portion of lung to which it ought to conduct air, is no longer filled, and consequently collapses and wastes. This compels the adjacent tubes and air-cells to dilate to receive more air at the expense of their elasticity (emphysema, q. v.); the air cells may even burst, and so by degrees the apparatus for aerating the blood becomes less and less perfect. The treatment of B. must vary with the patient's constitution; but in most cases, counter-irritation, applied through the medium of mustard or hot turpentine fomentations, will be found very useful. These remedies act more rapidly than a blister, and may be frequently repeated. It should be remembered that patients suffering from B. are very easily depressed. Such medicines as ammonia should be given, to promote expectoration, combined with the liquor ammoniæ acetatis, to produce perspiration. In very acute cases, after a brisk purge, salines, with ipecacuanha or squills, may be given, and an emetic will remove accumulations of mucus.

In the B. of old persons, chloric ether will be found very useful, and may be combined with sedatives, as henbane; but opium must be given with great caution, or not at all, as it tends to increase the congestion of the inflamed tubes. The paregoric elixir (compound tincture of camphor) is an old and popular remedy in B., but enough has been said to impress on the reader the danger of tampering with bronchitis. In every case where it is possible, a skilled medical man should be employed, to determine, by the stethoscope, not only the disease but its exact situation; and as it is but too likely to recur at some future period, or symptoms caused by it to appear, a skilled opinion has a permanent value to the patient. See CATARRH.

BRÖNDSTED, PETER OLUF, a learned antiquary, born near Horsens in Jütland, Nov. 17, 1780. On completing his course of studies at the university of Copenhagen, he, in 1806, went to Paris, where he remained two years. He afterwards visited Italy and Greece, where he made excavations which furnished valuable materials for the study of classical antiquity. He died rector of the Copenhagen university in 1842. B.'s principal work is *Travels and Researches in Greece* (2 vols., Paris, 1826). In addition to several smaller archaeological papers, amongst which was one in English, entitled *An Account of some Greek Vases found near Vulci* (Lond. 1832), and another on the bronzes of Siris, which appeared at Copenhagen, 1837, B. also wrote some valuable contributions to Danish history from mediæval Normau manuscripts (2 vols., Copenh. 1817-18), and *Memoirs of Greece during the Years 1827 and 1828* (Paris, 1835).

BRÖNDSTED, or BRÖNSTED, PETER OLUF, 1781-1842; an archæologist, b. in Jütland. He was educated in the university of Copenhagen, and with his friend Koes joined baron Stackelberg's expedition to Greece, where they made important antiquarian researches, and B. as a reward for his share was made professor of Greek in the university of Copenhagen. This professorship he exchanged for the office of Danish envoy at Rome. In 1832, after visiting France, England, Sicily, and the Ionian islands, he returned to Copenhagen and was made director of the royal museum of antiquities and professor of archæology and philology, and ten years later was appointed rector of the university. His death was in consequence of falling from his horse. His principal work was *Travels and Archeological Researches in Greece*.

BRONGNIART, ALEXANDRE, an eminent French chemist and naturalist, born at Paris in 1770, is said to have delivered a lecture on chemistry before he was 15. In 1790, he visited England for a scientific examination of the Derbyshire mines and pottery-works, and, on his return to France, published a *Memoire sur l'Art de l'Emailleur*. Appointed in 1800 director of the porcelain manufactory at Sèvres, he held that office for the remainder of his life, and revived the almost lost art of painting on glass. In his *Essai d'une Classification des Reptiles*, 1805, he established the four divisions of reptiles, and first gave them the names of *saurians*, *batrachians*, *chelonians*, and *ophidiens*. His *Traité Élémentaire de Minéralogie*, published in 1807, at the instance of the imperial university, became a text-book for lecturers. In 1814, appeared his *Memoire sur les Corps Organisés Fossiles nommés Trilobites*, a name which, as well as a basis of classification for those singular *crustacea*, naturalists owe to Brongniart. In 1815, he was elected a member of the academy of sciences of the French institute; he was also a member of the royal and geological societies of London, and of other learned bodies. In 1845, appeared his *Traité des Arts Ceramiques*. He died 14th Oct., 1847.

BRONGNIART, ADOLPHE THEODORE, son of the preceding, author of several botanical works held in high esteem, was born in 1801; in 1833 became professor of botany at the Jardin des Plantes, Paris, and in 1834 member of the academy of sciences. In 1852, he was elected a foreign member of the royal society of London. He died in 1876.

BRO'NI, a t. of northern Italy, in the province of Pavia, about 11 m. s.e. of the town of Pavia, in a beautiful situation at the foot of the Apennines. It has a singular old church, some portions of which date from the 10th century. In its vicinity is the castle of Broni, celebrated in history as the place where prince Eugène obtained a victory over the French in 1703. Pop. about 7000.

BRONN, HEINRICH GEORG, a German naturalist, was born at Ziegelhausen, Mar. 3, 1800, and educated at Heidelberg university, where he devoted himself to the science of forests and natural history. In 1828, he commenced at Heidelberg a course of lectures on the physical and industrial sciences, and in 1833 was nominated ordinary professor of the same. After Leuckhardt's departure from Freiberg, B. was appointed to the zoological lectureship. B. wrote several important scientific treatises. His first was *A System of Antediluvian Conchylia* (Heidelberg, 1824), which was followed by *A System of Antediluvian Zoophytes*. In 1824, he visited the southern countries of Europe; and in 1827, made a second journey to Italy. On his return, he published the results of his journey (2 vols., Heidelberg, 1825-30). In 1834 appeared his most important geological work—*Lethæa Geognostica*; in 1841-49, his *History of Nature*; and in 1850, his *Universal Zoology*, which was the first attempt to develop zoology in its entirety with reference to extinct organisms. B. died in 1862.

BRONNER, JOHANN PHILIPP, 1792-1865; a German authority on wines, their nature and production, on which he published more than a dozen treatises. In 1831, he established a school for teaching wine-culture; and in later years, under a commission from Baden, he traveled and investigated in all the grape-growing countries of the continent.

BRONTÉ, a t. in the province of Catania, Italy, situated at the western base of Mt. Etna, about 22 m. n.w. of the city of Catania. B. has manufactures of woolen and paper, and the district produces oil, almonds, wine, etc. But the town is celebrated chiefly for its connection with admiral lord Nelson, who was created duke of Bronté by the Neapolitan government in 1779, with an annual income of 6000 *oncie* (about £3750), Pop. '72, 14,589.

BRONTË, CHARLOTTE, one of the most distinguished of modern novelists, was born at Thornton, in the West Riding of Yorkshire, on the 21st of April, 1816. Her father, a clergyman of Irish descent, removed, with six young children and an invalid wife, from Thornton to Ilworth, in the same county, in 1821. Soon after their arrival, Mrs. Brontë died, so that Charlotte, trying hard in after-life, could but dimly recall the remembrance of her mother. Her father, eccentric and solitary in his habits, and full of extravagant theories for making his children hardy and stoical, was ill fitted to replace a mother's love. When Charlotte was eight years old, she was sent with three of her sisters to Cowan's Bridge school, which, whether deservedly or not, had an unfortunate notoriety conferred upon it 25 years later in the pages of *Jane Eyre*. Her two eldest sisters falling dangerously ill, and dying a few days after their removal thence, and the low situation evidently disagreeing with Charlotte's health, she was sent home when little more than nine, and remained there, "the motherly friend and guardian of her younger sisters," till, in 1831, she was sent to Miss Wooler's school at Roe Head, where her remarkable talents were duly appreciated by her kind instructress, and friendships formed with some of her fellow-pupils that lasted throughout life. A few years later, she returned to Miss Wooler's school as teacher there, and also had some sorrowful experiences as governess in one or two families. It was with a view of better qualifying themselves for the task of teaching that Charlotte and her sister Emily went to Brussels in 1842, and took up their abode in a *pensionnat*. When Charlotte returned home in 1844, a new shadow darkened the gloomy Yorkshire parsonage. Her father's sight was declining fast, and her only brother was a source of continual anxiety. It now seemed plain that school-keeping could never be a resource, and the sisters turned their thoughts to literature. Their volume of poems was published in 1846; their names being veiled under those of Currer, Ellis, and Acton Bell, but it met with little or no attention. Charlotte's next venture was a prose tale, *The Professor*, and while it was passing slowly and heavily from publisher to publisher, *Jane Eyre* was making progress. In the Aug. of 1847, it was submitted to Messrs. Smith & Elder, and published by them two months later. It took the public by storm. It was felt that a fresh hand, making new harmonies, was thrown over the old instrument. Henceforward, Charlotte B. had a "twofold life, as author and woman." Over the latter the clouds closed thicker and thicker. Mr. Brontë had indeed recovered his sight; but the sister Charlotte so intensely loved, and whose genius she ever delighted to exalt above her own, Emily—the Ellis Bell of *Wuthering Heights*—died in 1848. Her only brother also died in the same year; and Anne, the youngest of the family, following in 1849, Charlotte was left alone with her aged father in that dreary deserted home among the graves. Nevertheless, her energy never flagged. *Shirley*, begun soon after the appearance of *Jane Eyre*, was published in the autumn of 1849; and *Villette*, written under the frequent pressure of bad health and low spirits, came out in 1852. In the spring of 1854, Charlotte B. was married to her father's curate, the Rev. A. Nicholls, who had long known and loved her. It is a relief to find that a little bright sunshine was permitted to the close of a hitherto clouded life. It was, however, but brief; for serious illness set in, and on the 31st of Mar., 1855, she died. A fragment of an unfinished novel appeared in the *Cornhill Magazine* for April, 1860. See Mrs. Gaskell's *Life of C. B.* (1857).

BRONZE is a reddish-yellow, fine-grained alloy of copper and tin, in variable proportions. It was early known, and what is usually spoken of as *brass* in regard to the ancient nations, was in reality bronze. The brass or B. referred to in the Bible was probably composed of copper and tin, though some translators consider it likely to have been copper alone. The examination of the most ancient coins and metallic ornaments and implements leaves no doubt as to the acquaintance of the ancients with B.; so much so, that in the antiquarian history of European nations, there is a distinct period styled the *bronze period* (see next art.). At the present time, B. is largely used for house and church bells, Chinese gongs; ordnance or cannon metal, and speculum or telescope metal. In the preparation of the various kinds of B., great care must be taken to keep the tin from being burned away or wasted. To obviate this, it is customary to use much old B., as worn-out cannon, etc., and when that is fused in the furnace, to add the new copper and tin. The best Cornish and Banca tin are employed for the better kinds of castings, especially where strength of alloy is required. For inferior work, old scrap tin, which often contains lead, is used; and where strength of material is not an object, a little zinc and lead are added. In either case, during the fusion of the mixed metals in the furnace, at a high temperature, as little air as possible must be admitted to the furnace, otherwise the metals are oxidized, and the alloy is deteriorated. B., when well made, is, excepting gold, platinum, and some of the rare metals, the most durable metallic material with which we are acquainted; and this, coupled with its extreme hardness, rendering it difficult for time and ordinary wear and tear to efface inscriptions or medallions stamped on it, has led the mint in France, some years ago, to issue a bronze coinage in place of copper; and for the last twelve or fifteen years bronze coinage has taken the place of a copper coinage in Great Britain.

The principal varieties of B. have the following average composition:

		Copper.	Tin.
	Brass ordnance or bronze cannon.....	9	1
	Bronze for toothed wheels.....	10	1
	“ for mathematical instruments.....	12	1
	“ for bearings of machinery.....	8	1
	Chinese gongs and cymbals.....	5	1
	Musical bells.....	6	1
	House bells.....	4	1
	Large bells.....	3	1
	Telescope or speculum metal.....	2	1
Ancient.	Mirrors.....	2	1
	Hard bronze.....	7	1
	Medium bronze.....	8	1
	Soft bronze.....	9	1
	Flexible bronze nails.....	20	1

Recently, B. has been deposited on small statues and other articles, in greater or less thickness, by the electrotype process (see GALVANISM), forming very pleasing ornaments at a cheaper rate than ordinary B. ornaments can be purchased for. The same process has been suggested for coating those parts of machinery which are liable to rust.

BRONZE, AGE OF (Dan. *Bronzealderen*), a term used by many modern archæologists to distinguish the second of the three successive periods into which, as they hold, the primitive or pre-historic antiquities of a country may be divided. They take for granted that among a rude or savage people, stone, being more easily fashioned, would come into use before any kind of metal; and that of metals, copper, being oftener found ready for the hammer, would come into use before iron, which has generally to be smelted before it can be wrought. These assumptions—which, in so far, are only in accordance with what has actually been observed among uncivilized races—have obtained from a very early date. Lucretius, writing in the century before the Christian era, has recorded them with his usual vigorous precision:

Arma antiqua, manus, ungues, dentesque fuerunt,
Et lapides, et item sylvarum fragmini rami:
Posterius ferri vis est ærisque reperta:
Et prior æris erat quam ferri cognitus usus.
De Rerum Natura, v. 1282.

Man's earliest arms were fingers, teeth, and nails,
And stones, and fragments from the branching woods;
Then copper next; and last, as later traced,
The tyrant iron.—*Mason Good's Translation.*

More than one antiquary of the last century appears to have suggested the distribution of archæological objects into eras of stone, of copper or bronze, and of iron. But the proposed classification received scarcely any attention until about forty years ago, when it was adopted and developed by Mr. C. J. Thomsen, superintendent of the ethnographical and archæological museum of Copenhagen, in his *Ledetraad til Nordisk Oldkyndighed* (Kjöbenhavn, 1836), and by Mr. Nilsson, professor of zoology in the university of Lund, in Sweden, in his *Skandinaviska Nordens Urineonare* (Lund, 1838-43). According to the theory of these writers—which is held by almost all archæologists in Denmark, Sweden, and Norway, by many in northern Germany and in Switzerland, and by a few in other parts of Europe—the first three stages in the progress of a nation from barbarism to civilization are as clearly identified and defined by their relics of stone, of bronze, and of iron, as the comparative antiquity of geological strata, or periods of the world's creation, is determined by the fossils which they are found to contain.

The name of the "age of stone" is given to the period when weapons and implements were made of stone, amber, wood, bone, horn, or some such easily wrought material, and during which very little or nothing was known of metals. During this era, the people, few in number, and savage in their habits, clothed themselves chiefly with skins of animals. They buried their dead in large sepulchral chambers, covered by what have been called *cromlechs*, or girdled round by the unhewn stone pillars called "Druidical circles." The bodies have most frequently been found unburned, and often with rude urns beside them.

During the "age of bronze," weapons and implements were made of copper or of bronze, and iron and silver were little or not at all known. The dead were burned, and their ashes kept in urns, or deposited in stone-chests, which were covered by conical mounds of earth or heaps of loose stones. In the urns, articles of gold and amber are found, but never of silver. Most articles of metal appear to have been cast; where marks of the hammer appear, it is contended that the forging or beating must have been done by a stone hammer upon a stone anvil.

The "age of iron" is the name applied to the third and last of the three supposed periods. During this era, it is conceived that iron displaced bronze in the manufacture of weapons and implements, and that silver and glass came into use. The dead were still occasionally burned; but they were frequently buried without burning, often seated on chairs, and, at times, with a horse in full war-harness laid beside the body of his master.

The Scandinavian and German antiquaries admit that their three periods run, more or less, one into another; that stone weapons continued to be used throughout the age of B.; that B. and gold were not unknown in the age of stone; and that weapons of stone and B. continued to be used in the age of iron. This admission obviously detracts very much from the practical value of the classification for chronological or other scientific purposes. But the late Mr. J. M. Kemble, and other British antiquaries, have taken objections to the classification altogether, as irreconcilable with generally admitted facts, when carried out to its strict and necessary consequences. They point to the every-day discovery of objects of stone, B., and iron, in the same ancient urns, graves, and dwellings. They instance the case of the Huns, who had swords of iron, while they pointed their arrows with bones; the case of the Anglo-Saxons, who fought with stone mauls at Hastings; and the case of the Germans, who used stone hammers in the thirty years' war. They show stone weapons, in some of which the traces of metal are still fresh, while others attest for themselves that they could not have been cut but by a thin sharp metal point.* They prove from Greek and Roman writers that the nations of the n. and w. of Europe used iron weapons during what must have been their B. age. And they repudiate the proposed appropriation of different modes of burial to the different ages—a point on which the supporters of the theory appear to be hopelessly divided among themselves—on the ground that graves assigned to the B. period have been found to contain more iron than B., and that other supposed characteristics of sepulchers of the B. age are quite as common in sepulchers of the iron age. But although the threefold classification of the Scandinavian and German archaeologists cannot be relied upon for historical uses, it may be accepted as a very convenient mode of arranging archaeological objects. It has been adopted, with some modifications, in the gallery of British antiquities in the British museum at London, in the national museum of the antiquaries of Scotland at Edinburgh, in the museum of the royal Irish academy at Dublin, and in other collections, where the articles are classed, for the most part, according to the materials of which they are made.

BRONZE-WING, BRONZE-WINGED PIGEON, and BRONZE PIGEON, names given in the Australian colonies to certain species of pigeon (see PIGEON and COLUMBIDÆ), chiefly of the genus *peristera* of Swainson, on account of the lustrous bronze color with which their wings are variously marked. They are otherwise also birds of beautiful plumage.—The COMMON B. or bronze-winged ground dove (*columba* or *peristera chalconota*) is distributed over all the Australian colonies. It is often seen in flocks, feeds on the ground, and builds its nest chiefly on low branches of trees growing on meadow-lands or near water. It is a plump bird, often weighing fully a pound, and is acceptable at every table.—The BRUSH B. or little bronze pigeon (*C.* or *P. elegans*) is not so plentiful nor so widely distributed, chiefly inhabiting Tasmania and the southern parts of Australia. It inhabits low swampy grounds, never perches on trees, resembles a partridge in its habits, and makes a loud burring noise like a partridge when it takes wing on being alarmed.—The HARLEQUIN B. (*C.* or *P. histrionica*) is found in the n.w. parts of New South Wales in great flocks, feeding on seeds.—Some of the species of *geophaps*, another of the genera or sub-genera of the *columbidæ*, are also sometimes called bronze-wing. Their partridge-like appearance and habits have gained for them the name of partridge pigeon (q. v.).

BRONZING is the process of covering plaster or clay figures, and articles in ivory, metal, and wood, so as to communicate to them the appearance of ordinary bronze. Several of the materials employed are of little value, whilst others are expensive. Thus, *gold powder* is used for the finer work, and is prepared by grinding gold-leaf with honey on a stone slab till a very fine state of division is attained, then washing out the honey, and drying the gold powder. Inferior gold-leaf, or that which contains much silver and copper, yields the *German gold powder* employed in bronzing. *Copper powder* is prepared by introducing an iron bar or plate into a solution of copper, when the latter metal is precipitated as a finely-divided red powder. *Mosaic gold*, or *muséum*, is made by fusing 1 lb. of tin, introducing $\frac{1}{2}$ lb. mercury, allowing the alloy or amalgam to cool, then pulverizing and grinding up with $\frac{1}{2}$ lb. sal-ammoniac, and 7 ozs. sublimed sulphur. Ultimately, the whole is subjected to the process of sublimation, when the tin, as a brilliant yellow powder, resembling gold, is left in the subliming vessel. The color of mosaic gold may be deepened by the addition of red oxide of lead, and it then assumes a copper tint. *Gold size* is prepared by heating 1 lb. of linseed oil, and gradually adding 4 ozs. of gum animi in very fine powder. When boiled sufficiently, it assumes the consistence of tar, and may then be strained through cloth. When employed in bronzing, some vermilion is added, to make it opaque, and turpentine,

* M. Frederic Troyon, of Lausanne, one of the Swiss antiquaries who accept the three periods of their Scandinavian brethren, instances certain stone axes (now in the collection of baron Renberg, at Prague), which were found, along with their cores, at the site of a primitive manufactory of these weapons in Bohemia. "These cores," he says, "when replaced in the holes from which they had been taken (easily verified by the corresponding veins of the stone), left so little play-room, that it was evident they could only have been detached by a metal point, and not by a hollow cylinder, which could not have given to the hole its conical form, now quite apparent. Instead of the soft iron which is employed nowadays in such operations, the ancients used copper or bronze; and, of course, water and silicious sand were likewise employed in the process."

to make-it thin and limpid enough to be easily laid on the plaster cast or other article with a brush, and the object may ultimately be rubbed over with soft chamois leather, which is occasionally dipped into the gold size. The other B. powders are best laid on with a solution of gum-arabic or isinglass, either of which acts as a cement.

Gun-barrels are bronzed by acting upon them with the chloride or butter of antimony (*bronzing salt*), or with hydrochloric or nitric acids, when the surface of the iron gets partially eaten into, and covered with a thin film of oxide; after which the gun-barrel is thoroughly cleaned, oiled, and burnished. A brownish shade is thus communicated to the barrel, which protects it from rust, and at the same time renders it less conspicuous to an enemy or to game. In the bronzing operation known as the Damascus, the barrel is treated with dilute nitric acid and vinegar, to which sulphate of copper has been added. The result is, that metallic copper is deposited irregularly over the iron surface; and when the latter is washed, oiled, and well rubbed with a hard brush, a very pretty appearance is communicated to the barrel. Articles in wood that require to be bronzed, are first coated with a mixture of size and lampblack, and dried, and then a bronze powder, consisting of very finely-divided patent yellow, raw umber, pipe-clay, lampblack, and Prussian blue, is put on with a brush. After being dried again, the article is burnished with cloth or leather, covered with a layer of Castile soap, and, lastly, cleaned up with a woolen cloth. Copper vessels, coins, etc., are bronzed by heating them in a copper boiler containing vinegar, with 2 parts of verdigris, 1 of sal-ammoniac dissolved in it, when, after sufficient boiling, a pleasant reddish-brown hue is imparted. Bronze and copper articles may have an antique appearance communicated by applying a solution of sal-ammoniac 1 part, cream of tartar 3, common salt 6, hot water 12, and more or less nitrate of copper, when an ancient greenish hue is obtained.

BROOCH (from a root signifying to pierce; comp. Eng. *to broach*; Fr. *brocher*, to spit, or to stitch; Wel. *broc*, to stab), an ornamental pin or instrument for fastening the dress, consisting for the most part either of a ring or disk or of a semicircle, there being a pin in either case passing across it, fastened at one end with a joint, and at the other with a hook. Brooches were much used in antiquity, and varied in form as much as in modern times. They were worn both by men and women, and with a view both to ornament and use, from the time of Homer to the fall of the western empire. Nay, in the early portion of the middle ages, and even amongst semi-barbarous tribes, the art of making *fibule* seems not only to have flourished, but to have attained marvellous perfection. Many of those found, both in Ireland and in Scotland, are wonderfully beautiful in workmanship, and still more so in design; and it is doubtful whether antiquity has left us anything in the way of personal ornament more perfect than the so-called Hunterston B. It was found in 1830, on the estate of Hunterston, in the parish of w. Kilbride, Ayrshire, near to the scene of a conflict which preceded the battle of Largs, in 1262. It is of silver, richly wrought with gold filigree, and elaborately chased with lacertine and ribbon patterns. It is set with ornaments of amber; diameter, $4\frac{3}{8}$ inches. On the reverse are runes, which have been variously read. Dr. Wilson says, "what is decipherable reads in good Scottish Celtic into what he explains to mean—Malbritha, his friend, in recompense to Maolfriid."—*Prehistoric Annals*. One of the most famous articles of the kind existing in Scotland is the *Brooch of Lorn*, in the possession of Macdougall of Dunolly, near Oban. It is believed to be identical with one torn from the breast of Robert Bruce by Alexander of Lorn, the ancestor of Macdougall, in a personal contest with the king. This interesting article is of silver, about 4 in. in diameter, with a circle of jeweled obelisks.

BROOKE, a co. in West Virginia, in the "Panhandle"—a narrow strip between Ohio and Pennsylvania; 75 sq.m.; pop. '70, 5464. Surface hilly, soil fertile; productions agricultural. The Pittsburg, Cincinnati and St. Louis railroad passes through it. Co. seat, Wellsbury.

BROOKE, FRANCIS J., 1763-1827; a Virginian, an officer in the revolutionary army, speaker of the Virginia senate, and presiding judge of the court of appeals.

BROOKE, HENRY, dramatist and novelist, was born in 1708, in the house of Rantavan, co. Cavan, Ireland. His father was a wealthy clergyman. Young B. was first sent to school to one Felix Somerford, where he so distinguished himself that his tutor, in the fullness of his heart, prophesied that he would play a great part in life. His talent for rhyming first made itself evident here, and it received further development while he resided at Dr. Sheridan's school in Dublin. In 1724, he went to study law in London, and became the chosen friend of Pope and Lyttleton. From the heart of this brilliant literary society he was recalled to Ireland by a dying aunt, who left him guardian of her child, a girl of twelve. B. put the child to a Dublin boarding-school, and married her secretly two years thereafter. Four or five years subsequently, when his wife had borne him three children, he removed to London, and once more became a bright particular star in the galaxy of metropolitan genius. In London, he published a poem, entitled *Universal Beauty*, which Pope admired, and of which he perhaps turned a couplet here and there. Shortly after, B. returned to Ireland; but in 1736, he was again in

London, and was introduced to the prince of Wales, who cultivated his friendship, and made him presents of books and china. About this time, he published his play, entitled *Gustavus Vasa*, full of the noblest sentiments, and the most inconceivable characters. In 1740, B. was taken ill, and returned to his native country, where he published several books, and a tragedy, *The Earl of Westmoreland*, which was performed in Dublin. In his later years he removed to Dublin, and died there in 1783. The sonorous eloquence of his plays has not saved them from oblivion; and his novel, entitled *The Fool of Quality*, is the only work of his which is likely to meet the eyes of modern readers. It was originally published in five volumes, and was greatly admired by John Wesley. A new edition was published in 1859, with a preface by the Rev. C. Kingsley.

BROOKE, Sir JAMES, rajah of Sarawak, and governor of Labuan—a man strongly imbued with the spirit of the old adventurers of the Elizabethan time—was b. at Coombe Grove, near Bath, 29th April, 1803. He early entered the East India army, was seriously wounded in the Burmese war, and returning home on furlough, spent some time in travel on the continent. Shipwrecked on the voyage out to join his regiment, he was unable to reach India before his furlough had expired; his appointments consequently lapsed, and he quitted the service. He now conceived the idea of putting down piracy in the Eastern archipelago, and of carrying civilization to the savages inhabiting these islands. He purchased a yacht, which he manned with about 20 sailors, and after a three years' cruise in the Mediterranean, to test the sea-worthiness of his vessel and the seamanship of his crew, sailed from London for Sarawak, a province on the n.w. coast of Borneo, Oct., 1838. When he arrived there, Muda Hassim, the uncle of the sultan of Borneo, was engaged in a war with some rebel tribes. B. lent his assistance, and in return had the title of rajah and governor of Sarawak conferred upon him, the native governor being forced to resign. B. immediately set about reforming the government, instituted free trade, and framed a new code of laws. The murderous custom of head-hunting, prevalent among the Dyaks, he declared to be a crime punishable with death, and vigorously set about the extirpation of piracy. This was done so draconically as to occasion great dissatisfaction in this country; and the result was, that parliament abolished the "head-money" that had been previously paid for the slaughter of pirates. Certain charges, however, brought against B. in the house of commons, in connection with this matter, were declared by a royal commission to be unsubstantiated. The head-money was received, not by B. and his associates, but by the British ships-of-war that had co-operated with him. On his return to England, B. received a warm welcome, was created a knight commander of the Bath in the year following; and the island of Labuan, near Sarawak, having been purchased by the British government, he was appointed governor and commander-in-chief, with a salary of £2000 a year. In 1857, B., who had been superseded in the governorship of Labuan, but who still acted as rajah of Sarawak for the sultan of Borneo, was attacked at night in his house by a large body of Chinese, who were irritated at his efforts to prevent opium-smuggling, and only escaped with his life by swimming across the creek. The Chinese committed great havoc on his property, but their triumph was short-lived. B. collected some natives, attacked the Chinese, defeated them in several successive fights, and ultimately forced them into the jungle, where they must have perished of starvation. Upwards of 2000 Chinese were killed, and all their flourishing settlements destroyed. Returning to England soon after this, B. lectured in several of the chief towns on the advantages likely to result to this country from a possession of Sarawak, and urged the desirableness of the British government taking it under its protection, as otherwise it was likely to fall into the hands of the Dutch. To enforce this view, an influential deputation waited upon the earl of Derby (then head of the government) in Nov., 1858, but he declined to entertain it. He returned to Borneo in 1861, but visited England again twice before his death, on the second occasion having the satisfaction of seeing the independence of Sarawak recognized by the English government. The town prospered greatly under his regime; he found it a place of some 1000 inhabitants, he left it a town of 25,000; and the exports to Singapore, which, in 1840, amounted to £25,000, were in 1858, £300,000. B. died in 1868; a biography appeared in 1877.

BROOKINGS, a co. in s.e. Dakota, on the border of Minnesota and Big Sioux river, 750 sq. m.: pop. '70, 163, of whom 145 were Indians. There are several large streams and many lakes in the territory.

BROOKITE, a mineral of pure native titanite anhydride. It is found in Perthshire, Scotland. A kind found in the Ozark mountains is known as *arkansite*.

BROOKLIME, *Veronica Beccabunga*, a species of speedwell (q.v.) abundant in ditches, water-courses, and wet places near springs in Britain, common also in most parts of the continent of Europe. It is a perennial plant, with procumbent stems, rooting at the base; leaves on short stalks, elliptical, obtuse, and slightly serrate, both stems and leaves smooth and very succulent; the small blue flowers, in form resembling those of the other Speedwells, in racemes, the stalks of which arise from the axils of the opposite leaves. The leaves and young shoots have a bland or slightly bitter taste, and are a tolerable ingredient in spring salads. They are sometimes sold along with water-cresses. See **CRESS**, **WATER**.—In Scotland, the plant is called *Water Purple*.

BROOKLIME, a European plant growing in wet places, used in salads in England and sometimes sold with water-cresses. There is a similar plant in the United States bearing the same name.

BROOKLINE, a village and township in Norfolk co., Mass., on the Charles river, s. w. of Boston, and on the Boston, Hartford and Erie, and the Boston and Albany railroads. B. is a favorite place of residence for persons doing business in Boston, and a part of the town was annexed to that city in 1870. There is a fine town-house, a good public library, and some notably beautiful churches. Communication with Boston is made also by horse railroads. Pop. about 7000.

BROOKLYN, a city at the w. end of Long Island, in the United States, belonging to New York state, in lat. 40° 42' n., 73° 59' west. It stands at the s. w. extremity of Long Island sound, which is here appropriately known as East river, partly in allusion to the narrowness of its channel and the rapidity of its tide, and partly in contradistinction to North river as a second name of the Hudson. Between B. and New York there are numerous ferries of about three-quarters of a m. in width, on which ply steam-boats every few minutes by day, and every half-hour by night. B. is connected with New York by a suspension bridge nearly half a m. long and 125 ft. above the water. In 1850, the pop. was 96,838; in 1870, 396,099; and in 1875, 482,687. B. was founded by the Dutch in 1625, and in 1776 its neighborhood was one of the principal seats of the revolutionary war. Occupying comparatively elevated ground, B. commands a complete view of the adjacent waters and their shores, while, notwithstanding its inequalities of surface, it consists chiefly of straight streets, crossing each other at right angles. It is divided into wards, and governed by a mayor and a board of aldermen. B. has a very large number of churches (whence it is often called the "city of churches"), several flourishing banks, various literary institutions, and numerous seminaries of education—an ample share, in short, of all that characterizes a wealthy, populous, and intelligent community. It has an immense trade in grain, the warehouses being capable of holding about 12,000,000 bushels. It possesses also a national navy-yard, which embraces 45 acres of land, and magnificent docks, including a wet-dock for the largest vessels, the most extensive in the union.

BROOKLYN (*ante*), the capital of Kings co., N. Y., with 554,696 inhabitants; comprising, under the act of consolidation which went into effect Jan. 1, 1855, Brooklyn, Williamsburg, Green Point, Wallabout, Bedford, New Brooklyn, Bushwick, Gowanus, and South Brooklyn; situated in the northern part of Long island, embracing an area of 16,000 acres, or 25 sq. miles. The city is 8 m. long, with a breadth from 2 to 5 m., averaging 3½ m.; it has a water-front on the East river and bay of New York, 8½ m. in length; is bounded on the n. by Newtown creek; on the s. by the towns of New Lots, Flatbush, and New Utrecht; on the e. by the Queens co. line; and on the w. by the East river and bay of New York. The s. and e. borders are occupied by a broad range of low hills extending into Queens county. Along the shore opposite the lower point of New York, is an irregular bluff known as the "Brooklyn Heights," on which are many handsome residences; it has a very picturesque appearance, especially when viewed from New York, while the rays of the setting sun fall upon the houses. A large portion of the southern part of the city is low and level. Its water-front is entirely occupied by wharves and warehouses. Williamsburg, now called Brooklyn, E. D. (eastern district), includes the thickly-settled portions n. of the Wallabout bay, contains a large number of manufacturing establishments, and has its entire water-front devoted to commercial purposes. Greenpoint lies between Bushwick and Newtown creeks, and occupies the extreme north-western part of the city; it contains large ship-yards and manufactories. South B., lying s. of Atlantic street, has an extensive water-front, and contains large wood, coal, stone, and lumber-yards, numerous planing-mills, distilleries, breweries, plaster mills, foundries, and machine-shops. B. is connected with New York by 13 steam ferries, and the Annex boats leave the foot of Fulton street every 20 minutes for Jersey City and Hoboken. With the remoter part of Long island it is connected by the Long Island and the South Side railroads, and with Coney island, a popular seaside resort, at the s. w. extremity, by a number of steam-car lines during the summer season, while some 26 lines of city railroads, using horse-power, radiate from the ferries to the bounds of the city in every direction. An elevated railroad, on the plan of those erected recently in New York, is now in course of construction, to extend from Fulton ferry to East New York, a post village of New Lots township, on the Long Island railroad; a distance of 5½ miles. The East river bridge, to connect B. with New York, is described under the article BRIDGES. The estimated cost of the bridge is \$13,708,026, and the expenditures up to 31st Dec., 1879, were \$11,216,431, of which amount the city of New York contributed its quota of \$3,800,000. B. is well supplied with pure, soft water, derived from Hempstead hook, Valley, and Springfield creeks; is thoroughly lighted by gas companies; has a large and efficient fire department; and its sanitary and police matters are cared for by the metropolitan boards of health, of excise, and of police, respectively. The total number of deaths registered by the board of health in the 11 months ending Nov. 30, 1879, was 10,651, representing an annual death rate of 20.57 in a thousand. During the same year there were registered 2898 marriages and 9013 births; there were 23,441 arrests; the number of buildings completed was 1128, and 399 were in course of

erection. The assessed valuation of taxable property for 1879 was \$232,925,699, and the annual tax levy, \$5,929,629, making the average rate of taxation \$2.55. The city debt is \$37,565,369.89. The city government consists of a mayor, controller, auditor, treasurer, corporation counsel, tax collector, registrar of arrears, 3 commissioners of city works, 3 commissioners of police and excise, 3 commissioners of fire and buildings, and a board of health; and each of the 25 wards is represented in the board of aldermen. The report of the board of education shows that during the school year ending Sept. 30, 1879, the number of licensed teachers employed in the public schools was 56 males and 1346 females. The whole number of children of school age who attended the 60 public free schools of the city was 98,823.

B. has a number of parks: Washington park occupies the site of Fort Greene, of revolutionary fame; Carroll park is very tastefully laid out; but its chief pleasure-ground, and one of the most superb in the country, is Prospect park, the construction of which was begun in 1866; it now covers, with the adjoining parade-ground, 550 acres. The site is one full of natural beauty; magnificent views, fine forest trees, a fertile soil, and numerous lakes lend to the spot all the charms of rural scenery. Upon the plaza at the main entrance is a magnificent fountain and a bronze statue of Abraham Lincoln. Twenty-five acres have been set apart for zoological gardens, and there is a fine observatory on Lookout hill. There are 11 m. of walks, and 10 m. of roads for driving and riding purposes. The cemeteries of B. are widely known: Greenwood, Cypress Hills, and the Cemetery of the Evergreens, are the principal, while there are several of smaller size and note. In Greenwood are interred about 175,000 bodies, and there are over 2000 monuments; the ground inclosed is 413 acres, situated on Gowanus heights, in the s. part of the city.

The U. S. government bought the site now occupied by the navy-yard, for \$40,000, in 1801, but by subsequent purchases has become the owner of about 200 acres in the neighborhood. The navy-yard occupies nearly 50 acres, inclosed by a high brick wall, and is situated on the s. shore of Wallabout bay. The Directory credits B. with 274 churches, which would seem to justify the appellation of "the city of churches." Of this number there are: Baptist, 27; Congregationalist, 23; Presbyterian, 27; Protestant Episcopal, 36; Reformed church, 15; Lutheran, 14; Methodist Episcopal, 39, besides 7 churches for colored members; Roman Catholic, 42, and the Jews have 6 synagogues. We are limited to a simple reference to a few of the more prominent churches. "St. Ann's on the Heights" is a fine Episcopal church; the general style of its architecture is the middle-pointed gothic. The church of the Holy Trinity is built of brown stone, in the Gothic style, and has a spire 275 ft. high; it is one of the handsomest churches in the country. St. Paul's is constructed of rough-hewn blue granite and sandstone, in Gothic style; it has a front of 75 ft., a depth of 145 ft., and is 67 ft. high in the nave. The church of the Pilgrims is built of gray stone, and inserted in the main tower is a piece of the Plymouth rock; its pastor, Dr. R. S. Storrs, is a noted pulpit orator. Plymouth church, a plain brick building on Orange street, has accommodations for seating 2800 persons, and contains what was until recently the largest church organ in America; Henry Ward Beecher has been its pastor for the last 33 years, and the desire to hear him preach is so great that many pew-holders generously give up their seats to strangers for the evening service. The amount offered for pew-rents during the year 1880 was over \$40,000. A Roman Catholic cathedral is in process of erection on Lafayette avenue, between Carlton and Vanderbilt avenues; it will be a very large and imposing structure. The "Tabernacle" is on Schermerhorn street; the exterior is of brick, with stone trimmings, and the interior is well arranged for seating a large audience; the plan is a large semicircle, the organ in the center of the straight side, with the pulpit immediately in front, giving the speaker command of the entire building, a spacious gallery runs around the entire auditorium. A door at the end of each aisle opens into a wide hall, so that in case of fire the church can be emptied in a very short time; its pastor is the well-known Rev. T. De Witt Talmage. There are nearly 200 private schools and educational institutions in B. Among these are several whose names have now a national reputation. Such are the Packer collegiate institute, and the Brooklyn heights seminary for young ladies; the Adelphi academy, the Collegiate and Polytechnic institute for boys, and the juvenile high-school. Among the principal buildings are the city hall, the Kings co. court-house, costing, with the adjacent grounds, \$1,200,000; the Kings co. savings-bank, the church charity foundation, the new B. orphan asylum, the college of St. John the Baptist, the art building, the academy of design, and the Long Island historical society, now being built of terra-cotta, at the corner of Clinton and Pierpont streets. The academy of music, on Montague street, was built in 1860, costing \$206,000; it contains seats for 2300 persons; is built of handsome brick with Dorchester stone trimmings; 232 ft. long, 92 ft. wide, and 56 ft. high. Opposite is the B. library, a handsome model of what the home of a library ought to be. The building was completed in 1867, at a cost of \$227,000; the library now numbers 58,000 volumes, and Mr. S. B. Noyes, the librarian of the institution, has the credit of organizing a catalogue system that has been highly praised for its thorough and convenient method of reference. The Kings co. penitentiary is on Nostrand avenue; its expenses for 1879 were \$101,171.75; its earnings, \$92,917.04; and it contained 2000 prisoners. The two principal theaters are the Park theater, on Fulton street, opposite the city hall park, and

the Brooklyn theater, corner of Johnson and Washington streets, on the site of one which was destroyed by fire Dec. 6, 1876, causing the death of over 300 persons; the new structure has proper means of exit, and is called Haverly's Brooklyn theater. There are 21 hospitals, dispensaries, and infirmaries, besides numerous other benevolent institutions. Among these are the Long Island college hospital, St. Mary's and St. Peter's hospital, the female orphan asylum, the marine hospital, and the Graham institution for the relief of aged women.

B. is the headquarters of the 2d division of the national guard of the state of New York, consisting of the 5th and the 11th brigades; this force consists of the 13th, 14th, 23d, 32d, and 47th regiments of infantry, 3 troops of cavalry, and 3 batteries of artillery.

The streets, with the exception of Fulton street, the principal thoroughfare, are generally straight, have a width of from 60 to 100 ft., and cross each other at right angles. Myrtle and Atlantic avenues are, next to Fulton st., the most active business thoroughfares, and contain many stores that carry on a large trade. The large number of persons who reside in B. and do business in New York has caused the city to be termed facetiously a "big bedroom;" in fact, although its own industrial and commercial activity is very great, by far the larger part of the city is devoted to private dwelling-houses. Clinton avenue is beautifully laid out with handsome residences surrounded by ornamental grounds, and it would be difficult to find in any city a street more attractive of its kind. From a point between the Catherine and Fulton ferry slips to the Gowanus district extends along the entire river front an almost unbroken line of storehouses. The Atlantic dock warehouses of South Brooklyn opposite Governor's island cover a space of 20 acres, and inclose a basin 40 acres in area. Here most of the grain brought from the west is handled, stored, and transhipped. The capacity of the grain warehouses is estimated at 12,000,000 bushels; and about 25,000 vessels, exclusive of canal boats and lighters, are said to be annually unloaded. The principal articles are molasses, sugar, grain, coffee, oil, hides, and wool. The annual storage of merchandise in B. is valued at \$261,000,000. Among the numerous manufacturing establishments of B. are the following: Prentice's hat factories; the Brooklyn brass and copper company; the New York agricultural works; the American steel company's works; the printing house and book manufactory of D. Appleton & Co.; the great sugar-refineries of the eastern district; Peter Cooper's glue factory; Kalbfleisch's chemical works, etc.

The first settlement of Brooklyn, formerly Breuckelen, dates from 1636, when a few Walloon colonists took up their residence on the spot that still bears the name of Wallabout. English and Dutch settlers followed: and in 1667, a patent or charter was granted to the town by governor Richard Nicholls. The first church had been erected the previous year. In 1698, the population amounted to only 509 persons, of whom 65 were slaves. In 1776, the site of the present town was the scene of the battle between the Americans and the British, usually known as the battle of Long Island. In 1816, Brooklyn was incorporated as a village, and in 1834 it became a chartered city. Williamsburg attained the rank of a village in 1827, and was recognized as a city in 1851. The population of B. was in 1800, 3298; in 1820, 7175; in 1830, 15,292; in 1840, 36,233; and in 1850, 96,850. In 1860, after its consolidation with Williamsburg, the population had increased to 266,661; in 1870, to 396,099; in 1875, to 482,493; and according to the U. S. census of 1880, B. has 554,696 inhabitants.

BROOKS, a co. in s. Georgia bordering Florida; 550 sq. m.; pop. '70, 8342—4231 colored. The Atlantic and Gulf railroad intersects. Productions, cotton, corn, etc. Co. seat, Quitman.

BROOKS, CHARLES SHIRLEY, novelist and journalist, was the son of Mr. William Brooks, an architect, and was b. at Brill, in Oxfordshire, about the year 1820. B. was educated chiefly by the late Rev. T. J. Bennett, canon of St. Paul's; and upon leaving school, was articled to an attorney. Upon serving out his time, he passed with distinction the examination in the law society's hall. Literature, however, had more charms for him than the law, and he had not long been settled in London, before he tried the experiment of living by it as a profession. He wrote dramas—*Our New Govern-ess*; *Honors and Tricks*; *The Creole*; *The Daughter of the Stars*; and he contributed at the same time to some of the leading periodicals and journals. An introduction to the editor of the *Morning Chronicle* procured him a steady engagement as writer of the parliamentary summary for that journal. He was also sent by the proprietors of the *Chronicle* on a mission into Russia, Syria, and Egypt, to report on the condition of labor and the poor in those countries; and the results of his observations appeared in a series of letters in that journal. B. was also a contributor to *Punch* from the commencement of that periodical. The "Essence of Parliament" in *Punch* is said to have been regularly contributed by him. He also wrote for it "Miss Violet and her Offers;" "The Negletons," etc. B. also contributed political and other articles to the columns of the *Illustrated London News*. As a novelist, B. is a graceful and pleasing writer, and therefore deservedly popular. He is author of *Aspen Court*; *The Gordian Knot*; *The Silver Cord* (originally published in *Once a Week*); and *Sooner or Later*. B. is likewise author of *The Russians of the South*. He acquired a reputation as a lecturer. On the death of

Mr. Mark Lemon, in 1870, B. became the editor of *Punch*. He died in 1874. A volume of his *Wit and Humor* appeared in 1875.

BROOKS, CHARLES TIMOTHY, b. Mass., 1813; graduated from Harvard, and in 1837 settled in Newport as a Unitarian minister. Most of his time was devoted to literature, especially to German translations. He published Schiller's *William Tell*; *Homage to the Arts*; *German Lyrics*; *Songs of the Field and the Flood*; a translation of Goethe's *Faust*; and many less important works; besides a volume of sermons, various poems, and a prose romance.

BROOKS, ERASTUS, brother of James, b. Maine, 1815; graduated at Brown university, and became teacher of a grammar school and editor of the *Haverhill Gazette*. In 1836, he was a Washington correspondent for several papers, and soon after became associated with James in the New York *Express*, where he remained as assistant and as chief editor until about 1877. He was a leader in the American party, and their candidate for governor of New York (but not elected) in 1856. He was in the state senate of 1856, where his advocacy of the bill to divest Roman Catholic bishops of their title to church property involved him in a controversy with bishop Hughes, which at the time attracted much attention. Mr. B. has been for several terms in the legislature.

BROOKS, JAMES, 1810-73; b. Maine; a journalist and politician. He graduated at Waterville college, and was principal of a Latin school in Portland; became a writer of letters to various newspapers, and originated the idea of regular correspondence from Washington. As a member of the Maine legislature in 1835, he proposed a survey for a railroad from Portland to Quebec or Montreal. In that year he made a tour of Europe on foot, sending his observations to the *Portland Advertiser*. In 1836, he established the *New York Express*, published both morning and evening, which still survives as a prominent evening newspaper. In 1847, he was a member of the state legislature, and in 1845 was elected to congress. During the native-American excitement, 1841-44, his paper was strongly in favor of that party. In 1850, he favored the compromise measures of Henry Clay, and after the outbreak of the civil war he left the party with which he had been so long identified, and was immediately returned to congress by the democrats. In 1871, after a rapid trip abroad, he published *A Seven Months Run Up and Down and Around the World*.

BROOKS, JOHN, LL.D., 1752-1825; an American patriot who, on hearing of the affair at Lexington, marched to the place from Reading with a company of minute-men just in time to see the British in retreat. He served in the war, and was frequently promoted. After the peace, he resumed the practice of medicine at Medford, and in 1816 was elected governor of Massachusetts, and re-elected annually until 1823, when he refused to be longer a candidate.

BROOKS, MARIA GOWEN, 1795-1845; b. Mass.; an American poetess, by Robert Southey called "Maria del Occidente." She lost her father when young, and was protected and educated by her future husband, a Mr. Brooks, a merchant of Boston. After his death, she went to Cuba, and in 1830 visited London and Paris. Some of her works are *Judith*, *Ether*, and other Poems; *Zophiel*, or the *Bride of Seven*; *Idomen*, or the *Vale of Yumuri*; and *Ode to the Departed*.

BROOKS, PETER CHARDON, 1767-1849; a successful business man of Massachusetts; in boyhood on a farm; engaged in marine insurance in Boston, where he made a fortune; for several years president of the New England insurance company. After retiring from business, he was active and liberal in benevolent enterprises. As a member of the legislature he did what he could toward the suppression of lotteries.

BROOKS, PHILLIPS, b. Mass., 1835; graduate of Harvard, and from 1859 to 1870 rector of Episcopal churches in Philadelphia; in the latter year becoming rector of Trinity church, Boston. He is celebrated as a pulpit orator, and as a vigorous and independent thinker. His freedom from the ordinary sectarian trammels, his liberal views of doctrine, with his profound convictions as to vital Christian truths, and his deeply spiritual yet intensely practical preaching, give him great popular power.

BROOKS, PRESTON S., 1819-57; graduate of South Carolina college; was in the state legislature, and served in the war with Mexico. In 1853, he was a member of congress, and was re-chosen in 1854. May 22, 1856, he assaulted senator Sumner, striking him over the head with a cane while in his chair in the senate chamber, and severely injuring him. The house of representatives did not expel him, though a committee reported in favor of doing so; but he resigned, only to be immediately re-elected by his constituents. He died suddenly of inflammation of the throat before the close of the second month of his term.

BROOM, a name given to a number of species of shrubs of the closely allied genera *cytisis*, *genista*, and *spartium*, of the natural order *leguminosæ*, sub-order *papilionaceæ*—all of them having long slender branches, along which are produced axillary flowers. The genera differ in the form of the standard (see *PAPILIONACEÆ*), which is roundish in *spartium*, broadly ovate in *cytisis*, and oblongo-ovate in *genista*, whilst *spartium* has also an acuminate keel, and that of *cytisis* is very obtuse, that of *genista* being oblong and not wholly including the stamens and pistil. The legume is many-seeded in all, the

calyx 2-lipped, and the filaments united in a tube.—Common B., *cytiscus scoparius*, the trivial name being from the Lat. *scopæ*, long twigs, or a besom—which has by different botanists being ranked in each of the genera just named, although it possesses the characters above assigned to *cytiscus*, but has recently been made the type of a new genus, under the name of *sarothamnus scoparius* or *communis*—is a well-known native of Britain and of the continent of Europe, growing in dry soils, and ornamenting hedgebanks, hills, and bushy places, in May and June, with its large yellow flowers, which are on short stalks, drooping, solitary, but produced in considerable number along the straight slender branchlets. The whole aspect of the plant is graceful. The lower leaves have three oblong leaflets, the upper ones, or bracts, are simple; the branches are angular and of a very dark green, very tough, and much in use for making besoms. They have also been used for tanning and dyeing; and their fiber has been woven into a coarse strong cloth, and even made into paper. The whole plant is very bitter, with a peculiar nauseous taste and smell when bruised. The young tops and seeds are used in medicine, being powerfully diuretic, and very beneficial in some kinds of dropsy. They are also mildly laxative, and in large doses emetic. They are commonly administered in the form of a decoction. B. inhabits colder climates than furze, reaching to a greater elevation on mountains, and being found beyond the northern limit of furze. It varies in size from a very humble shrub to one of 20 or even 30 ft. in height, and when it reaches this size, the wood is of great value for the finer purposes of cabinet-makers and turners.—Irish B., *cytiscus* or *sarothamnus patens*, not unfrequent as an ornamental plant in British shrubberies, is not at all a native of Ireland, but of Spain and Portugal.—Portugal B., or White B., *cytiscus albus*, a native of the countries bordering on the Mediterranean, is very often planted in Britain as an ornamental shrub, and is much admired for the beauty of its fasciated white flowers, which are produced upon long filiform branches. Its leaves have three leaflets. It sometimes attains a height of 15 or 20 feet.—Spanish B., *spartium junceum*, is a native of the s. of Europe, generally growing in dry soils and rocky situations, and attaining a height of 8 ft. or upwards. Its branches are upright, round, and rush-like, a characteristic of this genus. They are smooth, and bear only a few small simple leaves, which soon drop off. The fiber of the branchlets is much used in some parts of Italy, France, and Spain, for making cloth, ropes, etc. In the s. of France, the plant is cultivated on dry unproductive soils. The branchlets are made into bundles, dried, beaten, steeped, and washed, in order to the separation of the fiber. It possesses medical properties similar to those of the common B.—A white-flowered species, *S. monospermum*, occasionally to be seen in British shrubberies, grows abundantly on the loose sands of the coasts of Spain, and produces a similar fiber. It is mentioned by Barth as growing in great abundance in Africa to the s. of the great desert. Many species somewhat resembling these are occasionally to be seen in Britain among ornamental plants, some of them often in greenhouses. The Canary isles produce some remarkable for the fragrance of their flowers. The name B. is not given to those species of *cytiscus* (q. v.) and *genista* (q. v.) which do not display in a marked degree the character of having long slender twigs.—Butcher's B. (q. v.) is a plant of an entirely different family.

BROOM-CORN, a grass cultivated in North America for the manufacture of brooms and whisks, which are made of the tops of the culms and the branches of the panicle. It is regarded as a mere variety of the same species (*sorghum saccharatum*), of which the shaloo, or sugar-grass (see SUGAR-CANE and DURRA), is another variety. It has been much longer cultivated in North America, however, than the sugar-yielding variety. Its introduction is ascribed to Dr. Franklin, who, seeing an imported whisk in the possession of a lady of Philadelphia, found a single seed on it, and planted it. It is said to have been brought from the East Indies. It is now extensively cultivated in all parts of the United States, and especially by some branches of the religious society called Shakers. The manufacture of brooms is annually becoming of greater importance, much capital being invested in it. The crop of broom-corn has a beautiful appearance when near maturity. It often attains a height of 12 to 15 feet. The stalks are long and hard, and mostly used for manure, although cattle will feed on them before they are touched by frost, and cattle are very fond of the leaves. The seed is used like Indian corn, for feeding poultry, and sometimes for feeding cattle and horses. The usual practice in harvesting broom-corn is to bend the stalks $2\frac{1}{2}$ to 3 ft. from the ground, and leave them a few days to dry, then to cut them over 6 to 8 in. below the panicle, laying the tops in heaps, to be conveyed to the scraper, which is often wrought by horse-power, and which removes the seed from them. Improved machinery has recently begun to be employed in the manufacture of brooms and whisks from broom-corn, and they are therefore produced with much greater rapidity than before. It is supposed that, in 1860, about 10,000 acres of broom-corn were cultivated in the state of New York, 9,000 in Illinois, 6,000 in Ohio, and about an equal amount in all the other states of the Union, or 30,000 acres in all; the value of the produce about \$1,590,000. Great numbers of brooms and whisks of this material are exported to Britain.

BROOME, a co. in s. New York, on the Pennsylvania border; 680 sq. m.; pop. '75, 42,149; in '80, 50,056. It is drained by the Susquehanna, Chenango, Otselic, and other streams, and intersected by the New York and Erie, Albany and Susquehanna, Syracuse

and Binghamton, and Delaware, Lackawanna and Western railroads, and the Chenango canal. Productions agricultural, including an immense quantity of butter. Co. seat, Binghamton.

BROOME, WILLIAM, LL.D., 1689-1745; coadjutor of Pope in translating the *Odyssey*. For writing all the notes and translating eight books of the Greek text, B. received \$2500; but Pope loved money, and when the small price became notorious it annoyed the poet so that he abused B. in the *Dunciad* and in the *Bathos*. B. published a *Miscellany of Poems*, and translated some of Anacreon's odes. He was a rector in Suffolk.

BROOMRAPE. See **OROBANCHEÆ**.

BROOMS. See **BRUSHES AND BROOMS**.

BRORA BEDS are a series of strata occurring at Brora, a village in Sutherlandshire, of the same age as the inferior oolite of Yorkshire. They are chiefly remarkable for the occurrence in them of a seam of coal of good quality $3\frac{1}{2}$ ft. thick, being the thickest stratum of true coal hitherto discovered in any secondary strata in Britain.

BROSSES, CHARLES DE, a learned French historian, was b. at Dijon, Feb. 8th, 1709. His first work was *Lettres sur l'Etat de la Ville d'Herculanum*, the result of a tour through Italy in 1739. At the suggestion of his friend Buffon the naturalist, he wrote the *Histoire des Navigations aux Terres Australes* (1756), in which he described the supposed great southern continent under the several names of Magellania, Australia, and Polynesia. The last two of these names, now commonly used, were first employed by B. His next work was *Du Culte des Dieux Fétiches*, etc. (1760). It was followed by a *Traité de la Formation Mécanique des Langues* (1765), which, in spite of many errors, contains not a few novel and ingenious observations and conjectures. During the greater part of his life, B. was occupied in endeavoring to supply the lacunes in the works of Sallust; and having collected about 700 fragments by this historian, he published, with such interpolations as he deemed necessary, the *Histoire de la République Romaine dans le cours du Septième Siècle, par Salluste* (1777). B. died as president of the parliament of Burgundy, May 7, 1777. His letters from Italy, under the title *Italie il y a cent Ans*, were edited and republished by his son René, count de Brosse, in 1834.

BROTH is an infusion or decoction of vegetable and animal substances in water. It is customary to use more or less meat, generally ox-flesh, with bone, and certain vegetables, as cabbage, greens, turnips, carrots, pease, beans, onions, etc. The whole are mixed together in cold water, heat slowly applied, and the materials allowed to simmer for some hours. The meat yields up certain ingredients, whilst others are retained in the residual flesh. The following table will illustrate this.

Ox-flesh heated with water

Yields to the Water.

Albuminous matter.
Gelatine.
Kreatine.
Extractive matters or osmazome.
Lactic acid.
Salts.
Fat.
Saccharine matter.

Leaves in the Boiled Meat.

Fibrin.
Coagulated albumen.
Gelatinous tissue.
Fat.
Nervous matter.

The vegetables yield albuminous constituents, coloring and mucilaginous matter, and volatile oils and salts.

The real nutritive material present in B. is less than is generally thought, though it aids in satisfying the cravings of the appetite. To invalids, however, the form of B. known as beef-tea (q. v.) is of great importance, as it affords the weak and sickly stomach a light palatable article of diet at a time when stronger food would do the weakened system much harm. See **NUTRITION**.

BROTHERHOODS, RELIGIOUS. These were societies instituted for pious and benevolent purposes, and were numerous in the middle ages. Their origin is probably to be traced to the desire which then prevailed to imitate the spiritual orders. They were usually founded at first without ecclesiastical authorization, on account of which, several of the confraternities that either did not seek or did not obtain the recognition of the church, assumed the character of sects, and were suspected of heresy. To this class, among others, belonged the Beghards and Beguines (q. v.), the Brothers and Sisters of the Free Spirit (see below), the Apostolic Brethren (q. v.), the Flagellants (q. v.), who, tolerated by the church for a while, at last incurred its displeasure, and were severely persecuted. We may also reckon among religious B. the old building corporations, from which sprang the order of Freemasons, the religious character of whose secret societies indicated, in the opinion of the church, a peculiarly dangerous gnosis and symbolism. Others coming into existence under ecclesiastical oversight, or at least being confirmed by the church, had no *arcana*, but were simply dedicated to the promotion of religion, either by the imposition of new penances, the acceptance of new and severer devotions, or the assisting of strangers, travelers, the unprotected, the oppressed, the destitute, and

the sick. Nor can we refuse our admiration and approbation to such self-denying fraternities, when we remember how defective were the early communities in charitable institutions. They were most numerous in Italy, Rome alone boasting more than a hundred.

BROTHERS AND SISTERS OF THE FREE SPIRIT, a sect which sprang up in the Rhine country during the 13th c., and afterwards spread into France and Italy. It grounded its peculiarities on the biblical doctrine that the Holy Spirit is a spirit of "freedom." Misunderstanding the true nature of spiritual freedom, the members of this sect conceived themselves released not only from the thralldom of the church, but also from the obligations of morality. They set aside the marriage-tie, and indulged in licentiousness. A few even maintained that the deeds of the body could not possibly affect the soul. Intellectually, they are said to have been given to Pantheism. The synods of Cologne in 1306, and of Treves in 1310, decreed their suppression, and in the persecutions which ensued, they appear to have been completely dispersed.

THE BRETHREN OF SOCIAL LIFE, BRETHREN OF THE COMMON LOT, or BRETHREN OF GOOD WILL (also called **HIERONYMITES** and **GREGORIANS**, from Hieronymus and Gregory the great, whom they claimed as patrons), a fraternity founded about 1376 by Geert Groote (b. at Deventer, 1340, d. 1384) and Florentius Radewin (b. 1350, at Leerdam, in s. Holland, d. 1400). This society—which professed to be a copy of the earliest Christian communities, and was in several respects a forerunner of the subsequently formed societies of United Brethren, now sometimes styled Moravians—was composed of persons who sought after pious and spiritual exercises without any conventional distinctions of order, etc. Community of goods, ascetic habits, industry, care of the education of young persons, and the use of the vernacular language in divine service, were some of the chief points insisted on by the brethren, who were not fettered by monastic or any other vows. Perfect community of goods was a rule of their societies. Despite the persecutions which they suffered from the mendicant friars, they were recognized and sanctioned by several popes and by the council of Constance. They became most numerous in the Netherlands and n. Germany, but also spread themselves in Italy, Sicily, and Portugal, so that, in 1430, they reckoned more than 130 societies. The last was founded at Cambray in 1505. Several brotherhoods of Gregorians assisted in the reformation. In other cases, their institutions fell into the hands of the Jesuits. Though the original founders of these societies were opposed to all learning and science which was not purely moral and practical, their followers rendered most important services to popular education, having free schools in connection with many of their houses, supporting students at other schools, and distributing useful books. They have, indeed, been not incorrectly described as pioneers of the reformation. After the revival of learning in Italy, the Brethren of Social Life entered into the spiritual activity of the time. The most important and distinguished members of the society were Gerhard Zerbold of Zütphen, Thomas-à-Kempis, and the learned cardinal Nicholas Cusa.—Female societies, of a similar character, sprung up at the same time with those of the Brethren of Social Life. At the head of each was a superior or directress, who was styled the *Martha*.

BROTHER JONATHAN, a synonym for the people of the United States, as "John Bull" is for the people of England. When Washington took command of the revolutionary forces in New England, he found an immediate necessity for arms and other war materials, Jonathan Trumbull was then governor of Connecticut, a man of excellent judgment, and a highly esteemed friend of Washington. It happened that at an important council of officers where the wants of the service were the topic under consideration, Washington remarked, in reference to some knotty question: "We must consult Brother Jonathan," meaning governor Trumbull. The expression was repeated on occasions of difficulty, and before the war closed it was established as a convenient name for the whole people.

BROTHERS, a name given to a group of six or eight rocky islets immediately outside the strait of Bab-el-Mandeb, varying in height from 250 to 350 feet. They lie off the African coast about 9 m. s. of the island Perim, now occupied by England. Of the loftiest point, the lat. and long. respectively are 12° 28' n., and 43° 22' e.—Brothers is also the name given to three isolated mountains near the coast of New South Wales, between Harrington inlet to the s., and Port Macquarie to the n., or between lat. 32° and 31½° south. They are valuable as landmarks.

BROTHERS, LAW OF DESCENT AMONG. In the law of England, this was immediate, without reference to the parent as the *commune vinculum*; but by the 3 and 4 Will. IV. c. 106, s. 5, it is enacted that no brother or sister shall be considered to inherit immediately from his or her brother or sister, but every such descent shall be traced through the parent. See **INHERITANCE**.

BROTHERS, LAY, an inferior class of monks, not in holy orders, but bound by monastic rules, and employed as servants in monasteries (q. v.).

BROTHERS, RICHARD, a fanatic, whose prophecies and writings excited an unusual sensation in his day, was at one time a lieutenant in the British navy, which he quitted in 1789. Refusing, from conscientious scruples, to take the requisite oath to enable him to receive his half-pay, he was reduced to great distress, and ultimately placed in the

workhouse. Dating his first call from 1790, he announced himself, in 1793, the apostle of a new religion, "the nephew of the Almighty, and prince of the Hebrews, appointed to lead them to the land of Canaan." In 1794, he published a book, in two parts, entitled *A Revealed Knowledge of the Prophecies and Times*, etc.; and, in 1795, an *Exposition of the Trinity*. He was the author of several other publications, marked by a strange mixture of reason and insanity. In consequence of prophesying the death of the king, and the destruction of the monarchy, he was committed to Newgate, but soon liberated. Some of his political predictions, especially in reference to the state of the continent, were either altogether or partially fulfilled; and many persons were induced to sell their goods, and prepare to accompany him to his New Jerusalem, which was to be built on both sides of the river Jordan, where he was to arrive in the year 1795. His disciples were not confined to the poor and ignorant, but even men of ability and education were deluded into believing in him, two of the most eminent being Nathaniel Brassey Halhed, esq., M.P., the orientalist, and Sharp, the celebrated engraver. As a dangerous lunatic, he was at length, by order of government, committed to Bedlam, but released April 14, 1806, and died Jan. 25, 1824.

BROTHERS AND SISTERS OF CHARITY. Under these names, there exist in the Roman Catholic church two widely ramified beneficent societies, for the nursing of the poor and sick in hospitals, without distinction of faith, rank, or nation. The order of the brothers of charity, or Compassionate Brothers, was established in 1540, at Seville, in Spain, by the Portuguese John di Dio (died 1550), who had served in Africa under Charles V. The funds for the purpose were obtained by begging. The primitive object of the society was the care of the sick, and the reformation of women of immoral character: it was composed of lay-members, under no rule. In the year 1572, the order received the papal recognition, and was subjected to the rule of St. Augustine. All the privileges of the mendicant orders were conceded to it in the year 1624, and it was then divided into a Spanish congregation, with a maj.gen. in Granada, and an Italian or extra-Spanish congregation, with a maj.gen. in Rome. To the latter belong also the brothers of charity in Switzerland, Germany (where Austria is their chief seat), Poland, the Netherlands, France, and other countries. The European members of the order clothe themselves in black; the extra-European, who are under a separate gen. of their order in America, wear brown. Their services to distressed humanity continue to be held in high estimation. The sisters of charity, formerly also, on account of their dress, called *gray sisters*—independent associations of unmarried Christian females, for the alleviation of human suffering, especially for the tending of the sick and the poor—were first called into existence in France, in 1634, by Vincent de Paul (born 1576), greatly assisted by the noble-hearted and self-devoted widow, Le Gras, by birth De Marillac. The society was recognized in 1655 by Clement IX., and in 1685 already numbered 224 convents. The French revolution sorely interrupted the abundant and benevolent labors of the sisters of charity by the suppression and proscription of their convents in France; but Napoleon restored the order in 1807 by the convocation of a general chapter of the scattered sisters, under the presidency of the empress mother, and by the grant of the necessary funds; and there exist at present more than 300 associations in France, where, in the villages, elementary education is in great part conducted by them. They attend the sick in all the great hospitals. There exists in Germany a Roman Catholic association of unmarried females, not bound by conventual rules, and possessing the right of withdrawing from the association at pleasure, but placed under a strict supervision, and occupied in the same duties as the sisters of charity. The institute of deaconesses (q.v.) in the Protestant churches of the continent of Europe is of a very similar character.

BROUGHAM, HENRY, Lord BROUGHAM AND VAUX, was b. in Edinburgh, 19th Sept., 1778. His father, Mr. Henry Brougham, was the descendant of an ancient family in Westmoreland, and his mother, Eleonora Syme, who was a woman of much talent, was a niece of Robertson the historian. B. received his education at the high school, and afterwards at the university, of Edinburgh. He gave early promise of future ability, some mathematical papers written by him at the age of eighteen having been considered worthy of publication in the transactions of the royal society. He spent some time in traveling on the continent, and in 1800 was admitted to the Scotch bar. In company with Jeffrey, Horner, and Sydney Smith, B.'s first public efforts were given to the service of the *Edinburgh Review*, and he contributed to it some of its most powerful articles. His liberal political views excluded him from the hope of promotion in Scotland, and a character which he had acquired for eccentricity and indiscretion, excluded him from all legal practice, except the unremunerative practice of the criminal courts. After seven years of vain attendance in the courts at Edinburgh, he betook himself to a field more worthy of his ambition, and in 1808 passed at the English bar.

In London, B. first attracted public notice by the admirable appearance he made at the bar of the house of commons, when he was employed on behalf of certain Liverpool merchants to ask the repeal of the orders in council. Soon after this, in 1810, he entered parliament, and within a few months of the time of taking his seat, brought in and carried his first public measure—an act making participation in the slave-trade felony. He was welcomed by the opposition leaders, to whose party he had attached himself, as a

most powerful assistant in their attacks upon the government. B. succeeded in carrying the repeal of the obnoxious orders in council shortly before the general election of 1812, and then ventured to contest, along with another whig, the membership for Liverpool against Canning and another tory. He was defeated, and remained without a seat in parliament till 1816, when he was returned for Winchelsea, and again became an active member of the opposition. By this time he had also established some reputation in the courts of law. He never, indeed, acquired a very large practice, but he repeatedly distinguished himself by speeches of great vigor and ability in the defense of persons prosecuted for libel by the crown. His most famous appearance as an advocate, however, was in defense of queen Caroline, when, along with Denman, he defended the injured queen with unequalled courage and disinterestedness, at the cost, as both well knew, of exclusion, for years to come, from all professional advancement. But his eloquence and boldness, though they forfeited for him the favor of the crown, gained him that of the people, and for the ten years between 1820 and 1830, B. was the popular idol. He made no bad use of his power. In 1822, he used it, though in vain, in support of a scheme of national education; and to his activity is owing, in great measure, the establishment of the London university, of the first mechanics' institute, and of the society for the diffusion of useful knowledge. In 1830, B. delivered a most powerful speech against slavery, and in consequence of it—as he himself believed—was invited to stand, and returned, as member for the great popular constituency of the co. of York. The aristocratically disposed whigs would—had they dared—have excluded B. from the reform ministry; but, in addition to having enormous popularity, he was virtually their leader in debate in the commons, and was thus, in spite of his unmanageableness, indispensable. After various intrigues, B. was offered, and was persuaded, against both his interests and his inclinations, to accept a peerage and the chancellorship. He took his seat in the lords in Nov., 1830, and assisted very materially in carrying through that house the great measures then proposed by the liberal ministers. He shared in the general unpopularity which afterwards attached to them, and when they were dismissed by William IV. in 1834, B. left office, never to return to it. After that time, he held in the upper house a position as nearly analogous as may be to that formerly held by him in the commons, criticising freely the conduct of successive administrations, and steadily forwarding every measure for social progress.

It will be as a law-reformer that B. will be best remembered. He took up Romilly's uncompleted task of carrying into practice the ameliorations suggested by Bentham. His efforts in this direction began as early as 1816, when he introduced into parliament a bill to remove various defects in the law of libel. In 1827, in a memorable speech which occupied six hours in delivery, B. enumerated the defects in nearly every branch of English law, and made proposals for dealing with law-reform on a proper scale. These, as might have been expected, met with little encouragement. It has been the fortune of many of his measures to be carried afterwards, in a mutilated form, by other hands. After he left office, B. also succeeded in carrying various reforms in the law, among which may be noted some very extensive changes in the law of evidence. Among the measures proposed by B., but left for future law-reformers to carry, were bills for the codification of the criminal law, for the establishment in England of a system of public prosecutors, and for the giving of compensation to parties acquitted. Lord B.'s acts and bills, as well those regarding the slave-trade, education, and other public questions, as those touching on law-reform, have been collected and published by sir J. E. Eardly Wilmot (Lond., Longman, 1857). The large well-filled volume which they form is the most fitting monument that could be preserved of the activity, perseverance, and public spirit of the man.

As an orator, more especially as a debater in parliament, B. was, among the men of his time, inferior only to Canning. He was wont, however, to indulge in his speeches in too large an admixture of exciting elements: argument was mingled with fiery declamation; ridicule, sarcasm, invective, were freely used; and these he dealt out with a vehemence and energy that at times carried him far beyond bounds. The power of ready, rapid, and forcible diction was eminently his. In many other fields besides oratory, B. has won a high reputation. He cultivated mathematical and physical science with success, and ventured upon the domain of metaphysics, and even of theology. His miscellaneous writings are of great extent, and upon an almost incredible variety of subjects. They were, however, intended more to serve purposes of the moment, than as permanent additions to our literature; and though they display great powers of rapid comprehension and nervous clear exposition, it cannot be said that we are indebted to their author for any new truths in politics or morals, or any original discoveries in science. The honors due to men of letters B. did not fail to acquire, having successively been made lord rector of Glasgow university, president of university college, London, member of the institute of France, chancellor of the university of Edinburgh, and lastly, D.C.L. of Oxford.

Lord B. took a warm interest in legal and social reform. While not engaged in parliament, he resided chiefly at Cannes, in the s. of France, where he died May 7th, 1868. His lordship married, in 1819, Mary Anne Eden, the granddaughter of a baronet in the co. of Durham. The issue of this marriage was two daughters, who both died before reaching womanhood. The patent of the title to the peerage was extended to make it

descend to the family of his brother. B. left a memoir of his life and times, which was published in 3 vols. (1871).

BROUGHAM, JOHN, b. Ireland, 1810, d. N. Y., 1880; studied surgery for a considerable time, but was obliged to leave school on account of adversity, and went to London, where he proposed to enter the East India service; but an old man gave him a guinea, and urged him to seek some fitter employment. Happening to meet an old acquaintance, he got an engagement in the prince of Wales theater, and there in July, 1830, he acted six parts in the old play *Tom and Jerry*. In 1830, he was a member of the company organized by Madame Vestris. About this time he wrote his first play, a burlesque, prepared for William E. Burton, then acting in London. In 1840, he was a member of the Lyceum, for which theater he wrote a number of plays. He came to the United States in 1842, and appeared in the old Park theater in New York city. Soon after he joined Burton's company in Chambers street; and here also he wrote a number of plays, among which were *Vanity Fair*, *All is Fair in Love*, *Dombey and Son*, and the *Irish Emigrant*. Afterward he managed Niblo's Garden, and in Dec., 1850, he opened Brougham's Lyceum on Broadway, where he produced *David Copperfield*, and a new version of the *Actress of Padua*, the latter written for Charlotte Cushman. He then connected himself with Wallack's company, in which he remained until 1860; then managed the Bowery theater, reviving *King John* with superb scenery. Meanwhile he was writing plays, among which were *Game of Love*, *Bleak House*, *A Decided Case*, *Game of Life*, *Playing with Fire*, *Pocahontas*, *Love and Murder*, *Romance and Reality*, etc. After several seasons at Wallack's, he rejoined Burton and produced his burlesque of *Columbus*, and other plays. In 1860, he went to England, where he remained five years, and there too he was writing and adapting plays, among them the *Duke's Motto*, for Mr. Fechter. He reappeared in New York in Oct., 1865, and not long after again joined Wallack's company, with which he remained until the close of his life. Among his later plays are *John Garth*, and *The Lily of France*.

BROUGHTON, JOHN CAM HOBHOUSE, Lord, 1786-1869; an English statesman. At his death the peerage became extinct, as he left no male issue. In his school days at Cambridge he was the intimate friend of Byron, and the two made a tour of southern Europe at a later period. He was a radical, and, in 1816, wrote a book to correct certain current misrepresentations of the events of the *Hundred Days in Paris*. The work gave great offense both in England and France. The translator and printer in Paris were sentenced to fine and imprisonment for an "atrocious libel," and in London he was confined in Newgate nearly three months. As a martyr to toriyism, he tried for parliament in the borough of Westminster, but was defeated, though chosen by a large majority only two years later. For 12 years he was an ardent and courageous advocate of liberal measures, among them the repeal of the test and corporation acts, and Roman Catholic emancipation. In 1831, he became a baron, and in the same year was secretary of war in the Grey ministry. Subsequently he was chief commissioner of woods and forests, and president of the board of control. In 1851, he became a peer, and ceased to participate in public life. Lord B. published *Imitations and Translations from the Classics; Journey through Albania with Lord Byron; and Historical Illustrations of the Fourth Canto of Childe Harold*.

BROUGHTY-FERRY, a t. of Forfarshire, on the firth of Tay, 4 m. e. of Dundee. Pop. 71,5817. It is connected with Ferry-Port-on-Craig, in Fifeshire, by a railway-ferry over the firth, here a mile broad, which, before the opening of the Tay bridge, formed the chief connection between Edinburgh and Fife with Dundee. It has cod and other white fisheries. Many Dundee merchants occupy fine villas at Broughty-Ferry. On the shore stands an ancient castle, lately repaired as a defense for the Tay.

BROUSSA, or **BOURSA**, the ancient *Prusa*, where the kings of Bithynia usually resided, situated in lat. 27° n., long. 40° e., at the foot of Mt. Olympus, in Asia Minor. Prusa is said to have been built by Prusias, king of Bithynia, who waged war with Cræsus or Cyrus. Seifeddulat, of the race of Hamadan, took it in 336 of the Hegira, but it was retaken by the Greek emperor in 947 A.D. In 1356, Orcan, son of Othman, the second emperor of Turkey, captured it, and made it the capital of his empire, and it continued so until the taking of Constantinople by Mohammed II. in 1453.

B. is most pleasantly situated, facing a beautiful and luxuriant plain, covered for many miles with plantations of mulberry-trees. The city and suburbs are about 6 m. in circumference. The town is divided from the eastern suburb by a deep channel or vale, over which there are several bridges, one of them—with shops on each side—being 90 paces long and 16 broad. The streets are remarkably clean, and the bazaars very good, being supplied with European goods from Constantinople. The pop. of B. amounts to 73,000 souls, of whom about 11,000 are Armenians. It contains a great number of mosques, some of which are very fine buildings. The silks of B. are much esteemed in the European markets, and great quantities are exported every year to France, Constantinople, and Smyrna. The inhabitants manufacture a kind of silk, like satin, mostly striped, which is used for the under-garment of the oriental dress; also a material from silk and flax used chiefly for shirts; and a sort of gauze, called "brun-juke," which is much worn by the Turkish ladies for under-garments. A great quan-

tity of British manufactured goods, such as Manchester "twists," "gray calicoes," "prints," "zebras," etc., are imported into B., the goods being landed at Constantinople, and thence conveyed overland to Broussa. It is the official residence of a Turkish pasha, and the seat of a Turkish tribunal. B. is subject to frequent earthquakes. In ancient times, it was famous for its thermal baths, or "royal waters," as they were called, which still exist.

BROUSSAIS, FRANÇOIS JOSEPH VICTOR, the founder of the school of medicine, was b. at St. Malo, Dec. 17, 1772, and in early life, after studying at Dinon, served for a time first in the navy, and then in the army. In 1820, he was appointed first professor at the military hospital of Val-de-Grace. In 1832, he became professor of general pathology and therapeutics in the faculty of medicine in Paris, and afterwards was made a member of the institute. He died at his country residence at Vitry, Nov. 17, 1838. In 1841, a statue was erected to his memory in the court of Val-de-Grace. B.'s peculiar views are ably explained in his chief works—the *Histoire des Pilegmiasies ou Inflammations Chroniques* (1808), and *Examen de la Doctrine Médicale généralement adoptée* (1816), which assert the following principles: that life is sustained only by excitation; that this excitation may be either too strong (*surrexcitation*) or too weak (*adynamie*), the latter case, however, being far less frequent than the former. These abnormal conditions of surrexcitation and adynamie at first manifest themselves in a specific organ of the body; but afterwards, by sympathy, are extended to other organs; that is, all diseases are originally *local*, and become *general* only by sympathy of the several organs. The organs most subject to disease are the stomach and bowels, and therefore *gastro-enteritis* (inflammation of the stomach and the intestines) is the basis of pathology; consequently, B. resorted to local phlebotomy—especially the application of numerous leeches to the region of the abdomen—as a remedy in fevers and various diseases. His theory and practice gained many adherents in France, who took the name of the "physiological school." But a more exact knowledge of physiology has demonstrated that the views of B. were one-sided and exaggerated. Yet they have not been without use in pathology, as they have led to a more careful study of pathological anatomy and physiological sympathies, and to a more exact observation of the so-called specific morbid processes of which the existence was denied by B. and his followers. Montègre, *Notice Historique sur la Vie, les Travaux, et les Opinions de Broussais*.—His son, CASIMIR B., born 1803, professor at Val-de-Grace (1833), was a zealous adherent of the Broussais system, and is the writer of a work, *Hygiène-Morale*, based on phrenology.

BROUSSON, CLAUDE, 1647-98; a French Protestant, an advocate and legal defender of the Huguenots. His house was the rendezvous of certain leaders of an outbreak, and he was compelled to fly from the city (Toulouse), barely escaping into Switzerland. He ventured into France twice afterwards, at great peril; but in 1697 he was caught, after many escapes, and sentenced to be broken on the wheel on the charge of treasonable conspiracy with the duke of Schomberg to invade France. He was executed accordingly, Nov. 4, 1698. He left a number of works on the subjects of the period.

BROUSSONET, PIERRE MARIE AUGUSTE, 1761-1807; a French naturalist educated in medicine, and a professor at the age of 18. He labored zealously to establish the Linnæan system of botany in France, and visited England, where he was admitted to the royal society, publishing in London *Ichthyologie Deuts I.* In Paris he was perpetual secretary of the society of agriculture, and a member of the electoral college of the city. Subsequently he visited Madrid and Lisbon, and went as physician to an embassy which the United States sent to the emperor of Morocco. Still later he was French consul at Teneriffe; in 1797 a member of the institute, and in charge of the botanical garden at Montpellier. He died of apoplexy soon after his election to the national legislative body. France is indebted to him for the introduction of the Merino sheep and the Angora goat.

BROUSSONETIA. See MULBERRY.

BROUWER, ADRIAN, 1608-40; a Dutch painter. He was apprenticed to Frank Hals, who treated him with great severity, and drove him to dissipation and the low life so well depicted in his works. The best collection of his pictures is in the Munich gallery.

BROWN, a co. in Illinois, on the Illinois river; 320 sq.m.; pop. '70, 12,205. In part prairie and in part wooded, with fertile and well-cultivated soil. It is intersected by the Toledo, Wabash, and Western railroad. Agriculture is the main business. Co. seat, Mount Sterling.

BROWN, a co. in s. Indiana; 320 sq.m.; pop. '70, 8681; well wooded, and with tolerably productive soil. Agriculture is the chief occupation. Co. seat, Nashville.

BROWN, a co. in n.e. Kansas on the Nebraska border; 576 sq.m.; pop. '78, 10,446; in '80, 12,759. The co. is crossed by the St. Joseph and Denver City railroad. Productions, grain, hay, butter, and cattle. Co. seat, Hiawatha.

BROWN, a co. in s. Minnesota, on the Big and Little Cottonwood; 450 sq.m.; pop. '76, 6396. Chief business, agriculture. Co. seat, New Ulm.

BROWN, a co. in s.w. Ohio, on the Ohio river; 502 sq.m.; pop. '70, 30,802; in '80, 32,935. Hilly near the river, but level inland; fertile and well cultivated. Produces grain, butter, sorghum molasses, and some wine. Co seat, Georgetown.

BROWN, a co. in w. Texas, on Colorado river; 1050 sq.m.; pop. '70, 544. Hilly and prairie surface, with rich soil. Chief business, stock raising. Co seat, Brownwood.

BROWN, a co. in e. Wisconsin at the head of Green bay; 525 sq.m.; pop. '70, 25,168. Uneven surface; productions agricultural. The Wisconsin division of the Chicago and Northwestern railroad passes through. Co seat, Green Bay.

BROWN, BENJAMIN GRATZ, b. Ky, 1826; graduate of Yale; made his home in St. Louis, and in 1852 was a member of the legislature. In 1854, he started the *Missouri Democrat*. In the civil war he fought for the union, commanding a brigade. In 1863, he was a United States senator from Missouri, and in 1872 was the democratic candidate for vice-president.

BROWN, CHAD, d. 1665; he left Massachusetts in 1636 because of differences with the leaders of the colony, and settled in Rhode Island, where he became an elder in a Baptist church, and the progenitor of many prominent citizens.

BROWN, CHARLES BROCKDEN, a celebrated American novelist, was b. at Philadelphia, Jan. 17, 1771. His early education was carried on under the care of Mr. Robert Proud, author of the *History of Pennsylvania*. Afterwards he studied for the law, but the license which he had already given to his imagination induced an unconquerable aversion to legal pursuits, and he consequently betook himself to literature. The French revolution exercised on him, as on many other ardent spirits, a considerable influence; several of his writings at this period being penetrated with the new thoughts and sentiments which sprung out of that great convulsion. In 1798, he published *Wieland*, the first of his remarkable fictions; and in 1799, *Ormond*, or *the Secret Witness*. His next production was *Arthur Mervyn*, or *Memoirs of the Year 1793*—the fatal year of yellow-fever in Philadelphia. In 1801, appeared *Edgar Huntly*, or *the Adventures of a Sleep-Walker*, "a romance presenting a greater variety of wild and picturesque adventure, with more copious delineations of natural scenery, than is to be found in his other works."—*Prescott*. This was followed in the same year by *Clara Howard*, and in 1804 by *Jane Talbot*, first printed in England. He died of consumption in 1810.

Besides the writings which have been enumerated, B. composed a number of political pamphlets, contriuted to various literary magazines, and founded three or four periodicals himself. The author who exercised the greatest influence on the development of his genius was Godwin, whom he occasionally imitated, while Godwin himself, on the other hand, acknowledged his obligations to B., and warmly admired him. The most striking quality of his mind is its ingenuity, both imaginative and psychological. He invents incidents and analyzes feelings with remarkable subtlety, but his success is somewhat marred by his extravagant departure from the realities of every-day life.

BROWN, FRANCIS, D.D., 1718-1820; a native of New Hampshire, and graduate of Dartmouth college, of which he became president in 1815. Some of his sermons and pamphlets have been published.

BROWN, Sir GEORGE, a distinguished British gen., b. at Linkwood, near Elgin, Scotland, in Aug., 1790; entered the army in 1806, became lieut. in 1807, and was present in the latter year at the capture of Copenhagen. He served in the peninsular war. At the battle of Talavera he was severely wounded, and at the storming of Badajoz was one of the forlorn-hope. He was appointed maj., May 26, and lieut.col., Sept. 29, 1814, in which year he embarked in maj.gen. Ross's expedition against the United States of America, and was wounded at the battle of Bladensburg. From Feb. 6, 1824, to 1842, he commanded a battalion of the rifle brigade. He was made adj.gen. of the forces, April, 1850, and lieut.gen., 1851. In the Crimean war, 1854-55, B. commanded the light division. At the battle of Inkerman, Nov. 5, 1854, he was severely wounded, and obliged to retire for a short time to Malta. In 1855, he was created a knight commander of the bath. In the expedition to the sea of Azof, he commanded the British troops; and in the first unsuccessful attack on the Redan of Sebastopol, he had the chief command of the storming-party. He was gazetted, April 3, 1856, "gen. in the army for distinguished service in the field." He was a knight of Hanover, received the Turkish order of the Medjidie of first class in 1855; and the grand cross of the legion of honor, 1856. In 1860, he became commander-in-chief in Ireland, and in 1862 a privy-councilor. He died in 1865.

BROWN, GEORGE L., b. 1814 in Boston; an American painter, of whose productions the more notable are "The Crown of New England" (the White mountains), and "The Harbor of New York."

BROWN, GOULD, 1791-1857; a grammarian; b. in Rhode Island; for 20 years a teacher in New York, and author of several elementary and progressive works on English grammar, the most important of which is his *Grammar of English Grammars*.

BROWN, HENRY KIRKE, b. Mass., 1814; an American sculptor, well known for works in bronze. He studied portrait-painting in Boston, and after spending some years in Italy,

settled in Brooklyn, N. Y. He made the first bronze cast achieved in the United States. Some of his figures are "Hope," "The Pleiades," "The Four Seasons," and statues of De Witt Clinton, Washington, Nathaniel Greene, Lincoln, and gen. Scott.

BROWN, HUGH STOWELL, b. 1823; an English clergymen who left the established church and joined the Baptists; he soon became a leader, and is still very popular with the working classes.

BROWN, JACOB, 1775-1828; an American general commanding on the Canadian frontier in the war of 1812; he showed skill and courage in the defense of Sackett's Harbor, and in the battles of Chippewa and Niagara Falls. In 1821, he was chief in command of the United States army.

BROWN, JOHN, D.D., b. 1715-66; an English divine and author; educated at Cambridge; served with distinction as a volunteer in 1745, and was about that time appointed chaplain. He is best known by his writings, such as *Honor*, and *Essay on Satire* (poems); the tragedy of *Barbarossa*, produced by Garrick, followed by "*Athelstone*, a satire on the manners and principles of the time; a *Dissertation on the Rise, Union, and Power, etc., of Poetry and Music*. He was affected with deep melancholy at times, and in the last of these afflictions committed suicide.

BROWN, JOHN, of Haddington, once the most popular, and still among the most revered, theological writers in Scotland, was b. in 1722, at Carpow, near Abernethy, in Perthshire. Deprived of both his parents when only 11 years of age, he became assistant to a venerable and pious shepherd, named John Ogilvie, who tended his flock among the neighboring hills, and nursed the religious ardor of the boy's heart. B., however, aspired to be wise as well as good. His thirst for learning was insatiable, and the most romantic yet well-accredited stories illustrative of this are related by his biographers. While still a friendless "herd laddie," he had made great progress in a self-acquired knowledge of Greek and Latin. The extent of his acquisitions, even at this early time, may be estimated from the fact, that the country people round about believed he was in league with the devil, and that he had pledged his soul for unhallowed lore. At a later period of his life, "he knew nine or ten languages, classical, oriental, and modern, and had amassed vast stores of Puritan, Scottish, and Dutch divinity." After a brief career as a peddler—an employment which English readers will understand from Wordsworth's *Excursion* was neither mean nor degrading—B. became a volunteer in a regiment of militia raised in Fifeshire during the rebellion of 1745, and in 1747, schoolmaster in the neighborhood of Kinross. During the vacations of his school, he studied philosophy and divinity under the inspection of the Associate Synod, and the superintendence of the rev. Ebenezer Erskine and James Fisher. In 1750, he was ordained pastor of the Secession church at Haddington. Perhaps a more faithful, industrious, and holy minister never labored in Scotland. David Hume was once prevailed upon to go and hear him, and the criticism of the great skeptic was: "That old man preaches as if Christ were at his elbow." Although self-educated, he had little of the narrowness which culture so obtained generally brings along with it; he corresponded on friendly terms with Episcopalians, and often expressed a warm affection for all true Christians. Although himself a sound Presbyterian, and a tolerably strict Calvinist, "the love of the Lord" was his real and ultimate test of a man's orthodoxy. In 1758, B. first appeared as an author. His work was entitled *A Help for the Ignorant*, etc. In 1765, he published his famous *Christian Journal*, in which the common events of life are richly but quaintly, and perhaps somewhat artificially, spiritualized. In 1768, he was appointed professor of divinity under the Associate Synod, and in the same year issued his valuable *Dictionary of the Holy Bible*. In 1771, appeared his *History of the Church from the Birth of the Saviour*—a work good enough for cottage-reading, but possessing no merit otherwise; and in 1778, *The Self-interpreting Bible*. This last is B.'s *magnum opus*, and has been amazingly popular in Scotland; even high dignitaries of the English church have praised and recommended it. Besides these works, B. published a great variety of sermons, tracts, etc., which had an extensive popularity. He died on 19th June, 1787.

BROWN, JOHN, M.D., founder of the Brunonian system of medicine, the son of a day-laborer, and himself first intended for a weaver, b. in 1735, in Bunkle parish, Berwickshire, was educated at the grammar-school of Dunse, in which he was subsequently an usher. After studying medicine at the Edinburgh university, he became tutor to the children of the celebrated Dr. Cullen, and assistant in his university lectures. Conceiving himself slighted by Cullen, he commenced giving lectures himself upon a new system of medicine, according to which all diseases are divided into the sthenic, or those depending on an excess of excitement, and the asthenic, those resulting from a deficiency of it; the former to be removed by debilitating medicines, as opium, and the latter by stimulants, such as wine and brandy. His system gave rise to much opposition, but his partisans were numerous; for a time his opinions had some influence. In 1779, B. took the degree of M.D. at the university of St. Andrews, and in 1780 published his *Elementa Medicinæ*. He was also author of *Observations on the Old System of Physic*. In 1786, being overwhelmed with debt, he removed to London, where he died of apoplexy in 1788. His works, with a memoir by his son, Dr. William Cullen Brown, appeared in 1804 (3 vols. 8vo).

BROWN, JOHN, 1736-1803; merchant of Providence, R. I.; the leader of the men who destroyed the *Gaspee*, an English sloop-of-war, June 17, 1772. He was arrested and put in irons, but escaped. He was a member of congress from Rhode Island, and a patron of Brown university.

BROWN, JOHN, 1744-80; graduate of Yale, and king's attorney in New York. In 1775, he was an emissary in Canada to provoke the people against the English government. He was with Allen at the capture of Ticonderoga, and at Quebec when Wolfe was killed. He was killed by Indians while on the way to help Schuyler in the Mohawk valley campaign.

BROWN, JOHN, 1757-1837; b. Va.; soldier in the revolutionary army. He was a student at Princeton and at William and Mary college; and after residing in Kentucky for a few years, returned to Virginia, and represented that state in congress, 1787-93. From 1793 to 1805, he was United States senator from Virginia.

BROWN, JOHN, D.D., grandson of John Brown, of Haddington, was b. 12th July, 1784, near Whitburn, Linlithgowshire. He studied at Edinburgh university, and afterwards at the theological hall of the secession church in Selkirk. In 1806, he was ordained to the pastorate of a church in Biggar, a small town in Lanarkshire, where he labored for 15 years, employing his leisure hours in those studies which subsequently enabled him to take a high rank as a biblical expositor. In 1822, he was transferred to Rose street church, Edinburgh, and in 1829 to Broughton place church in the same city. In 1834, he was appointed professor of pastoral and exegetical theology in connection with the associate synod. He died 13th Oct., 1858. As a preacher, Dr. B. was among the first of his time. For clearness of scriptural exposition, chaste and powerful language, and majestic ardor and earnestness of manner, he had no equal in his denomination, and no superior in Scotland. The attractiveness of his delivery was heightened by a countenance singularly noble, tender, and sweet. Among his works are *The Law of Christ respecting Civil Obedience*; *The Resurrection of Life*; and his important and scholarly *Expository Discourses on the Epistles of Peter, on the Epistle to the Galatians, and on the Epistle to the Romans*. See Dr. Cairns's Memoir (1860).—**JOHN BROWN, M.D., LL.D.,** son of the above, b. 1810, has attained a distinguished place among the medical practitioners of Edinburgh. He has also abundantly inherited the paternal genius, though in him it has taken a literary rather than a theological direction. In 1858, he published *Horæ Subsecivæ*, a volume of essays, most of which had previously appeared in periodicals. One of these, *Rab and his Friends*, has been since published separately, and has obtained a remarkable popularity. It excels in quaint fancy, rich delicate pathos, and abrupt but felicitous diction. A civil list pension of £100 was allotted to Dr. B. in 1876.

BROWN, Captain JOHN, the leader of the Harper's Ferry (U. S.) insurrection (1859), designed to incite the slaves of the southern states of America to rebellion, was descended from a Puritan carpenter, one of the *Mayflower* emigrants, and was b. at Torrington, Conn., in the year 1800. He intended to enter the ministry, but had to abandon his studies on account of weak sight, and subsequently became a wool-dealer. In 1854, having imbibed an intense hatred of slavery, he went to Kansas, in order to vote, and, if need were, fight, against the establishment of slavery in that territory. In many of the conflicts which ensued between the pro-slavery party from Missouri and the free settlers, B. played a prominent part, and in one of these he had a son killed, a circumstance which deepened his hostility against the southern party. After the agitation in Kansas was settled by a general vote, B. traveled through the northern and eastern states, declaiming against slavery, and endeavoring to organize an armed attack upon it. In Oct., 1859, at the head of 17 white men and 5 blacks, he commenced active hostilities by a descent upon Harper's Ferry, a town of some 5000 inhabitants, at the confluence of the Potomac and Shenandoah, and possessed of an arsenal containing from 100,000 to 200,000 stand of arms. The arsenal was easily captured, and 40 or 50 of the principal inhabitants were made prisoners; but instead of retreating at once to the mountains with arms and hostages, as his original design had been—meaning to exchange the hostages for slaves—B. lingered on in the town until the evening, by which time 1500 militiamen had arrived. Next day, an attack was made on his position, which, after some loss of life, was carried. B. was captured, and shortly after was tried for treason, and executed. He is described as a singularly brave and honest man.

BROWN, JOHN, b. Conn. May 9, 1800; d. Dec. 2, 1859; an American abolitionist, celebrated as the originator of the insurrection at Harper's ferry. He was intended for the ministry, but was compelled to give up study on account of inflammation in his eyes. With his family he removed to Ohio, where he worked as a tanner, and engaged in the wool trade, in which he failed. He then went to Essex co., N. Y., and began as a farmer, but in 1854 followed his four sons, who had settled in Kansas, and were subjected to much persecution on account of their opposition to slavery. When the free-state men organized to repel the Missourians who were besieging Lawrence, Brown and his sons were among the foremost on the free-state side; and a little later they made a remarkable defense against vastly superior numbers near Ossawatimie. After many rough adventures in the Kansas troubles, B. formed the project of an insurrection in the south among the slaves as the surest means of securing their liberation. He drilled

a small force in Iowa in the winter of 1857, and the next spring, in Canada, drew up a new provisional constitution for the states, under which he was selected as commander-in-chief, one of his sons, and Richard Reulf and John Kagi, being civil officers. The next important event was the rescue by B. of certain slaves in Missouri who had been sold and were to be taken to Texas, one of the owners of the property being slain in the conflict. Again he went to Canada, returning to the United States in the summer. His attempt to capture the arsenal at Harper's ferry was made on Sunday night, Oct. 16th, 1859. The arsenal was easily seized, several citizens were taken into custody, conspicuous houses were searched for arms, and few of the citizens knew what was going on until mid-forenoon, when they began to rally; some scattered firing followed, one colored man was killed (by Brown's men), the mayor was slightly hurt, and so was one of Brown's sons. There was no sign of a rising of negroes, and before noon Brown and his men were in the arsenal, virtually prisoners. A feeling of rage prevailed so strongly, that a man who came from the arsenal with a flag of truce was instantly killed, and one prisoner was put to death. At night Brown had three un wounded whites and a few useless negroes for his army; one of his sons lay dead, and another was badly wounded. In the morning a force of United States marines arrived, and Brown, fighting desperately to the last, was taken prisoner, being wounded once with a sword, and twice with the bayonet. All of the invaders were indicted for conspiring to incite insurrection, and for murder and treason. After a trial of three days, in which Brown was unable, on account of his wounds, to stand up; he was found guilty, and sentenced to death on the scaffold within 48 hours. He died calmly on the 2d of Dec., 1859. It may safely be assumed that his execution hastened the downfall of slavery in the United States. B. was a man of stern and uncompromising moral principle; and though open to the charge of fanaticism, and regarded as justly and necessarily condemned to death under the law, he seems to be increasingly viewed as a martyr and a hero, offering himself in a blind and unconscious sacrifice as an obstacle in the path of a gigantic social and political wrong.

BROWN, JOHN NEWTON, D.D., 1803-68; b. Conn.; a Baptist clergyman who published an *Encyclopædia of Religious Knowledge*, and *Memorials of Baptist Martyrs*.

BROWN, NICHOLAS, 1796-1841; b. R. I.; the chief patron of Brown university, which in 1804 changed its name in his honor from Rhode Island college. In early life he was a member of the house of Brown & Ives, successful merchants. The gifts of Brown to the university reached more than \$100,000. He also gave \$30,000 to establish an insane asylum in Providence, besides large sums to the athenæum, and to churches, etc.

BROWN, ROBERT, an English clergyman, founder of the sect of Brownists, b. in 1549, the son of Anthony Brown, esq., of Folthorp, Rutlandshire, was educated at Cambridge, and was at first a preacher at Bennet church, then a schoolmaster in Southwark, and a lecturer at Islington. In 1580, he began to attack the order and discipline of the established church, and soon after formed a distinct church on democratic principles at Norwich. Committed by Dr. Freake, bishop of that see, to the custody of the sheriff, he was released from prison through the influence of the lord-treasurer, Cecil, to whom he was nearly related. Having, in 1582, published a controversial work, entitled *The Life and Manners of True Christians*, with, prefixed, *A Treatise of Reformation without Tarrying for Any*, he was again arrested, but, through the lord-treasurer's intercession, again liberated. He afterwards formed several congregational churches; but, with many of his followers, was obliged to take refuge in Holland. In 1589, he returned to England, reconciled himself to the established church, and became rector of a church near Oundle, Northamptonshire. Of a very violent temper, he was, when 80 years old, sent to Northampton jail, for an assault on a constable, and died in prison in 1630. The Brownists continued, notwithstanding the defection of their leader, to subsist as a separate sect for some time both in Holland (among the English there) and in England. In the former country, they were at last absorbed in, or reconciled to, the Presbyterian church in 1701, in the latter, they may be said to have given birth to the Independents (q.v.), who rose into great importance in the 17th century.

BROWN, ROBERT, an eminent botanist, the son of an Episcopal clergyman, was b. at Montrose, Scotland, Dec. 21, 1773, and educated at Marischal college, Aberdeen. Having studied medicine at the university of Edinburgh, he became, in 1795, ensign and assistant-surgeon in a Scottish fencible regiment, with which he went to Ireland. Devoting himself to the study of botany, he resigned his commissions in 1800, and the following year was, on the recommendation of sir Joseph Banks, engaged as naturalist in the expedition sent out under capt. Flinders for the survey of the Australian coasts. On his return, in 1805, he brought home nearly 4000 species of Australian plants, a large proportion of which were new to science. Soon after, he was appointed librarian to the Linnæan society. To the *Transactions* of the Edinburgh Wernerian society and those of the Linnæan society, he contributed memoirs on *Asclepiadææ* and *Proteacææ*, and published *Prodromus Floræ Novæ Hollandiæ et Insulæ Van Diemen's*, vol. i. 1810; a supplement to this work appeared in 1830, relating to the *Proteacææ* only. He also wrote the *General Remarks, Geographical and Systematical, on the Botany of Terra Australis*,

attached to the narrative of capt. Flinders' expedition, 1814. His adoption of the natural system of Jussieu, the French botanist, led to its general substitution in place of the Linnæan method. B.'s numerous memoirs in transactions of societies, and other contributions to botanical science, secured for universal approval the title conferred on him by Alexander von Humboldt of *Bottanicorum facile Princeps*. In 1810, B. received the charge of the library and splendid collections of sir Joseph Banks, which, in 1827, were transferred to the British museum, when he was appointed keeper of the botanical department in that establishment. In 1811, he was elected F.R.S.; in 1832, D.C.L. of Oxford; and in 1833 was elected one of the 18 foreign associates of the academy of sciences of the institute of France. In 1839, the royal society awarded him their Copley medal for his *Discoveries during a Series of Years on the Subject of Vegetable Impregnation*. He was president of the Linnæan society from 1849 to 1853. He died in London, June 10, 1858. A collected edition of B.'s works, in 5 vols. 8vo, has been published in Germany.

BROWN, SAMUEL, M.D., son of Samuel Brown (the founder of itinerating libraries, and grandson of the rev. John Brown of Haddington), was b. on the 23d Feb., 1817, and entered the university of Edinburgh in 1832. He took his degree as M.D. in 1839, and immediately surrendered himself to the magical fascination of chemistry. One idea possessed him to the close of his life—the possibility of reconstructing the whole science of atomics. He never, in spite of crushing failures in experiment, abandoned his early conviction that chemical elements, usually considered simple, might be transmuted into each other. In 1843, he delivered in Edinburgh four critical lectures on the atomic theory. During the same year, he became a candidate for the chair of chemistry in the university of that city; but having periled his claims on the experimental success of his fatal theory, and being again doomed to disappointment, he withdrew his application, and devoted himself with a kind of mournful austerity, and with more than the earnestness of a mediæval alchemist, to the solitary work of his laboratory. In 1850 appeared his *Tragedy of Galileo*, a volume which indicates, but does not embody, the finely imaginative and philosophical genius of its author. B. died of consumption 20th Sept., 1856. His fugitive essays were collected and published after his death; and, though for the most part too comprehensive in their intent, they enable the public to understand why he was held in admiration by men like Hamilton, Ferrier, De Quincey, Wilson, Carlyle, Hare, Jeffrey, and Chalmers.

BROWN, SAMUEL GILMAN, D.D., LL.D., b. Maine, 1813; graduated at Dartmouth college and Andover theological seminary; traveled in Europe; was professor in Dartmouth of oratory and intellectual philosophy; elected president of Hamilton college in 1867, and resigned the position in 1880. He has published a *Life of Rufus Choate; Biography of Self-Taught Men; etc.*

BROWN, SAMUEL R., D.D., 1810–80; b. Conn. His mother was the author of the familiar hymn, *I love to steal a while away*. The family removed in early childhood to Monson, Mass. Dr. B., as an American missionary, founded the first Protestant Christian school in China at which Yung Wing, now a member of the embassy from China to the United States, and chief of the educational commission which has 120 Chinese youths in New England schools and colleges, was educated. Graduated from Yale in 1832, Dr. Brown sailed for China, 1838, and was manager of the Morrison Chinese school for boys, at Canton, 1838–47. He was in the United States, 1847–59; and in 1859, was stationed at Yokohama, Japan, as one of the first missionaries. He is translator of the Bible into Japanese, and of several Japanese books; author of *Colloquial Japanese*, a grammar; *Prendergast's Mastery System*, adapted to the study of English or Japanese; and of many articles on Chinese and Japanese subjects. He returned to this country in feeble health, in 1879, and died in Monson, Mass.

BROWN, THOMAS, 1663–1704; recognized by Addison as "of facetious memory." He was a farmer's son, and entered at Oxford, but was obliged, for his wild conduct, to leave college. In London, after trying teaching, he wrote poems, letters, etc., for his bread. His works are witty, but coarse, and often indelicate. He would lose his friend sooner than his joke.

BROWN, THOMAS, a Scottish metaphysician, son of the Rev. Samuel Brown, was b. in 1778, at the manse of Kirkmahreck, Kirkcudbrightshire. After being some time at school in England, he went to Edinburgh in 1792, and for several years attended the lectures of Playfair, Black, Robison, and Dugald Stewart. He began the study of law, but shortly abandoned it for medicine; and having taken his diploma of M.D., in 1803, he became (1806) the partner of Dr. Gregory in his large practice. But his strong bent was for literature and philosophical speculation. At the age of 18, he had published a refutation of Darwin's *Zoonomia*; was a member of an academy of physics, or society for "the investigation of the laws of nature," formed in 1797, and embracing the names of Erskine, Brougham, Leyden, Jeffrey, Smith, and others; and contributed at the outset to the *Edinburgh Review*. In 1804, appeared his essay on *Cause and Effect*, in which he holds that there is nothing in a cause but the fact of immediate and invariable antecedence to the change called its effect. Dugald Stewart, professor of moral philosophy in the university, being obliged, from bad health, to retire in 1810, got Dr. B. appointed

assistant and successor, which office he continued to discharge till his death, in 1820. He was popular as a professor; and his *Lectures*, published after his death, have gone through a great many editions, though of late they have somewhat fallen out of notice. He also wrote a good deal of poetry, which is now forgotten. Dr. B. attempted to overturn the psychological system of his predecessors, Reid and Stewart, and to substitute a new and simplified scheme of mental phenomena. The greater part of this new philosophy was the production of his first session as professor, the writing of each lecture being begun on the evening previous to its delivery. A philosophic system thus improvised could not but be crude and inconsistent, however acute and imaginative its author might be. B.'s chief contribution to psychology is the establishment of a sixth or *molecular sense*.

BROWN, ULYSSES MAXIMILIAN; 1705-57; after studying at Limerick, Rome, and Prague, he entered the Austrian army, serving with distinction in Corsica and Italy, and rising rapidly in rank. In 1739, he was field-marshal lieutenant, and one of the aulic council. He was field-marshal in the seven years' war, repulsed the Prussians at Lowowitz, and was mortally wounded in the great battle of Prague.

BROWN, WILLIAM, founder of the free public library at Liverpool, b. at Ballymena, Ireland, in 1784; was educated at Catterick, near Richmond, Yorkshire; and in his 16th year accompanied his parents to the United States. Employed in the counting-house of his father, who was engaged in the linen trade in Baltimore, in a few years he was admitted a partner. Returning to England in 1809, he established a branch of the business at Liverpool, and laid the foundation of one of the largest mercantile firms in the world. Embarking in the American trade, he became an extensive importer of cotton, and by his rare energy, quick business habits, and sterling integrity, soon became distinguished for the magnitude of his dealings. A liberal reformer, he took a prominent part in local and public affairs, and unceasingly promoted the education of the people. In 1844, he contested s. Lancashire upon the anti-corn-law league interest without success, but was returned to parliament for that division of the country in 1846, and was subsequently three times re-elected. A series of letters in defense of free-trade, which, in 1850, he contributed to the *Pennsylvanian* (Boston newspaper), attracted much attention. He was also an able advocate for the adoption of a decimal coinage. In 1857, he munificently subscribed £30,000 for the establishment of a free public library at Liverpool, and the noble building erected for the purpose owes its existence entirely to his generosity. He died in 1864.

BROWN, WILLIAM LAWRENCE, 1755-1830; minister of the English church at Utrecht, and successor of his father and uncle. He was also professor of moral philosophy and ecclesiastical history in the university, to which was added a professorship of the law of nature. After the French revolution he escaped to England, and at a later period became principal of Marischal college, Aberdeen. In 1800, he was chaplain to the king, and in 1804 dean of the chapel royal. His best known works are *Essay on the Natural Equality of Man*; *On the Existence of the Supreme Creator*; and on the existing religions with regard to their moral tendency.

BROWN COAL, a mineral substance of vegetable origin, like common coal, but differing from it in its more distinctly fibrous or woody formation, which is sometimes so perfect that the original structure of the wood can be discerned by the microscope, whilst its external form is also not unfrequently preserved. In this state, it is often called *wood coal*; and it sometimes occurs so little mineralized, that it may be used for the purposes of wood, as at Vitry, on the banks of the Seine, where the wood-work of a house has been made of it. From this to the most perfectly mineralized state, it occurs in all different stages. It is often brown or brownish-black, more rarely gray. It burns without swelling or running, with a weaker flame than coal; emits in burning a smell like that of peat, and leaves an ash more resembling that of wood than of coal. Wherever it occurs in sufficient abundance, it is used for fuel, although very inferior to common coal. *Bovey coal*, so called from Bovey Tracey, in Devonshire, where extensive beds of it occur, and where it has long been wrought, is B. C., and often exhibits the woody structure very beautifully. B. C. occurs in a number of other places in Britain, and more abundantly near Paris, and in Liguria and Hanover, where it forms thick beds in alluvial deposits.—The *surturbrand* (q.v.) of Iceland is regarded as a variety of it. *Jet* (q.v.) is also sometimes regarded as a variety of brown coal. Although bearing the name coal, B. C. is rather a kind of *lignite* (q.v.) than of coal.

BROWNE, CHARLES FARRAR, an American humorist, better known as "ARTEMUS WARD," was b. in Waterford, Me., in 1836, and graduated from the free village school into a printing-office—the American boy's college. As a printer's boy, he worked in all the principal towns in New England, until settled at Boston, where he began to write comic stories and essays. A roving disposition carried him to the west, and he was engaged as local editor in Toledo, and later in Cleveland, Ohio, where his letters from "Artemus Ward, showman," a pretended exhibitor of wax figures and wild beasts, first attracted general attention. In 1860, he became a contributor to *Vanity Fair*, a New York comic weekly paper; and being invited to lecture, soon became very popular and attractive. As a lecturer, in 1863, he visited California, making the overland trip, visit-

ing Salt Lake City, the Mormon capital, and drawing crowds in every town he visited. In 1864, he opened his illustrated lectures on California and Utah in New York, with immense success; and in 1866, was induced to visit England, where he became a contributor to *Punch*, and gave his lecture on the Mormons in the metropolis, at the Egyptian hall, Piccadilly. But while convulsing crowded audiences with laughter, he was wasting with pulmonary disease. Early in 1867, he went to Guernsey for a milder air, but with no benefit; and was about to embark for America, when he died at Southampton, Mar. 6, 1867. He was tall, slender, with striking features, and a most amiable character, which attracted and attached to him many friends. By his will, after providing for his mother, leaving legacies to his friends, and his library to the best boy in the school of his native village, he left the bulk of his property in trust to Horace Greeley to provide an asylum for printers. His collected writings, which have had a wide circulation in America and England, are *Artemus Ward His Book*; *Artemus Ward among the Mormons*; *Artemus Ward among the Fenians*; and a posthumous collection and biography entitled *Artemus Ward in England*.

BROWNE, EDWARD HAROLD, D.D., an English bishop, b. 1811; educated at Cambridge, and holding various professorships until in 1864 he was consecrated bishop of Ely. He has published *An Exposition of the Thirty-nine Articles*; *Aids to Faith*, etc.

BROWNE, ISAAC HAWKINS, an English poet, 1705-60; educated at Cambridge; then engaging in the law. He was twice chosen to parliament; but his reputation rests exclusively upon his poems, such as *Design and Beauty*, and *The Pipe of Tobacco*, in which he imitates Cibber, Pope, Young, Swift, and others, all of whom were living when it was published. *De Animæ Immortalitate*, a close imitation of Lucretius, was his most important work.

BROWNE, JOHN ROSS, b. 1817; an emigrant from Ireland to the United States when a child. He learned shorthand writing, and became a reporter in the United States senate. Having a desire to travel, he went first on a whale-ship, and on his return published a book of observations in Zanzibar. He next went on government business to California in 1849. Two years later he went as correspondent of a newspaper to Europe, traveling through Italy, Sicily, and Palestine, and giving an account in *Yusef*. After further service in the north-western territories and on the Pacific coast, he went to Algeria, Iceland, Poland, and Russia, and published *The Land of Thor*, and *An American Family in Germany*. In 1869, he published an elaborate report on the *Resources of the Pacific Slope*. He was minister to China for a short time, appointed in 1868, but recalled two years later.

BROWNE, SIR THOMAS, antiquary and physician, was b. in London, 1605. His father, a merchant, left him an ample fortune, and he was educated at Winchester and Oxford. He began the study of medicine, then traveled over France and Italy, and after taking the degree of M.D. at Leyden, returned and settled (1636) at Norwich, where he continued to practice as a physician. He was knighted in 1671 by Charles II., and died 1682. His chief works are: *Religio Medici* (1642); *Inquiries into Vulgar and Common Errors* (1646), and a *Discourse on Sepulchral Urns* (1648). He wrote also *The Garden of Cyrus*, or the *Quincunzial Lozenge*; besides a variety of tracts, published after his death. His writings are highly prized by many for their genial fancy, pleasing quaintness of style, and varied erudition.

BROWNE, WILLIAM, an English poet, b. 1590, of whose life little is known, save that he was in Exeter college, Oxford, and was a tutor to an earl of Caernarvon. He was of the school of Spenser, and author of *Britannia's Pastorals*, and *The Shepherd's Pipe*.

BROWNE, WILLIAM GEORGE, 1768-1813; an English traveler, educated at Oxford. He visited Egypt and Sinai in 1793, and tried to go through Abyssinia. In 1800, and later, he traveled in Greece, Asia Minor, and Sicily. In 1812, he proposed to visit Samareand, and survey unexplored Central Asia. After leaving Teheran in 1813 he was no more heard from, save that the party were attacked by banditti and plundered and Browne was murdered. Thevenot, the French traveler, found and buried what he supposed were his bones.

BROWNELL, HENRY HOWARD, 1820-72; b. Rhode Island; educated at Trinity college, Hartford, and intended for the bar, but devoted himself to teaching and authorship. In 1847, he issued a volume of poems, after which came *The People's Handbook of Ancient and Modern History*; *The Discoverers, Pioneers, and Settlers of North and South America*, etc. Near the close of the civil war he was acting ensign on admiral Farragut's staff, and after the war accompanied the admiral to Europe. In 1866 he issued in a volume *War Lyrics and other Poems*.

BROWNELL, THOMAS CHURCH, D.D., LL.D., 1779-1865; b. Mass.; graduated at Union college in 1804, where he was tutor and professor of chemistry and mineralogy. In 1810, he traveled in England and Ireland; and in 1816 was ordained a minister of the Protestant Episcopal church. In 1818 he was assistant minister of Trinity church in New York city, and in 1819 made bishop of Connecticut. It was under his care that Washington (now Trinity) college was founded, he being the first president. He was the author of *The Family Prayer Book*, and author and compiler of *Religion of the Heart and Life*.

BROWNIAN MOVEMENTS. The motion of non-living particles as seen through the microscope, often mistaken for motions of living matter. The cause of the movements has not been satisfactorily shown, but it has been surmised that heat is the motive power.

BROWNIE, a domestic spirit of the fairy order in the old popular superstitions of Scotland. The common tradition respecting the B. is, that he was a good-humored drudging goblin, who attached himself to farmhouses and other dwellings in the country, and occupied himself during night, when the family were in bed, in performing any humble kind of work that required to be attended to, such as churning, thrashing corn, etc.—a spirit not seen or spoken to, and only known by the obliging performance of his voluntarily undertaken labors—a most valuable adjunct to the domestic establishment, and unfortunately no longer obtainable by good housewives. In Cornwall, a goblin known as *Brownny* is evoked to assist at the swarming of bees (Borlace's *Antiquities of Cornwall*). The resemblance of the Scotch B. to the *Robin Goodfellow* (q.v.) of the English, and the *Kobold* of the Germans, is also so conspicuous that we must necessarily refer the different fragmentary legends on the subject to one of the old superstitions generally prevalent in Europe.

BROWNING, ELIZABETH BARRETT, England's greatest poetess, was b. in London about the year 1809. Her maiden name was *Barrett*. The culture which she received in her youth was of a kind far transcending the ordinary education even of "ladies intellectual." Classics, philosophy, and science were studied with enthusiasm and success. At a comparatively early period, she became a contributor to periodicals, and a series of articles on the Greek Christian poets indicated that she possessed both recondite learning and keen poetic insight. Her first important essay in authorship was a translation of the *Prometheus* of Æschylus in 1833. In 1838, appeared the *Seraphim, and Other Poems*, the external peculiarity of which was its endeavor to embody the ideas and sentiments of a Christian mystery in the artistic form of a Greek tragedy. Delicate health, arising from a rupture of a blood-vessel in the lungs, and the death by drowning of a favorite brother in the following year, compelled her to live in seclusion for a long time. At length her health was restored, and in 1846 she married Robert Browning (q.v.), himself a great poet. After their marriage, they resided chiefly in Italy, in whose welfare they were passionately interested. In 1850, Mrs. B. published her collected works, together with several new poems, among which was *Lady Geraldine's Courtship*. In 1851, appeared the *Casa Guidi Windows*, a poem whose theme was the struggle made by the Tuscans for freedom in 1849. *Aurora Leigh*, her longest production, was published in 1856. *Poems before Congress* appeared in 1860. Her poetry is distinguished by its depth of feeling, by its true pathos, by its noble and generous sentiments. Apparently she poured forth her verse with dangerous facility; and there are few of her poems which would not be improved by the simple process of curtailment. But there is not a thought or a sentiment of the many she has so beautifully expressed which any one would wish expunged. No writer ever exerted a better, gentler, happier influence. She died in 1861.

BROWNING, ROBERT, a distinguished contemporary poet, b. in the neighborhood of London in the year 1812, and educated at the London university. The drama of *Paracelsus*, which first brought him into notice, was published in 1836. In the following year appeared his tragedy of *Strafford*, which was brought out upon the stage, but proved unsuccessful, though Macready himself personated the hero. *Sordello* and *The Blot in the Scutcheon* also failed, through lack of vivid and impressive incident. *Pippa Passes* secured a greater measure of popular approbation. In 1855, B. published *Men and Women*, one of his greatest works, containing poems which for depth and subtlety of conception, profound analysis of the human mind in its most delicate and impassioned conditions, and abstract speculative insight, are unsurpassed in the English language. If, as some think, in vigor and brilliancy of thought he is above Tennyson, he is as far beneath him in melody of versification and artistic beauty of style. Often he shows a morbid love of obscurity, but he frequently exhibits a Shakespearian clearness of idea and emphasis of expression. Some of his *Dramatic Lyrics* are faultless. Among his other poems are *The Ring and the Book*; *Balaustion's Adventure* (1871); *Prince Hohenstiel-Schwangau* (1871); *Red Cotton Night-cap Country* (1873); *Aristophanes' Apology* (1875); *The Inn Album* (1875); *Pucchiarotto, with other Poems* (1876); *La Saisiaz: The Two Poets of Croisic* (1878).

BROWNISTS, a sect of English puritans of the 16th c., who took their doctrines and name from Robert Brown. In 1592, sir Walter Raleigh estimated their numbers at 20,000. Harsh measures suppressed them in England, or drove them out; but the exiles found refuge in Holland, where their church included a number of eminent men. Ere long they divided into Brownists and Separatists, and soon the Brownists gave place to the Independents, or Congregationalists. The Brownists objected not to the doctrine, but to the form of government of the English church, and to that of the Presbyterians as well. They would join no other reformed church on account of the toleration of unregenerate persons as members, with whom they held it impiety to be in Christian fellowship. They condemned the wedding service in church, holding marriage to be a civil contract; refused the baptism of the children of those not church-members, or of

those who did not take sufficient care of their children already baptized, and rejected all forms of prayer, holding even that the Lord's prayer was presented as a model for imitation, not for repetition. Their form of church government was democratic, all power residing in the brotherhood. The churches were severally independent; the minister of one could not officiate in another. Lay brothers could prophesy or exhort, and it was usual after a sermon to question and discuss the topics broached. Every Brownist church was a perfect body corporate, possessing full power over its own members and acts, and accountable to no other jurisdiction whatever. The principles of this sect were those of a rude and extreme independency—the natural reaction from the ecclesiastical abuses of those times. Their leader, late in life, returned to the established church, becoming again a clergyman in it. His followers divided among themselves on some minor points of principle or of method, and the sect as a body came to nought. Yet those who favor "voluntaryism" in the church as against national establishment, and the sovereignty of the local congregation as against the consolidation of all the churches of some vast region, claim that the Brownist movement was the rough prophecy and heralding of a cardinal principle of polity then about to be restored to the church after ages of neglect.

BROWNLOW, WILLIAM GANNAWAY, 1805–77; b. Va. He was bred to the carpenter's trade, but in 1826 became a Methodist minister, and was for 10 years an itinerant. He took part in politics, advocating the election of Adams in 1828. In 1837, he was editor of the *Knareville Whig*, and his bold and quaint utterances soon gave him a wide reputation. In 1856, he defended the Methodist church in a work called *The Iron Wheel Examined and its Spokes Extracted*. Two years later, with Rev. A. Pryne of New York, he discussed the question, "Ought American Slavery to be Perpetuated?" Brownlow defended slavery. In the secession he clung to the union as the best means of upholding the institutions of the south. For this he was arrested by the confederate government and sent out of their lines. He returned to Tennessee in 1864, and the next year was elected governor, and in 1869 was sent to the United States senate. He was ardent, fearless, and resolute, caring little for refinement in speech or action.

BROWN PIGMENTS, a term in art applied to those substances in which the three primary colors unite in unequal proportions, red being in excess. B. P. are chiefly mineral, and are used sometimes in a raw but usually in a burned state. The most important are bister, asphaltum, umber, terra di sienna, Mars brown, Cassel earth, and brown madder.

BROWNS on porcelain are generally imparted by a mixture containing more or less sulphate of iron, and which, when heated, leaves the red oxide of iron (rust) on the porcelain, forming a more or less deep-tinted ochre. See POTTERY.

BROWNS on cloth are communicated by arnotto (q.v.) and copperas, assisted by fustic, sumach, peachwood, logwood, and alum. See DYEING.

BROWN-SÉQUARD, CHARLES EDWARD, b. in the island of Mauritius, 1818; a French-American physiologist. He was educated and took the degree of M.D., in Paris, in 1840, and thenceforward devoted his attention to experimental physiology, occasionally coming to the United States to lecture and make observations. His name is connected with many interesting experiments with the blood, such as transfusion, fibrinizing and defibrinizing, and with oxygen and other elements. He concludes that arterial blood is subservient to nutrition, and maintains the irritability of the muscles; and that venous blood is necessary to produce muscular contraction. He puts natural animal heat at 103° Fahr., four or five degrees higher than the standard of most physiologists. Concerning the spinal cord, most authorities agree that its posterior columns are sensitive, and convey sensation to the brain; that the interior columns are motor, and convey the influence of the will to the voluntary muscles; and that the gray matter of the cord serves only to reflect impressions from the sensitive to the motor nerve roots. Brown-Séquard concludes that the sensitive fibers do not communicate directly with the brain, but convey impressions to the gray matter of the cord, by which they are transmitted onward to the brain, and that their decussations or crossings take place on the cord itself, at or near the point at which they enter, not at the cerebellum or medulla oblongata. He came to the United States to reside in 1864, and was appointed professor of the physiology and pathology of the nervous system in the medical department of Harvard university, where he remained four years. Returning to France in 1869, he was appointed professor of experimental and comparative pathology in the school of medicine at Paris. In 1858, he started the *Journal of the Physiology of Man and Animals*; in 1869, he published *Archives of Normal and Pathological Physiology*. He again returned to the United States in 1873, began practice in New York city, and, with Dr. Seguin, commenced the publication of the *Archives of Scientific and Practical Medicine*.

BROWNSON, ORESTES AUGUSTUS, LL.D., 1803–77; b. Vermont; a theologian and author. He was at first a Presbyterian, but soon became a Universalist preacher, and was an indefatigable writer in support of whatever he for the time adopted. In 1828, he went into politics and tried to establish a workingmen's party in New York, moved thereto by the ideas of Robert Owen. In 1832, he was enthusiastic over Dr. Channing, and became a Unitarian preacher; in 1836, he organized in Boston "The Society of

Christian Progress," as a church of which he was pastor. About this time he published *New Views of Christianity, Society, and the Church*, which was a moderate attack on Protestantism. In 1838, he started the *Boston Quarterly Review*, which had existence for about five years, and was then merged in the *New York Democratic Review*. In 1840, he published *Charles Elwood, or the Infidel Converted*, a treatise in the form of a story, in favor of the Roman Catholic church, towards which the author was drifting, and which he joined in 1844. His literary labor was enormous, nearly all the original matter in his various reviews and magazines being from his own pen. Though so changeable in his early years, he seems to have found a final conviction in his late life; and he certainly gave to the Roman Catholic church a sincere and powerful advocacy.

BROWN SPAR, a name often given by mineralogists to certain varieties of dolomite (q. v.), or magnesia limestone, of not unfrequent occurrence, distinguished by a brownish or reddish color, and a pearly luster, upon account of which they are also sometimes called *pearl spar*.

BROWNSVILLE, a t. in Fayette co., Penn., 30 m. s. of Pittsburgh; pop. '70, 1749. The village is on the Monongahela river, over which there is a large and expensive bridge. The river is navigable to this point.

BROWNSVILLE, a village in Haywood co., Tenn., on the Louisville and Memphis railroad, 57 m. n.e. of Memphis; pop. '70, 2454—1016 colored. There is a college for women under Baptist direction. The village is in a rich planting district, and has a good trade.

BROWNSVILLE, a city in Cameron co., Texas, on the Rio Grande opposite Matamoras (Mexico), 35 m. from the gulf; pop. '70, 4905. It is a port of entry, and has a considerable commerce. Fort Brown, near the city, is occupied by a United States garrison.

BROWN UNIVERSITY, at Providence, R. I., was organized in 1764, at Warren, in the same state, and removed in 1770 to its present location. It was known at first as Rhode Island college, but in 1804 the name was changed in honor of Nicholas Brown, one of its most munificent benefactors. It has been from the beginning under Baptist direction and patronage, but it is not sectarian in its teaching. It has an endowment of \$775,000, and an annual income of \$65,000. Its property is valued at over \$1,250,000. The college buildings, five in number, stand upon elevated ground, and are inclosed in a campus of 16 acres, beautifully graded and adorned with trees, chiefly elms. The library, a choice and admirable selection, contains 52,000 volumes and 16,000 pamphlets; and a permanent fund of \$27,000 insures its constant increase. The museum of natural history contains a valuable collection of specimens. There are (1880) 14 professors, 3 other teachers, and 260 students. The alumni number 2845. Mr. James Manning was the first president, Rev. Jonathan Maxey the second, and Rev. Asa Messer the third. The latter was succeeded in 1827 by Rev. Francis Wayland, D.D., one of the most eminent of American divines and educators, under whose direction the institution greatly prospered. His successors have been Barnas Sears, D.D., LL.D., 1865-67; Alexis Caswell, D.D., LL.D., 1867-72; and the present incumbent, E. G. Robinson, D.D., LL.D., appointed in 1872. A fund of \$50,000, created by the state, sustains 30 scholarships. More than 50 other scholarships, each yielding about \$60 per annum, have been established; and there is an arrangement whereby \$25 is annually deducted from the tuition of a number of indigent students, not exceeding two fifths of the whole body.

BRSHESINY, an insignificant t. of Poland, in the government of Piotrkov, 62 m. s.w. of Warsaw, near the railway that connects Warsaw with Vienna and other places. Pop. '67, 6040.

BRUCE, a co. in n.w. Ontario, Canada, on lake Huron; 1600 sq. m.; pop. '71, 68,815. There is a coast line of 130 m. in the n.w. part of the county, forming a long peninsula between the lake and Georgian bay. Vast beds of salt underlie the coast along the lake. In the s. part the soil is level and fertile. Capital, Walkerton, on Saugeen river.

BRUCE, the surname of a family illustrious in Scottish history, descended from Robert de Bruis, a Norman knight, who accompanied William the conqueror to England in 1066, and died soon after. His younger son, Adam, who acquired large possessions in Yorkshire, left a son, Robert de Brus of Cleveland, a companion in arms of prince David of Scotland, afterwards David I., from whom he received a grant of the lordship of Annandale, held by the tenure of military service. At the commencement of the war in England between Stephen and Matilda, niece of the king of Scots, Robert de B. adhered to the former, and renounced his allegiance to David, resigning his lands in Annandale to his son Robert. In 1138, he was sent by the barons of the north of England to negotiate with David, who had advanced in support of his niece's claims as far as Northallerton, Yorkshire. In the battle of the Standard which followed, he took prisoner his son Robert, then 14 years of age, who, as lord of Annandale, fought on the Scottish side. He died in 1141. His English estates were inherited by his eldest son, Adam, whose male line terminated in Peter de B. of Skelton, constable of Scarborough castle in 1271. Robert de B., 2d lord of Annandale, had two sons: Robert—who married a natural

daughter of William the lion, and died, without issue, before 1191—and William, whose son, Robert, 4th lord of Annandale, married Isobel, 2d daughter of David, earl of Huntingdon and Chester, brother of William the lion, and thus laid the foundation of the royal house of Bruce. He died in 1245.

BRUCE, DAVID, son of king Robert Bruce, succeeded his father, in 1329, as David II., when only 5 years old. In terms of the treaty of Northampton, he had married, when 4 years old, Joanna, daughter of Edward II. of England, and on 14th Nov., 1331, he was crowned with her at Scone. In 1333, the success of Edward Baliol and the English party obliged David's guardians to send him and his consort to France; but on the dispersion of Baliol's adherents, David returned to Scotland in 1341. He made three unsuccessful inroads into England, and on a fourth invasion, in 1346, was taken prisoner at the battle of Neville's Cross, near Durham, and conveyed to the tower of London. Thence he was removed to Odilham, in Hampshire, and not released till 1357, when his ransom was fixed at 100,000 marks. His queen dying in 1362, he married Margaret Logie, a Scottish gentlewoman of singular beauty, whom he divorced in 1370. He had no issue; and in his latter years, he was engaged in several intrigues with England, with the view of excluding his nephew, Robert, the steward of Scotland, the next heir, from the throne. He died at Edinburgh castle, Feb. 22, 1371.

BRUCE, EDWARD, king of Ireland, brother to the above, a chivalrous but rash and impetuous prince, was actively engaged in the struggle for Scotland's independence; and in 1308, after defeating the English twice, made himself master of Galloway. In 1315, the chieftains of Ulster tendered to him the crown of Ireland, on condition of his assisting them to expel the English from the island. With a small army of 6000 men, he embarked at Ayr, and reached Carrickfergus, May 25th of that year, accompanied by sir Thomas Randolph, earl of Moray, sir John of Soulis, sir John the Stewart, sir Fergus of Ardrossan, and other Scottish knights of renown. His rapid victories soon made him master of the province of Ulster, and he was crowned king of Ireland, May 2, 1316, but was slain at the battle of Dundalk, Oct. 5, 1317.

BRUCE, GEORGE, 1781–1866; b. Scotland, came to Philadelphia in 1795 as a printer, and in 1803 became publisher of the *New York Advertiser*. In 1812, he and his brother introduced the art of stereotyping, and followed that and type-founding thereafter. One of the nephews was the inventor of a machine for casting types.

BRUCE, JAMES, a celebrated traveler, born at Kinnaird house, Stirlingshire, Dec. 14, 1730, was the eldest son of David Bruce, esq., of Kinnaird, and Marion Graham of Airth. Educated at Harrow, he was sent, in the winter of 1747, to the university of Edinburgh, with the intention of studying law; but changing his views, he went to London, and having, in Feb., 1754, married the daughter of a wine-merchant's widow, became a partner in the business. His wife dying within a year, he made a tour on the continent, and on his father's death in 1758, he succeeded to the estate of Kinnaird. In 1761, he retired from the wine-trade, and in 1763 was appointed consul-general at Algiers. He remained there about two years, studying the oriental languages, and acquiring the rudiments of surgery. He then went to Aleppo, where he took further instructions in the medical art, being resolved to travel in the character of a physician. In June, 1768, he proceeded to Alexandria and from Cairo set out on his famous journey to Abyssinia, which forms an epoch in the annals of discovery. Sailing up the Nile to Syene, he crossed the desert to Cosseir, and arrived at Jeddah in April, 1769. After various detentions he reached Gondar, the capital of Abyssinia, in Feb., 1770; and on Nov. 14 of that year, succeeded in reaching the sources of the Abawi, then considered the main stream of the Nile. This accomplishment of the chief object of his journey filled him with the greatest exultation. He remained about two years in Abyssinia, and returning by way of Sennaar and the desert of Assouan, after great hardship reached Alexandria, whence he embarked, Mar., 1773, for Marseilles. In France he spent a considerable time, visiting the celebrated count de Buffon, and other distinguished men, and in 1774, he returned to Scotland. In 1776, he married Mary, daughter of Thomas Dundas, esq., of Fingask, by whom he had two sons and one daughter. His long-expected *Travels to Discover the Sources of the Nile, in the Years 1768–73*, were published in 1790, in 5 large 4to vols. with plates and charts. The work contained such curious accounts of the manners and habits of the people of Abyssinia, that it startled the belief of many, and some of them were set down as fabrications. Among other doubters were De Tott in France, and Dr. Johnson in England. Modern travelers, including Salt, Pearce, Burckhardt, Belzoni, and others, have, however, fully confirmed his statements. B. died April 27, 1794, at Kinnaird, of a fall down stairs.

BRUCE, MICHAEL, a minor Scottish poet, the son of a weaver, b. at Kinnesswood, Kinross-shire, Scotland, Mar. 27, 1746, was, in his younger years, employed as a herdboyl. In 1762, he was sent to Edinburgh University to study for the ministry, and when not at college, was engaged as a village schoolmaster. He had all his life to struggle with poverty, and his frame being weak, melancholy took possession of his mind, and his constitution began visibly to decline. He died of consumption, July 6, 1767, aged 21. His poems, few in number, and of a tender and pathetic description, were published by the rev. John Logan, his fellow-student and associate at college, at Edinburgh in 1770. His last composition was a touching elegy on his own approaching death.

BRUCE, ROBERT, the most heroic of the Scottish kings, was b. Mar. 21, 1274. In his youth he favored the English interests, in the expectation, doubtless, of his father being preferred to the Scottish throne. In 1296, as earl of Carrick, he swore fealty to Edward I. at Berwick, and the following year he renewed his oath of homage at Carlisle. Shortly after, he abandoned the cause of Edward, and, with his Carrick vassals, joined the Scottish leaders in arms for the independence of their country. On the defeat of the Scots, a few months afterwards, at Irvine, B. made his peace with the English monarch. After Wallace's defeat at Falkirk, B. burned the castle of Ayr to the ground, to prevent its falling into the hands of the English, and retired into the recesses of Carrick. In 1299, the year after Wallace had resigned the regency, B., then in his 25th year, was admitted one of the four regents, who ruled the kingdom in the name of Baliol. In the three campaigns which subsequently took place, previous to the final subjugation of Scotland, B. continued faithful to Edward, and in 1305 was consulted in the settlement of the government. With John Comyn, called the Red Comyn, the nephew of Baliol, he appears to have entered into some agreement as to their rival claims to the throne. In an interview between them, in the church of the Minorite Friars, Dumfries, Feb. 4, 1305-06, a quarrel took place, and B., in a paroxysm of passion, stabbed Comyn with his dagger. Rushing out to his attendants, he exclaimed: "I doubt I have slain the Red Comyn." "You doubt!" cried one of them; "I mak sikker!" (i.e., sure), and, running into the church with some others, slew Comyn and his brother, who attempted to defend him. B. hastened to Lochmaben castle, assembled his vassals, and asserted his right to the throne. Two months after (Mar. 27), he was crowned king at Scone. An English army, under the earl of Pembroke, nominated by Edward governor of Scotland, took possession of Perth, and on the night of the 18th June, attacked B. in the wood of Methven, compelling him to retreat into the wilds of Athole. At Dalry, near the head of Loch Tay, B. was attacked by Alexander, lord of Lorn, chief of the Macdougals, husband of the aunt of the Red Comyn, and compelled to retire. Sending his queen and her ladies to Kildrummie castle, Aberdeenshire, under the charge of Nigel Bruce and the earl of Athole, he, with 200 followers, crossed Loch Lomond, and had recourse for subsistence to the chase. B. next took refuge in the little island of Rathlin, on the n. coast of Ireland, where he remained all winter, and was supposed to be dead. In his absence, the English took the castle of Kildrummie, hanged Nigel Bruce and other chiefs who had defended it, and tore the queen and princess Marjory from the sanctuary of St. Duthac, Ross-shire. All B.'s estates were confiscated, and himself and adherents excommunicated by the pope's legate at Carlisle. In the spring of 1307, with about 300 men, B. landed in Carrick, and at midnight surprised the English garrison in his own castle of Turnberry; but before a superior force he retired into the mountainous districts of Ayrshire. At Loudon hill, May 10, 1307, he defeated the English under the earl of Pembroke, and, three days after, overthrew another party under the earl of Gloucester. In less than two years he wrested from the English nearly the whole of Scotland. His authority being now established, in 1309 B. advanced to Durham, laying waste the country. The same year, Edward II. of England invaded Scotland, but was compelled to retreat from Edinburgh to Berwick-upon-Tweed. In the harvest of 1312, the Scots again invaded England, but unsuccessfully. B. now reduced the Isle of Man also. On his return, in the autumn of 1313, he found his brother, Edward Bruce, engaged in the siege of Stirling castle, held by sir Philip Mowbray for the English. A treaty was entered into, by which Mowbray bound himself to surrender it, if not relieved before 24th June following. This led to the memorable battle of Bannockburn, 24th June, 1314, at which B. commanded in person. The English, under Edward II., amounting, it is said, to about 100,000 men, were totally routed, leaving 30,000 dead upon the field; while the Scots, numbering only 30,000, and 15,000 camp-followers, lost about 5000. In 1317, B. passed over to Ireland, to assist his brother, Edward, elected king of that country, and defeated the Anglo-Irish under the baron of Clare; and in the spring of 1318 the Scots army invaded England by Northumberland. Another invasion of Scotland by the English king, who was compelled to retreat, was followed by B. again marching into England. After besieging Norham castle, he defeated Edward once more at Biland abbey, Yorkshire. A truce was, in consequence, ratified between the two kingdoms at Berwick, June 7, 1323, to last for 13 years. On the accession of Edward III., in 1327, hostilities recommenced; and the Scots being again victorious, a final treaty was ratified in a parliament at Northampton, Mar. 4, 1328, recognizing the independence of Scotland, and B.'s right to the throne. His warfare was now accomplished, and, suffering under the disease of leprosy, he spent the last two years of his life at Cardross castle, on the northern shore of the firth of Clyde. He died June 7, 1329, in his 55th year, and the 23d of his reign. His heart, extracted and embalmed, was delivered to sir James Douglas, to be carried to Palestine and buried in Jerusalem. Douglas was killed fighting against the Moors in Spain, and the sacred relic of B., with the body of its devoted champion, was brought to Scotland, and buried in the monastery of Melrose. B.'s body was interred in the abbey church of Dunfermline; and, in clearing the foundations for a third church on the same spot in 1818, his bones were discovered. He was twice married: (1) to Isabella, daughter of Donald, tenth Earl of Mar—issue, a daughter, Marjory, wife of Walter the high steward, whose son ascended the throne as Robert II.; and (2) to Elizabeth, daugh-

ter of Aymer de Burgh, earl of Ulster—issue, one son, who succeeded him as David II., and two daughters.

BRUCE, ROBERT DE, fifth lord of Annandale, son of the fourth lord above mentioned, and the competitor with John Baliol for the crown of Scotland, was b. in 1210. On the death of his mother, the princess Isobel, in 1252, he did homage to Henry III. for her lands in England, and in 1255 was made sheriff of Cumberland, and constable of the castle of Carlisle. About the same time he was appointed one of the fifteen regents of Scotland, in the minority of Alexander III. In 1264, he led, with Comyn and Baliol, the Scottish auxiliaries to the assistance of the English monarch at the battle of Lewes, where he was taken prisoner, but released after the battle of Evesham, the following year. On the Scottish throne becoming vacant at the death, in 1290, of Margaret, the "maiden of Norway," granddaughter of Alexander III., Baliol and Bruce claimed the succession, the former as great-grandson of David, earl of Huntingdon, by his eldest daughter, Margaret; the latter as grandson, by his second daughter, Isobel. Edward I. of England, to whom the dispute was referred, decided in favor of Baliol, 19th Nov., 1292. To avoid swearing fealty to his successful rival, B. resigned Annandale to his eldest son, Robert de B., earl of Carrick. He died at his castle of Lochmaben, Dumfriesshire, in 1295, leaving three sons and a daughter.

BRUCE, ROBERT DE, earl of Carrick, eldest son of the preceding, accompanied king Edward I. of England to Palestine, in 1269, and was ever after greatly esteemed by that monarch. On his return to Scotland, he married in 1271, Martha Margaret, countess of Carrick, and in her right became earl of Carrick. Following the example of his father, to avoid doing homage to Baliol, he resigned the lordship of Annandale to his eldest son, Robert, the future king of Scotland, then a minor. Retiring to England, he was, on the death of his father, in 1295, appointed constable of the castle of Carlisle; and in the following year, when Baliol renounced the authority of Edward, and, assisted by the Comyns, had recourse to arms, B. fought on the side of the English. After the battle of Dunbar, in which the Scots were defeated and Baliol compelled to relinquish the sovereignty, he made application to Edward for the vacant crown, but was refused it. He died in 1304.

BRUCEA, a genus of shrubs somewhat doubtfully referred to one or other of the allied natural orders *rutaceæ* (q.v.), *simarubaceæ* (q.v.), and *xanthoxylaceæ* (q.v.).—*B. anti-dysenterica*, or *ferruginea*, is an Abyssinian species, the leaves of which are said to be tonic, astringent, and useful in dysentery. Those of *B. Sumatrana*, a native of the Indian archipelago, China, etc., possess the same medicinal properties. They are intensely bitter.—The Abyssinian species acquired a factitious importance in the beginning of the 19th c., from a mistaken belief that it produced the dangerous false Angostura bark (see **ANGOSTURA BARK**), and in this belief the name *brucine* (q.v.) was given to an alkaloid really produced by the *nux vomica* (q.v.) and other species of *strychnos* (q.v.).

BRUCHSAL, a t. of the grand duchy of Baden, situated on the Salzbach, and on the railway between Heidelberg and Carlsruhe, 12 m. n.e. of the latter place. B., which is a place of considerable antiquity, has three suburbs. The old castle of the prince-bishops of Speier, who took up their residence here early in the 11th c., is still standing, and in the church of St. Peter are some ancient tombs. B. has two prisons organized on a modified form of the Pennsylvania system. Pop. '75, 10,810, who were chiefly engaged in the wine trade.

BRUCINE is one of the alkaloids (q.v.) present in *strychnos nux vomica* along with strychnine, etc. It is not so abundant as the strychnine, nor is it so poisonous. It is mainly characterized by giving a blood-red color with concentrated commercial nitric acid, and, indeed, the red color always yielded by *nux vomica*, and occasionally by strychnine when treated with nitric acid, is due to the presence of brucine.

BRUCITE, a native magnesian hydrate, found in serpentine in New Jersey, and in the chrome mines in Texas. Syn. MgH_2O_2 .

BRÜCKENAU, a village of Bavaria, on the Sinn, 36 m. n.e. of Würzburg. It is famous in connection with the baths of B., which are picturesquely situated in a beautiful part of the valley of the Sinn, about 2 m. w. from the village. The grounds are tastefully laid out in gardens, and charming walks traverse the surrounding woods. The place is a favorite summer-resort of the Bavarian court. B. has paper-mills. Pop. '71, 1669.

BRUCKER, JOHANN JAKOB, a German theologian and historian, 1696-1770. He was educated at Jena, where he took the degree of A.M. in 1718, and the next year published *Tentamen Introductionis in Historiam de Ideis*. In 1723 came *De Vita et Scriptis Cl. Etringeri*, and in 1731 he was chosen a member of the Berlin academy of sciences. Thence he went to Augsburg as pastor of the church of St. Ulric, where he published dissertations on the history of philosophy, and still later a history of philosophy in dialogue form. In 1741 came the first volume of his great work on the critical history of philosophy, completed in 1744, a work that had an immense success. He wrote many other works on philosophical subjects, and superintended and corrected an edition of Luther's translation of the New Testament, but did not live to complete it.

BRÜGES (Ger. *Brügge*), a city of Belgium, capital of the province of West Flanders, is situated in a fertile plain about 8 m. from the sea, with which it is connected by the three canals from Ghent, L'Ecluse, and Ostend, the latter admitting the largest sea-going ships. Lat. $51^{\circ} 12' \text{ n.}$, long. $3^{\circ} 14' \text{ e.}$ B. derives its name from its many bridges, all opening in the middle to admit of the passage of vessels. The ramparts surrounding the city are an agreeable promenade. The streets have a venerable and picturesque appearance, but they are greatly deserted, the population of the city being now scarcely a quarter of what it was during the middle ages. Among the most interesting buildings are the town-hall, with a lofty tower and a celebrated set of 48 bells; a Gothic senate-house, built about the close of the 14th c.; a court of justice, containing a famous carved chimney-piece of the date 1559; the church of Notre Dame, with its spire 450 ft. high, its many valuable paintings, and a statue of the Virgin (said to be by Michael Angelo), for which Horace Walpole offered 30,000 florins, and its splendid monuments of Charles the Bold and his daughter Mary, wife of the emperor Maximilian; the cathedral of St. Sauveur, not remarkable for its exterior, but containing paintings by eminent masters; St. John's hospital, with celebrated pictures by Memling, etc. The academy of painting contains several fine pictures by J. van Eyck. B. has manufactures of woolen, linen, cotton, lace, leather, cordage, and tobacco; and distilleries, sugar and salt refineries, and ship-building yards. Railways connect B. with Ostend, Ghent, and other cities of Belgium and the continent. Pop. '76, 45,097, of whom nearly a third are paupers. B. is a very ancient city. Here, it is said, St. Chrysolus preached the gospel as early as the 3d century. In the 7th c., B. was the capital of the surrounding district called Flanders, and before the conquest of England by the Normans, its commercial importance was established. In the beginning of the 13th c., it was the central mart of the Hanseatic league; and in the following century it may be said to have become the metropolis of the world's commerce. Commercial agents from 17 different kingdoms resided here, and no less than 20 ministers from foreign courts had mansions within its walls. Its population at this time amounted to upwards of 200,000. In 1488, the citizens rose in insurrection against the archduke Maximilian, and with the harsh measures of repression which ensued, commenced the commercial decline of Bruges. Many of the traders and manufacturers, driven forth from their own country, settled in England, and from this time may be dated the beginning of English manufacturing superiority. In the 16th c., however, the tapestry of B. was still celebrated throughout Europe, and the famous Gobelin tapestry of Paris is said to owe its origin to a manufacturer of Bruges. The city was taken by the French in 1794, and soon after incorporated with the French empire; but in 1815 it became a part of the kingdom of the United Netherlands, and in 1830 of the Belgian monarchy.

BRUGG, or **BRUCK**, a village of Switzerland, in the canton of Aargau, on the right bank of the Aar, and near the mouth of the Reuss, about 9 m. n.e. of Aarau. It is interesting as occupying a part of the site of the ancient *Vindonissa*, the strongest fortress, as well as the most important settlement of the Romans in Helvetia; and also as the cradle of the house of Hapsburg, to whom, in early times, it belonged. The remains of the castle of Hapsburg, founded by count Radbod of Altenburg in 1020, are still to be seen on a wooded height, about 2 m. from the village. Nearer, is the abbey of Königsfelden, founded in 1310 by the wife and daughter of the emperor Albert, who, two years before, was murdered on the spot by his nephew and others, for which a terrible revenge was taken on the relatives of the murderers. In the vaults beneath the abbey are interred many of the members of the Austrian royal family. High conical-roofed towers guard the exit and entrance to B., which has a pop. of (1870) 1338. Zimmerman was a native of this place.

BRÜGMANS, **SEBALDUS JUSTINUS**, 1763-1819; a Dutch naturalist and physician, professor of philosophy and physical sciences at Franeker, Holland, where he founded a museum of comparative anatomy. He organized and became chief director of the sanitary institutions of Holland. He improved the condition of military hospitals, and by his effort the 20,000 soldiers wounded at Waterloo were properly cared for. In 1815, he was at the head of the sanitary service of the army and navy. Many of his papers on medical science and natural history have been published.

BRUGSCH, **HEINRICH KARL**, PH. D., b. 1827; a German Egyptologist, and director of the Egyptian museum in Berlin. He made two visits to Egypt for archæological purposes, and was a member of the Prussian embassy to Persia in 1860. In 1864, he founded at Leipsic a periodical devoted to Egyptian archæology. At Gottingen he was professor in 1868-70, when he became director of an Egyptological school at Cairo. He has published several important works on Egyptian subjects, one especially interesting, on the Biblical story of the crossing of the Red sea, advancing a theory quite different from that long accepted as to the place of that event. He assigns the crossing by the Israelites and the engulfing of the Egyptians to the vast morass near the shore of the Mediterranean, and occasionally inundated by its waves driven by a strong wind. His evidences of this show ingenuity and learning, but have not commanded the general assent of scholars.

BRÜHL, a t. of Rhenish Prussia, about 9 m. s.s.w. of Cologne, on the railway to Bonn. It is surrounded by old walls, and has a splendid chateau, erected in the early

part of the 18th c. by the elector Clement Augustus of Bavaria. There is also an ancient Franciscan convent, now converted into a seminary for Roman Catholic school-masters. After his banishment from France in 1651, cardinal Mazarin took up his residence in Brühl. Pop. '75, 3499.

BRÜHL, HEINRICH, Count von BRUHL, prime-minister of Augustus III., king of Poland, and elector of Saxony, deserves a place in history as a signal example of an unworthy minister and venal statesman. He was born in 1700, at Weissenfels, and in early life entered, as a page, into the service of the duchess of Sachsen-Weissenfels. His winning address and tact gained for him rapid promotion through several offices of state, until, in 1747, he became prime-minister to that idle and unpatriotic ruler, Augustus III. Never was a ruler more slavishly obeyed by a statesman. B. would follow the prince, as he strolled about smoking, without speaking a word for a whole day; or, when his majesty lazily inquired: "Brühl, have you any money for me?" "Yes, sire," would be the constant reply; but in order to be able to give this answer as frequently as it was demanded, B. drained the coffers of the state, and burdened the country with debt. He, however, contrived to enrich himself, and to accumulate honors and titles. By Elizabeth of Russia, he was invested with the order of St. Andrew, and by Charles VI. of Austria, he was made a count of the empire. He kept 200 servants, paid his body-guard better than Augustus did his, furnished the costliest table, possessed the finest wardrobe, and, in short, maintained the most splendid establishment in the kingdom. "Of all statesmen," said Frederick II., "Brühl has collected the greatest quantity of fine clothes, watches, lace, boots, shoes, and slippers!" The effect of B.'s reckless robbery of the national finances to gratify the dissolute Augustus and himself, made itself felt at the outbreak of the seven years' war, when the country could only furnish 17,000 men to oppose Frederick of Prussia, who surprised and captured the whole Saxon army in its camp at Pirna. Augustus and B. fled to Warsaw. When peace was concluded, they returned to Dresden, where Augustus died on the 5th Oct., 1763, and was followed by his worthless parasite, 28th October. B.'s palace is still one of the principal buildings in Dresden, and his library of 62,000 vols. forms a chief part of the royal library, Dresden.

BRUISE, or **CONTUSION**, signifies an injury inflicted by a blow or sudden pressure, in which the skin is not wounded, and no bone is broken or dislocated. Both terms, and especially the latter, are employed in surgery to include all such injuries in their widest range, from a black eye to a thoroughly crushed mass of muscle. In the slighter forms of this injury, as in ordinary simple bruises, there is no tearing, but only a concussion of the textures, the utmost damage done being the rupture of a few small blood-vessels, which occasions the discoloration that is always observed in these cases. In more severe contusions, the subjacent structures—muscles, connective tissue, vessels, etc.—are more or less ruptured, and in extreme cases, are thoroughly crushed, and usually become gangrenous. The quantity of blood that is extravasated mainly depends upon the size and number of the ruptured blood-vessels, but partly also on the nature of the textures of the injured part. Thus, a lax tissue, as that of the eyelids, favors the escape of blood into the surrounding parts. Moreover, the constitution of the patient has some influence, and many persons, especially (according to Mr. Paget, in his article on "Contusions" in Holmes's *System of Surgery*, vol. i.) pallid, fatty, soft-skinned women, though suffering from no apparent disease, are subject to extravasations, and consequently to discolorations, very disproportionate to the injuries that cause them.

The most characteristic signs of a recent contusion are more or less shock (q.v.), pain, swelling, and discoloration of the surface from effused blood (commonly known as *ecchymosis*, q.v.). There is nothing special in the character of the shock, but it is worthy of notice that it is most severely felt in injuries of special parts—as the testes, the breasts, and the larger joints, which are often followed by remarkable general depression, faintness, loss of muscular power, and nausea. The immediate pain following the blow is succeeded by a feeling of numbness, which, after a varying time, unless the part is killed, gives place to a heavy, aching pain. Although some depression may usually be observed immediately after the infliction of the blow, swelling of the parts rapidly follows, as may be well seen in the case of a child receiving a blow on the head, or of the wale that rises after the lash of a whip. In lax parts, such as the eyelids, the swelling is often considerable, and may remain for a week or more; but in other parts, it usually subsides in two or three days. The discoloration of the skin consequent on blows is of a more or less purple tint, varying from black to crimson or pink. "Blackness," says Mr. Paget (*op. cit.*), "usually indicating intense injury, is probably due to the extravasation of a large portion of entire blood; crimson or pink tints, to the prevalence of a blood-stained fluid; blue, to the degrees in which blackness is veiled by the cuticle and skin, as the color of blood in veins is; and perhaps some of the shades of pink to the partial aëration of the blood by the penetration of air through the epidermis. After a variable time, proportionate to the severity of the injury, these colors fade out, passing most commonly through gradually lightening shades of brownish olive, green, and yellow." The causes of these changes of color are not clearly known; as, however, the changes are not observed in bruises of parts removed from air and light, they are probably due to oxidation and actinic agency. When a severe B. tends to a natural

cure, and there is no inflammation or sloughing, the effused blood is generally absorbed, the liquid portion rapidly disappearing, while the blood-cells are more slowly removed. In some cases, it is probable that the effused blood becomes organized into vascular connective tissue, which takes part in the repair of the injured tissue. We need not follow the course of a B. in which active inflammation with suppuration ensues, or in which sloughing takes place, as these complications must be treated according to the ordinary rules of those affections. There are, however, one or two ill consequences following partial recovery, which require notice. Thus, in some organs, as the breast, abscess may ensue long after a blow; or a sensitive indurated lump may remain; or (more commonly) there may be long-continued pain, without change of texture; or, lastly, cancer may ensue. Blows on superficial bones, as those of the skull, are not unfrequently followed by very painful thickening of the periosteum; and a muscle violently struck may be paralyzed, and rapidly waste away; and constitutional diseases, such as gout and rheumatism, are well known to localize themselves with special severity in parts that have once been seriously bruised.

With regard to treatment, simple and not very severe bruises require little treatment but the rest necessary for the avoidance of pain; but the removal of the swelling and discoloration may be hastened by the application of various local stimulants, which seem to act by accelerating the circulation through the bruised part, and promoting the absorption of the effused fluid. Friar's balsam, compound soap liniment, or poultices made with the roots of black bryony beaten to a pulp, are popular remedies of this class. Mr. Paget regards the tincture of arnica as the best application. Where the skin is thick, it may be gently rubbed over the bruised part in an undiluted state; where the skin is thinner, it should be mixed with an equal bulk of water; or, which is probably better, it may be constantly applied as a lotion if diluted with five or six parts of water. Pugilists, who are probably better acquainted with ordinary bruises than any other class of men, are in the habit of removing the swelling of the eyelids that often naturally occurs during a prize-fight, to such an extent as to close the eyes, by at once puncturing the eyelids at several points with a lancet; and their favorite remedy for a black-eye or other B. on the face is a fresh beef-steak applied locally, as a poultice. Bruises of a more severe nature, as when there is much breaking or crushing of the tissues, must, of course, at once be placed in the hands of a surgeon.—For further details on this subject, the reader is referred to Mr. Paget's excellent article, from which we have freely quoted.

BRUMAIRE (Lat. *bruma*, winter), a division of the year in the republican calendar of France. It includes the time from Oct. 22 to Nov. 20. The celebrated 18th B., which witnessed the overthrow of the directory and the establishment of the sway of Napoleon, corresponds with Nov. 9, 1799, of the Gregorian calendar.

BRUMATH, or **BRUMPT**, a t. of Lower Alsace, on the Zorn; pop. '71, 5619. It has a castle and mineral wells, and is on the site of the ancient Brucomagus.

BRUMIDI, **CONSTANTINE**, 1805–80; a native of Rome, Italy, son of a Greek father and an Italian mother, widely known as a fresco painter. He was educated in the college of fine arts at Rome, and came to the United States in 1852. His first work, "The Crucifixion," was in St. Stephen's church in New York. Thence he went to Philadelphia and to the city of Mexico, at both places employing himself in church decoration. In 1854 he arrived in Washington, and was at once employed on the bare walls and ceilings of the national capital, the rotunda of which contains many fine pieces from his hand, combining mythology, allegory, and history. There are cartoons of his yet to be put in place, but by other hands, including "Oglethorpe and the Indians," "The Battle of Lexington," "Surrender of Cornwallis," "Decatur at Tripoli," "The Death of Tecumseh," "Entrance of General Scott into Mexico," and "The Discovery of Gold."

BRUMMEL, **GEORGE BRYAN**, 1778–1840 (better known as "Beau" Brummel); a man of wealth and fashion, who became an intimate companion of the prince of Wales, and was looked upon by the society of his day as the "glass of fashion and the mold of form." He was the arbiter in all matters of fashion, and considered the very top of perfection in taste, especially in dress. As long as his fortune lasted or the prince of Wales would contribute, he kept up an elegant bachelor establishment in London; but finally he lost the favor of his royal friend, became poor, gambled recklessly, fled from his creditors, and died in France in a hospital for mendicants.

BRUNCK, **RICHARD FRANÇOIS PHILIPPE**, one of the most ingenious critics and philologists of modern times, was born at Strasburg, Dec. 30, 1729. He was educated under the Jesuits in Paris; but abandoned his studies, and for some time was engaged as a military commissary during the seven years' war. A professor in Giessen, with whom B. happened to lodge while the army was in winter quarters, revived in him the love of classical studies. Returning to Strasburg, he devoted all his spare time to Greek, and soon distinguished himself as an able but adventurous critic and emendator. His belief that all inaccuracies in ancient Greek writings were introduced by copyists, often led B. astray; but, since the revival of learning, few critics have done more for the progress of Greek literature. His first work, *Analecta Veterum Poëtarum Græcorum* (1772–76), was followed by several editions of *Anacreon* (1778–86), and

editions of Apollonius Rhodius (1780) and Aristophanes (1781-83), *Poëtæ Gnomici* (1784), Virgil (1785), and Sophocles (1786-89). The last of these established a new era in the criticism of the tragic writers. The outbreak of the French revolution interrupted B.'s studies. He ardently attached himself to the popular side. During the reign of terror, he was imprisoned, but was liberated after the downfall of Robespierre. His means, however, had been so much reduced that he was compelled to sell his valuable library. From this time, 1801, he turned his attention from Greek to Latin literature, and published editions of Plautus and Terence. He died June 12, 1803.

BRUNDISIUM. See BRINDISI, *ante*.

BRUNE, GUILLAUME MARIE ANNE, a French marshal of the first empire, was b. at Brives-la-Gaillarde, 13th Mar., 1763. His education brought him at an early period into connection with the men of the revolution. Along with Danton, he helped to establish the Cordeliers' club. After the conquest of Belgium, he was sent as civil commissary to that country, but his warlike aspirations soon induced him to enter the military service. In 1797, he became brigadier under Napoleon in the army of Italy, and distinguished himself at Arcola and Rivoli, where he was made gen. of division and leader of the advance-guard. Sent by the directory to Switzerland in 1798, he executed his orders with brilliant success. In 1799, he was appointed to the command of the army of Holland, where he achieved the reputation of being one of the best generals of his age. He vanquished the Anglo-Russians at Bergen on the 19th of Sept., 1799, and on the 19th of Oct., forced the duke of York, commander-in-chief of the combined armies, to capitulate at Alkmaar, under humiliating circumstances. In 1803, he was named ambassador to the Ottoman porte, and was received by Selim III. with great distinction. In 1804, he obtained the dignity of marshal, and in 1805 returned to France. Two years afterwards, B. became governor-general of the Hanseatic towns, and was charged with the conquest of Pomerania; but circumstances having occurred which unnecessarily excited the distrust of Napoleon, he was recalled, and his future services dispensed with. After the fall of the emperor, he declared for the Bourbons, but his offers were rejected, and in consequence he joined Napoleon after his return from Elba. He was now made a peer, but the battle of Waterloo completely destroyed his prospects. He again made his submission, but was barbarously assassinated at Avignon, 2d Aug., 1815, by the populace, who were infuriated against him on account of certain crimes laid to his charge, of which, however, he seems to have been entirely guiltless.

BRUNEHAUT, or **BRUNEHILDE**, 534-613; daughter of Athanagild, king of the Visigoths and wife of Sigebert, king of Austrasia. Her sister Galsunda, the wife of Chilperic, king of Neustria and the brother of Sigebert, had been abandoned and murdered by Chilperic at the demand of his mistress, Fredegonda, who became queen. Brunehaut induced her husband (Sigebert) to invade Neustria, where, while besieging Tournay, he was slain by emissaries of Fredegonda, and Brunehaut was taken prisoner by Chilperic. At Rouen she persuaded one of Chilperic's sons to marry her, and, with the help of the bishop of the place, she escaped to Austrasia, which was then ruled by Childebert; but she recovered her authority. After the death of Childebert she provoked war between her grandsons, heirs to the throne, in which one was killed, and she was about to take the throne when a son of Fredegonda, Clothaire II., interposed and captured her easily, as her army refused to fight. She was for three days exposed to torture and insult, and then tied to the tail of a wild horse and dragged to death, after which the body was burned and the ashes scattered to the air.

BRUNE ISLAND lies off the s. part of the e. coast of Tasmania, from which it is separated by D'Entrecasteaux bay. It has a length of 32 m., with a breadth varying from 1 to 6 m.; and its e. or outside coast is indented by a bay, which takes its name from the *Adventure*, one of Cook's two vessels during his second voyage.

BRUNEL, ISAMBARD KINGDOM, an eminent engineer, son of the following article, b. at Portsmouth, England, in 1806, was educated at the college of Henri Quatre, Caen, in France. He commenced practical engineering in 1826, under his father at the Thames tunnel, and in the progress of that great work was often exposed to danger from the water breaking in and flooding the excavations, having more than once to save his life by swimming. He assisted in his father's experiments for making carbonic acid gas a motive power, and was designer and civil engineer of the *Great Western*, the first steamship built to cross the Atlantic; and of the *Great Britain*, the first ocean screw-steamer. The *Great Eastern*, the largest vessel ever built in the world, was erected under his sole direction. In 1833, B. was appointed chief-engineer to the Great Western railway, and designed and constructed the whole of the tunnels, bridges, viaducts, and arches on this line, and extension branches. Among other docks at English seaports, in the improvement and construction of which he was engaged, may be mentioned the Bute docks at Cardiff, and the old North dock at Sunderland. In 1842, he was employed by government to construct the Hungerford suspension-bridge across the Thames at Charing Cross, London. In 1850-53, he constructed the works of the Tuscan portion of the Sardinian railway. Made a fellow of the royal society in 1830, he was chosen on the council in 1844. He was also vice-president of the institution of civil engineers, and of the society of arts; a fellow of the astronomical, geological, and geographical societies, and chevalier of the legion of honor. He died suddenly, Sept., 1859.

BRUNEL, SIR MARK ISAMBARD, the celebrated engineer of the Thames tunnel, son of an agriculturist, was born at Hacqueville, near Rouen, in France, April 25, 1769. He early showed an inclination for mechanics, and at school preferred the study of the exact sciences to the classics. In 1786, he became a sailor in the French navy. In the revolutionary period of 1793, having compromised himself by his political opinions, he escaped from Paris to the United States. His career as an engineer began in 1794, when he was appointed to survey for the canal which now connects lake Champlain with the river Hudson at Albany. He afterwards acted as an architect in New York. On his return to Europe in 1799, he married the daughter of William Kingdon, esq., Plymouth, and settled in England. A plan submitted by him to government for making block-pulleys for ships by machinery was adopted, and he was for many years employed in carrying it into execution in Portsmouth dockyard. He was also successful in the construction of other public works—in Woolwich arsenal and Chatham dockyard, etc. His most remarkable undertaking was the Thames tunnel, formed beneath the bed of the river, and which, commenced in Mar., 1825, was opened to the public in Mar., 1843. Assisted by his son, the subject of the previous article, he for ten years pursued a course of experiments for employing carbonic acid gas as a motive-power, but the cost of the machinery prevented its introduction as a substitute for steam. Among the less important of B.'s inventions, were machines for making wooden boxes; for ruling paper; for shuffling a pack of cards without using the hands; for the manufacture of nails; and for making seamless shoes for the army—the latter, tried for two years, was abandoned from economical motives. Elected a fellow of the royal society in 1814, he was appointed vice-president in 1832. He was knighted in 1841; and died, Dec., 1849, in his 81st year.

BRUNELLESCHI, FILIPPO, one of the greatest Italian architects, was b. at Florence, in 1377. He first learned the art of a goldsmith; next, that of a sculptor; and finally, devoted himself to architecture. He also studied zealously both mechanical and mathematical science, and is reckoned the first who established, on a sound basis, the theory of perspective. When still a young man, B. went to Rome, where he acquired a profound knowledge of ancient architecture, the result of which was that two ideas completely possessed his mind: the one was to revive the ancient style of architecture; the other was, to make himself master of the mechanical knowledge of the ancient architects. In 1407, he returned to Florence. In 1420, it was proposed to complete the structure of the cathedral of Santa Maria del Fiore, founded in 1296, and now only wanting a dome. A great assembly of architects from all quarters was convened to determine how it might be practicable to cover the vast octangular area. While the debate was going on, B. was earnestly elaborating his own design; but when he first came forward and proposed his plan, it was so ill received, on account of its supposed absurdity, that B. was "lifted off his legs, and carried out of the room." He, however, obstinately persisted in explaining his scheme, and at last succeeded in convincing every one of its feasibility. The work was intrusted to him, and finished, with the exception of the lantern, with which he intended to crown the whole, but was prevented by his death in 1444. B.'s dome, measured diametrically, is the largest in the world, and served as a model to Michael Angelo for that of St. Peter's. Besides this *chef-d'œuvre*, B. executed several other great works, such as the churches of San Spirito and San Lorenzo, as well as the designs for the Pitti palace, which originated the beautiful style of Tuscan palace-architecture in the 15th century.

BRUNI, LEONARDO, a native of Arezzo, and hence styled *Aretno*, was b. in 1369. He merits notice as one of the most learned men who flourished during the epoch of the revival of Greek learning in Italy. He first studied law at Florence and Ravenna, but afterwards turned his attention to classical literature. He then went to Rome, where he filled several offices at the papal court. In 1414, he attended John XXII. to the council of Constance. On the deposition of that pope, he returned to Florence, where he was of service to the republic in several important matters. His *Historia Florentina* procured for him the rights of citizenship, and, at a later period, through the favor of the Medicean family, he was appointed state-secretary. He died 9th Mar., 1444. Florence and Arezzo vied with each other in the splendor with which they celebrated his obsequies.

B. aided in advancing the study of Greek literature mainly by his literal translations into Latin of Aristotle, Demosthenes, Plutarch, and others. Of his original works, which are very numerous, many have never been printed, and most are nearly forgotten. We may mention *Commentarius Rerum suo Tempore Gestarum* (Ven. 1476); *De Origine Urbis Mantuæ*; *De Romæ Origine*; *Epistolæ Familiæres*; and *Vite di Dante e del Petrarca*.

BRÜNN, a fortified city of the Austrian empire, capital of the government of Moravia, is beautifully situated, partly on the slope of a hill, and partly in a pleasant valley, at the confluence of the Schwarzwawa and the Zwittawa, in lat. 49° 12' n., and long. 16° 37' east. Behind the city, on an eminence, is situated the castle of Spielberg, formerly the citadel, but now used as a state-prison, and noteworthy as the place in which Silvio Pellico was confined from 1822–30. Among the most interesting buildings of B. are the cathedral of St. Peter; St. James's church, a Gothic edifice, with a tower 276 ft. in height, and a valuable collection of ancient printed books; the church of the Minorites; and the Augustine convent. There are also several fine palatial residences belonging to the old

nobility. B. is one of the most important manufacturing towns in the Austrian dominions. Its woollens are specially celebrated, and it has also manufactures of cotton, silk, ribbons, yarns, glass, leather, soap, tobacco, and dye-stuffs. Pop. Dec. 31, '69, 73,771. Napoleon made B. his headquarters before the battle of Austerlitz.

BRUNNEN, a village of Switzerland, in the canton of Schwyz, of which it forms the port, near the mouth of the Muotta, in the lake of Lucerne. It is beautifully situated at the south-eastern bend of the lake, and is celebrated in history as the place where, in Dec., 1315, the deputies of the forest cantons, who, eight years before, had formed a plan for the liberation of their country from the Austrian yoke, laid the basis of the Helvetic republic.

BRUNNER, SEBASTIAN, b. 1814; chaplain of the university of Vienna, where he studied theology. In 1848, he established the *Vienna Church Gazette*. Soon after he published, under the name *Nibelungen-Lied*, a satire upon Hegel's doctrines. His entire works have been collected in 20 vols. Among them is a sharp criticism of Renan's *Life of Christ*. In all his writings he is of the ultramontane Roman Catholic school.

BRUNNER, or BRUNN, JOHANN CONRAD, 1653-1727; a German anatomist, professor in the university of Heidelberg, and physician to the elector palatine. He made many anatomical investigations, particularly in the pancreas, the small intestines, and the duodenum. His name lives in the *Brunner's Glands*.

BRUNNOW, Count, ERNEST PHIL. VON, a Russian diplomatist, was b. at Dresden. 1797, and studied at the university of Leipsic. At the time of the congress of Aix-la-Chapelle, he entered the Russian service, and the ministers Nesselrode and Capo d'Istria recognized at once his fitness for a diplomatic career. Among other posts, he attended the congresses of Troppau and Laybach, acted one year as secretary to the embassy in London, went to the congress of Verona, and then occupied for a time a high office in St. Petersburg. He was present, in a civil capacity, in the campaigns of 1828 and 1829 against the Turks. In the autumn of 1839, he was sent on a special mission to London, to take advantage of the unpleasant feeling between Great Britain and France for drawing the cabinets of St. Petersburg and London closer together, and in the following spring was accredited as permanent ambassador. In this capacity he soon acquired distinction as a diplomatist. After retiring from London on the outbreak of the war in 1854, he represented Russia in Frankfurt, and, along with count Orloff, was sent to the conference of Paris, Feb., 1856. Immediately after the treaty of peace had been concluded, he was sent on a special mission to London, to re-establish friendly relations between the courts of St. Petersburg and St. James's. He was afterwards appointed to the court of Prussia; but in 1858 he returned to his old place in London, where he was a great favorite. He represented Russia at the conferences in London in 1864 and 1871. In recognition of his services, he was raised by the emperor of Russia to the rank of count in April, 1871. In 1874, he retired to Darmstadt, where he died in the following year.

BRUNO, SAINT, the founder of the Carthusian order of monks, was b. at Cologne 1051, and received his earliest education in the school attached to the collegiate church of St. Cunibert. Subsequently, he studied at Rheims, where he distinguished himself so greatly, that bishop Gervasius appointed him director of all the schools in his diocese. B., however, soon began to be troubled by the wickedness of his time, and, anxious to escape from what seemed to him the general pollution, he took refuge, along with six pious friends, in a desert place near Chartreuse, in the diocese of Grenoble. Here, in 1086, he founded one of the most austere of all the monkish orders, which received its name from the locality whence it had sprung. See **CARTHUSIANS**. B. and his companions had each a separate cell, in which they practiced the severities of the rule of St. Benedict, keeping silence during six days of the week, and only seeing one another on Sundays. Pope Urban II., who was one of B.'s most eminent scholars, in 1089 summoned the saint to Rome. B. obeyed the call reluctantly, and steadily refused all offers of preferment. In 1094, he established a second Carthusian monastery, called La Torre, in a solitary district of Calabria, where he died in 1101. He was not canonized until 1628. B. left no written regulations for his followers. These first made their appearance in a complete form in 1581, and were enjoined on all Carthusians by Innocent IX.

BRUNO, THE GREAT, Archbishop of Cologne, and Duke of Lorraine, one of the most eminent men of his time, was b. about 928 A.D. He was the third son of Henry the Fowler, and the brother of Otto I., emperor of Germany. Baldrich, bishop of Utrecht, and afterwards Israel Scotigena, and others, were his tutors. His surprising knowledge, sagacity, and eloquence secured for him an immense influence over the bishops and clergy, while, on the other hand, his liberality, meekness, and great earnestness of heart won the affections and reverence of the laity. Summoned by Otto to the imperial palace, he quickly assumed an influential position among the chroniclers, poets, and philosophers of the court. At a later period he was appointed archbishop of Cologne, and lord high chancellor of the empire. He accompanied Otto to Italy in 951, and honorably distinguished himself by his fidelity to his brother, when Otto's own son, Conrad, and others of his kindred rebelled against him. As a reward, the emperor appointed

him duke of Lorraine. B. died at Rheims, 11th Oct., 965. He wrote a commentary on the Pentateuch, and several lives of saints.

BRUNO, GIORDANO, the precursor of the school of modern pantheistic philosophers, was born at Nola, in the kingdom of Naples, about the middle of the 16th century. He entered, at an early age, the order of the Dominicans, but soon began to express his doubts in regard to the doctrines of transubstantiation and of the immaculate conception, in consequence of which he was obliged to flee from his convent. Henceforth, his life was unsettled. In 1580, he went to Geneva, where he spent two years, but having excited the suspicion and dislike of the strict Calvinists of that city by his general skepticism, he judged it prudent to betake himself to Paris, where he delivered prelections on the "great art" (logic) of Raymond Lully. His disputes with the bigoted Aristotelians of the university of Paris compelled him, however, to leave France. He passed over into England, where he resided for two years in comparative quiet, enjoying the friendship of sir Philip Sidney and the protection of the French ambassador, Michel de Châteauneuf de la Mauvissière. Here he composed his most important works, but at last, having incurred the displeasure of the clergy by his vehement denunciation of the Aristotelian philosophy, and other grave heresies, he returned to Paris in 1585. In 1586, he proceeded to the university of Marburg, where he matriculated; and to Wittenberg, where he became professor; but being asked to join the Lutheran communion, he refused. On his departure from the city, he pronounced an impassioned panegyric on Luther. After spending some time in Prague, Brunswick, Helmstadt, and Frankfort-on-the-Main, he resolved to go back to Italy. He fixed his residence at Padua; but after a stay of two years, he went to Venice, where he was arrested by the officers of the inquisition, and conveyed to Rome in 1598. He was now subjected for two years to persecution, in the vain hope that he would recant; but when all the endeavors of his enemies proved ineffectual, he was brought to the stake on the 17th Feb., 1600, and burned as an obstinate heretic.

B.'s writings, of which the most valuable are composed in Italian, display throughout a strong, courageous, excitable soul, susceptible of deep enthusiasm, but vainly laboring to attain perspicacity. The *Cena delle Ceneri*, or evening conversations on Ash-Wednesday, is an apology for the Copernican astronomy; the *Spaccio della Bestia Trionfante*, or expulsion of the triumphant beast (Par. 1584), is a satirical but somewhat heavy allegory in the style of the times. His greatest works are metaphysical, such as the *Della Causa Principio ed Uno* (On the One Sole Cause of Things) and the *Del Infinito Universo e Mondi* (On the Infinity of the Universe and of Worlds). The doctrine enunciated in these is pantheistic. B. held that the infinite soul of God did not merely inhabit or pervade the universe, but that the universe was simply a manifestation of him, and therefore itself divine. God was therefore, in the most literal and physical sense, all in all. B.'s philosophy, in later times, was quite unappreciated, and even neglected, until Jacobi drew public attention to it in his *Letters on the Doctrine of Spinoza*. Both Spinoza and Descartes were much indebted to Bruno. His influence is also discernible in the pantheistic speculation of modern Germany. Original editions of B.'s works are very rare. Those in Italian were published by Wagner in 1830: some Latin ones by Gfrörer in 1836. See Bartholomè's *Bruno* (1846); Berti's *Vita di B.* (1868).

BRUNSWICK, a co. in s.e. North Carolina, on the ocean and cape Fear and Waccamaw rivers; 1100 sq. m.; pop. '70, 7754—3306 colored. It is level and swampy, with poor soil, but producing rice and cotton. Tar, rosin, and fine lumber are exported. The railroads are the Washington, Columbia and Augusta, and the Wilmington and Weldon. Co. seat, Smithville.

BRUNSWICK, a co. in s.e. Virginia, on North Carolina, watered by the Roanoke and Nottaway rivers; 600 sq. m.; pop. '70, 13,427—8902 colored. Productions, tobacco, corn, wheat, etc. Co. seat, Lawrenceville.

BRUNSWICK, a t. in Glynn co., Ga.; a port of entry on St. Simon's sound, 8 m. from the ocean, and 80 m. s.s.w. of Savannah, at the s.e. terminus of the Macon and Brunswick and Albany railroads. There is a lighthouse at the entrance of the sound, and the harbor is spacious and safe. Pine lumber is the chief article of export. Pop. 2348.

BRUNSWICK, a t. and village in Cumberland co., Me., on the Androscoggin, 8 m. w. of Bath. It is at the head of navigation and the foot of water-power on the river, and has mills and other manufacturing establishments. Here are Bowdoin college and the Maine medical school. The Maine Central and other railroads unite at B. Shipbuilding and lumbering are leading industries. Pop. about 2500.

BRUNSWICK, DUCHY OF (Ger. *Braunschweig*), a state of northern Germany, consisting of three larger and five smaller distinct parts, and lying mostly within lat. 51° 38' to 52° 28' n., and long. 9° 23' to 11° 30' east. Its entire area amounts to about 1425 sq. miles. Pop. in 1875, 327,493. For administrative purposes, B. is divided into six circles—viz., Brunswick, Wolfenbüttel, Helmstedt, Gandersheim, Holzminden, and Blankenburg. Of the three larger parts, the principal one, forming the circle of Wolfenbüttel, and including the capital, lies between Prussia and Hanover; the second, extending e. and w. from Prussia to the Weser, divides Hanover into two parts; and the third, forming the circle

of Blankenburg, lies to the s.e. between Hanover, Anhalt, and Prussia. The smaller parts are the isolated bailiwicks of Calvörde in the e., Thedinghausen in the w. (not far from Bremen), and some very small demesnes in the Hanoverian boundaries. B. belongs mostly to the basin of the Weser, which serves as a boundary on the west. The surface is mostly mountainous, particularly in the southern portions of the country, but B. has nevertheless level tracts of considerable extent. The rivers, with the exception of the Weser, are comparatively unimportant, though advantage is taken of one or two for the transport of timber. The climate in the low lands resembles the general climate of northern Germany; but in the Harz district it is so much colder, that harvest is generally a month later than in the plains.

The mines and quarries of B. produce marble, alabaster, limestone, gypsum, alum, iron, copper, lead, sulphur, and salt in large quantities, with some portions of gold and silver. Agriculture, which is carried on with intelligence and energy, constitutes the chief wealth of the duchy. The products include, beside the ordinary cereals, large quantities of leguminous plants, potatoes, tobacco, and hops. The pasture-land is extensive, and great attention is paid to the rearing of cattle, and especially to the breeding of sheep, wool being an important article of commerce. A large number of persons are employed in the cutting and preparation of timber. The chief manufactures of B. are of linen, stockings, woolen cloth, metals, porcelain, paper, sugar, glass, beer, etc.

The inhabitants are mostly Saxons, and, with the exceptions of about 3000 Reformed, 7000 Roman Catholics, and 1100 Jews, all adhere to the Lutheran church. The people in the rural districts speak a very broad low-German dialect; but good high-German is spoken by the educated classes. Education is well looked after by the government, which is a limited monarchy, the duke being head of the state, and his power restricted by the legislature, which is partly hereditary and partly elective. As a state of the German empire, B. has two votes in the Bundesrath (confederate council), and sends three deputies to the Reichstag or parliament.

Taxes are voted triennially in Brunswick. The revenue for the three years ending 1878 was 7,700,133½ marks (£385,006) a year. The public debt in 1876 amounted to 91,874,442 marks (£4,593,722), of which a large portion was borrowed for the construction of railways. The civil list of the duke is not comprised in the budget, being paid out of a special fund consisting of the revenues of the state domains, which amount to 729,166 marks, and other receipts amounting to about 70,000 marks.

B. was included, as a part of Saxony, under the empire of Charlemagne. In 1235, B., with Lüneburg, was made a duchy under Otto, who died in 1252, and was succeeded, in 1267, by his son Albrecht, founder of the older line of Wolfenbüttel. John, another son of Otto, was the founder of the older Lüneburg line, which became extinct with William of Lüneburg in 1369. In 1569, Henry, who styled himself duke of Brunswick-Lüneburg-Dannenberg, founded the new house of Brunswick-Wolfenbüttel; and his brother William founded the new line of Brunswick-Lüneburg, which, in 1815, became the kingdom of Hanover. See HANOVER.

BRUNSWICK, the capital of the duchy of Brunswick, is situated on the Oker, in a level and fertile district, in lat. 52° 46' n., and long. 10° 4' east. B., which is a very old place, is supposed to have been first walled about the 9th c., by Bruno, duke of Ostfalen. But Henry the lion, in the 12th c., so greatly beautified and extended the city that he may be almost said to be its founder. In the 13th c., B. became a member of the Hanse league, and soon attained considerable commercial prosperity, but its importance declined with the decay of the league. The town is most irregularly built, with narrow and crooked streets, but possesses the advantages of good causeways and an abundant supply of water. The cathedral—in which are preserved some interesting relics brought by Henry the lion from the Holy Land—with the churches of St. Martin, St. Catharine, and St. Andrew, with its steeple 316 ft. high, are among the principal buildings. In the museum are some interesting antiquities and works of art by Jan Steens, Albert Dürer, Holbein, Rembrandt, Raphael, Guido, Ruysdael, Michael Angelo, and Benvenuto Cellini. The industry of B. consists chiefly in manufactures of woolen and linen, chicory, beet-sugar, tobacco, *papier-mâché*, lackered wares, etc. Its great annual fair, founded in 1498, is important. The old fortifications of B. have been demolished, and their site converted into pleasant promenades. A fine avenue of linden-trees leads to the duke's palace, an imposing edifice, built in 1869. Pop. '75, 65,938.

BRUNSWICK, HOUSE OF. Henry the Lion, who held the united duchies of Bavaria and Saxony in the 12th c., may properly be called the immediate ancestor of this house, though they can trace their lineage back to Albert Azo I., margrave of Este in Italy, who died in 964. The eldest son of Henry the Lion became count palatine by marriage; his second son, Otho, died in 1218 after having been crowned German emperor, and it was therefore William, a younger son, who succeeded to the Brunswick inheritance. Otho, a grandson of Henry the Lion, was invested in 1235 with these domains as a fief of the empire and recognized as the first duke of Brunswick. Ernest the Pious, or the Confessor, who died in 1546, inherited the principalities of Brunswick-Lüneburg, and was the founder of both branches of the existing dynasty; he took an active part in the reformation and signed the confession of Augsburg. His descendant, Ernest Augustus, duke of Brunswick-Lüneburg, was raised to the dignity of ninth elector of the empire in

1692, by his marriage with Sophia, a grand-daughter of James I. of England. His son George Lewis succeeded to the crown of Great Britain in 1714. Ferdinand, a later duke of this house, entered the Prussian service in 1740, distinguished himself in the seven years' war, decided the battle of Prague, and gained the victories of Corfeld and Mindou. The ducal residence, which had been at Wolfenbuttel, was in 1754 removed to Brunswick by duke Charles; he founded the famous Collegium Carolinum, and was a faithful ally of England during the seven years' war. He died 1780. His successor, Charles William Ferdinand, was a nephew of Frederick the great, and married Augusta, daughter of George III. of England. He fought in the seven years' war, and played an important part at the battle of Krefeld in 1758. In 1792 he was commander-in-chief of the allied armies of Austria and Prussia against France. He marched into Champagne, but was compelled to conclude an armistice with Dumouriez after trying in vain to force the position of Valmy. In 1806 he was called to lead the Prussian troops against Napoleon, who defeated him at Jena and Auerstadt; he retired broken-hearted, and died soon afterwards from the effects of his wounds. Napoleon incorporated his duchy with the new kingdom of Westphalia, but after the battle of Leipsic it was restored to his son Frederick William, who had distinguished himself in the campaigns of 1792, 1793, 1806, and who fell at the head of his troops at the battle of Quatre-Bras in 1815. His son Charles Frederick was a minor, and up to 1823 George IV. of England acted as prince-regent. The people of B. endured the misrule of Charles Frederick for seven years; then they revolted and drove him out of his duchy in 1830. He died childless at Geneva in 1873. By an act of the Germanic diet the duchy was transferred to his brother William, prince of Oels (b. 1806), who assumed the government, April 25, 1831. He is still unmarried, and, if he dies without issue, Brunswick will pass to the house of Hanover.

BRUNSWICK BAY, on the n.w. coast of Australia, in long. 125° e., and about lat. 15° south. It receives Prince Regent river.

BRUNSWICK BLACK is a varnish employed for coating over coarsely finished iron grates, fenders, etc. It is mainly compounded of lamp-black and turpentine, and when applied with a brush, quickly dries, and leaves a shining jet-black surface.

BRUNSWICK GREEN is a pigment used in the arts, and consisting of the hydrated chloride and oxide of copper ($\text{CuCl} \cdot 3\text{CuO} \cdot 4\text{H}_2\text{O}$). It may be prepared (1) by acting upon metallic copper with common salt and diluted sulphuric acid, (2) by acting upon metallic copper with moistened sal-ammoniac, or (3) by mixing sulphate of copper and common salt into a paste with water. It is found native at Atacama, in Peru, in the form of a green sand, hence the name atacamite (q. v.).

BRUNSWICK, NEW. See NEW BRUNSWICK.

BRUSA, or BURSA. See BROUSSA, *ante*.

BRUSASORCI, or DOMENICO RICCI, 1494–1567; an Italian painter noted for his close imitation of Titian. He worked chiefly in fresco, and on mythological themes. The "Coronation of Charles V.," the "Procession," "Phathon," and the "Martyrdom of St. Barbara," are among his more important achievements.

BRUSH, GEORGE JARVIS, b. New York, 1831; educated at Yale, and at Munich, and the Freiberg mining academy; chief of the Sheffield scientific school (of Yale), and professor of mineralogy and metallurgy in Yale college. He has written upon various scientific subjects in the *American Journal of Science*, and assisted in editing Dana's *Mineralogy*.

BRUSHES AND BROOMS, implements of vegetable fiber or hair of very early use, mentioned by Homer. Brushes are simple or compound. The simple kind consists of but one tuft, and are such as hair pencils and painters' brushes. The compound have more than a single tuft. Where they are placed side by side on flat boards they are called stock brushes. Those with single tufts, such as are used by artists, are made of the hair of the camel, goat, badger, and of hog's bristles. The hairs for pencils are arranged so as to form a point in the center, and are fixed in a quill or other small tube. Compound brushes are of set or pan work, and of drawn work. The ordinary house broom is an example of pan work, into the stock of which holes are bored of the size desired. The bristles, hairs, or fibers needed to fill each hole are collected, the thick ends dipped into molten cement, usually pitch, bound with thread, dipped again, and with a quick twist set into the hole. In drawn brushes, those intended for shoes, teeth, nails, etc., and clothes, the holes are more carefully bored, and have smaller ones at the top communicating with the back of the brush, through which a loop of wire passes from the back of the stock. Half the number of hairs or fibers needed to fill the holes are passed around the wire, which is then smartly drawn up so as to double the hairs and force them as far as possible into the hole. The outside ends are made even with trimming, and the backs of the brushes are covered with veneer to conceal the wire-work. Bristles are imported from Poland, Russia, and other countries. In 1808, the manufacture of brushes from the fibers of whalebone, and in 1810, from twigs of broom, rushes, and other plants, was patented. In 1842, split quills were added, and in 1872, horn and other substances. The great staple in the United States is broom-corn, a considerable amount being raised in the state of New York, and manufactured by the Shakers. Revolving

brushes were patented in 1811; and in 1862, revolving hair brushes, for the use of barbers, were introduced, but they have never become popular. As long ago as 1699, there was invented "a new engine for sweeping the streets of London, or of any city or town." But nothing of the kind was put in use until 1825, when revolving brooms were used. A great many improvements followed, and at the present time street-sweeping by such machines is common in large cities. The most important recent invention in brush-making is of American origin, the Woodbury machine for bunching, wiring, and inserting bristles in the stock. In this machine a metal comb of uniform thickness is filled with bristles, holding them by the middle, so that one half of the bristles appear above the surface of the comb, and the other half underneath. The comb thus charged moves in guide-ways, and discharges bristles from each division successively into a channel in which they are brought into a horizontal position and a proper quantity taken up to form a tuft. This tuft is moved along an incline against the end of a cylinder, when a plunger doubles the bristles into a loop, which is seized by wire, and in an instant securely fastened.

BRUSH TURKEY, the native name of an Australian bird of the megapodiidae family, of which a dozen species are known; called also the New Holland vulture, jungle fowl, and native pheasant. It is the only wild fowl known that is gregarious in the duty of hatching. Before the time for laying eggs, several pairs of these birds unite in building an enormous pyramidal heap of vegetable matter in part decayed. In this muck-heap of leaves, grass, and rotting wood the females deposit their eggs, which are placed about a foot from each other and covered 2 ft. deep. The hatching is done by the heat of the decaying matter, and the young appear full feathered and able to take care of themselves from the first. Nests have been found that contained a bushel of eggs. Some species of the brush turkey place their eggs in sand, some construct huge mounds of earth, and some make excavations on the sea-shore. In size and general appearance it much resembles the common domestic turkey.

BRUSSELS (Fr. *Bruxelles*), the capital of Belgium, is situated on the small river Senne, a tributary of the Dyle, in lat. 50° 51' n., and long. 4° 21' east. It communicates with Antwerp and the Baltic sea, by means of the Scheldt canal, and railways connect it with Germany, France, and Holland, as well as with all the principal towns of Belgium. The city is built partly on the side of a hill, and partly on a fertile plain; and though some of the streets are so steep that they can be ascended only by means of stairs, B., on the whole, may be pronounced one of the finest cities in Europe. The upper town, situated on the side of the hill, is the newest and most fashionable, and is the residence chiefly of the great and wealthy. The king's palace, public offices, chief hotels, and mansions of foreign ministers are here. It is also much more healthy than the lower town, which, stretching along the canal and the Senne, is greatly subject to fogs. But the latter, with its numerous handsome old buildings, formerly belonging to the Brabant nobility, but now occupied by merchants and traders, has a fine picturesque appearance, while some of its public edifices are unrivaled as specimens of Gothic architecture. This part has also several noble churches, but it is now wholly given over to trade. French is spoken in the upper part of B.; but in the lower, Flemish is prevalent, and in one quarter the Walloon dialect is spoken. The English language, owing to the large number of English who reside in B. for economy, is also very common. The walls which formerly surrounded B. have been removed, and their place is now occupied by pleasant boulevards, shaded by alleys of trees, extending several miles. The *Allée Verte*—a double avenue along the Scheldt canal—forms a splendid promenade, and leads towards the palace of *Laeken*, the suburban residence of the royal family, 3 m. n. of the city. Besides the fine park in the upper town, covering an area of some 17 acres, ornamented with fountains and statues, and surrounded by the king's palace, the "palace of the prince of Orange," the chamber of representatives, and other buildings, B. has several other squares or places, among which the most noteworthy are—the *Place Royal*, with its colossal monument of Godfrey of Bouillon; the *Grand Place*, in which is situated the *Hôtel de Ville*, a splendid Gothic structure, erected in the beginning of the 15th c., with a pyramidal tower 364 ft. high, surmounted by a statue of St. Michael, the patron saint of B., and where, in 1568, the patriot counts, Egmont and Horn, were beheaded by order of the duke of Alba; and the *Place des Martyrs*, where a memorial has been erected to those who fell here in the revolution of 1830. Among the churches of B., the largest and finest is the cathedral of St. Gudule, which dates from the 12th c., and is built in the pointed Gothic style, with two towers of more-modern date, rising on each side to a height of 264 ft., many richly painted windows, a pulpit, considered the masterpiece of Verbruggen, and monuments of the dukes of Brabant and other distinguished persons. In the *Palais des Beaux Arts* is the picture-gallery, containing the finest specimens of the Flemish school of painting; the public library, with its 234,000 volumes, and its 20,000 MSS., collected by the dukes of Burgundy—MSS. interesting and valuable not only for their contents, but for the beautiful miniature paintings with which the scholars of Van Eyck adorned them. The observatory is one of the finest in Europe. The educational establishments of B. are numerous, the principal being the free university, founded in 1834, with four faculties—viz., law, medicine, mathematical and physical sciences, and belles-lettres, and having a special school of

pharmacy attached. It has also numerous charitable and benevolent institutions; and is the seat of the provincial government of s. Brabant, as well as of the general government of the kingdom. B. is one of the chief centers of the industry of the country. Its lace is particularly famous. Of the esteemed carpets which pass under the name of B. carpets, only a few are manufactured here, most of those of Belgic make being produced at Tournai. It has also manufactures of damask, linen, ribbons, paper, jewelry, hats, soap, porcelain, mathematical and musical instruments, etc. Carriage-building is also an important branch of industry. Printing and lithographic establishments are numerous; and about a dozen newspapers, of which the *Independence Belge* has a European reputation, are published daily. Pop. in 1876, 161,816; with suburbs, 348,180.

As early as the 8th c., we find B. (*Bruchsell*), then probably a villa of the Frank kings, mentioned in old chronicles, and that a church existed here in 966 is proved by a deed of the emperor Otho I. Under Charles V., B. was made the court-residence in the Netherlands, and became afterwards, under Philip II., the chief arena of the revolution, and of the atrocities committed by the duke of Alba and the inquisition. B. suffered greatly in the war of Spain against Louis XIV.—in whose reign it was bombarded by marshal Villeroi, and upwards of 4000 buildings destroyed—and in that of Austria against Louis XV.; but still more from the continual prevalence of party animosities caused by the policy of Austria. Under the mild rule of Maria Theresa, B. flourished greatly, and in this time, many of its best institutions and public buildings were founded. In 1789 occurred the Brabant revolution under Joseph II., and scarcely had Austrian rule been re-established, after a brief time of independence, when B. fell into the hands of the French, 1792. After other changes of fortune, B., with the other parts of Belgium, was incorporated with the kingdom of the Netherlands in 1815, and so remained until the revolution of 1830, by which it became the capital of the independent kingdom of Belgium.

BRUSSELS CARPETS. See CARPETS.

BRUSSELS SPROUTS, one of the many cultivated varieties of *brassica oleracea* (see BRASSICA and CABBAGE), distinguished by producing, in the axils of the leaves, little clusters of leaves which close together and form miniature cabbages. These are used, like other greens of this species, for the table, and are very delicate. The plant is cultivated much in the same way as cabbage or kale, requiring, however, less space than most of the varieties. It may be planted in shady situations, or between the rows of crops, such as pease, beans, scarlet-runners, etc., which are to be removed from the ground in autumn. The sprouts are fit for use chiefly in winter and spring. The stem sometimes attains a height of 4 ft., and the head resembles a small, imperfectly boiled savoy; but there is a subvariety with shorter stems, preferable for many situations. In some places, it is customary to remove the head early in winter, in order to promote the development of the lateral shoots in spring; but if the head is allowed to remain, the plant becomes taller, and new shoots are formed as the lower ones are removed. The seed is sown in Feb. or March. Seed is very generally imported from Belgium, as this vegetable is said to degenerate in Britain. Its use has of late rapidly extended, and none of the many varieties of the species to which it belongs is better deserving of cultivation.

BRUTTIUM, an ancient division of Italy, comprising the s. portion, now Calabria. The people known as Bruttians became rulers in the peninsula about 356 b.c. Before that period the people seem to have been of some Pelasgian races, but at an early date Greek adventurers started settlements on the coast, of which the more important were Crotona, Rhegium, and Locri. The warlike Greeks subjected the natives and held them in slavery until after the Peloponnesian war. At that period the Lucunians came in from the n. and still further oppressed the natives. At last, about the middle of the 4th c. b.c., the people rising against oppression became their own masters; they gained power rapidly, captured some of the Greek cities, and, assisted by the Lucunians, held their own against the Grecian arms. The B. were powerful until after their participation in the Samnite war against Rome, 282 b.c. Not long afterwards they were subjected to Rome and gave up much of their territory. In the second Punic war they revolted and assisted Hannibal, for which they were punished by Rome in the sacrifice of what little they had left of independence. At that time the Brutti as a nation disappeared from history.

BRUTUS, LUCIUS JUNIUS, figures in the legendary history of early Rome, as the hero who overturned the monarchical, and established the republican form of government. The legend runs that he was the son of a rich Roman. On his father's death, Tarquin the proud took possession of the property, and put an elder brother to death, and B. himself only escaped the same fate by feigning idiocy (hence the name *Brutus*, stupid). The oracle of Delphi foretold that he should govern in Rome. Remembering his own wrongs, and gifted with the strength and wisdom of one who was fulfilling the decrees of fate, B., when the foul rape committed by one of the royal family upon Lucretia had shocked the people, convoked them, placed himself at their head, and drove the kings from Rome. He is said to have been then elected one of the two first consuls (509 b.c.). That his character as a stern old Roman hero might be complete, the legend adds that he sacrificed to the new republic his own sons, detected in a conspiracy to restore the

monarchy; and that at last he fell in mortal combat repelling an attack led on by one of the sons of Tarquin. Little more, however, can be said to be established upon sufficient historical evidence with regard to B., than that there existed a person of that name who held high office in Rome at a very early period.

BRUTUS, MARCUS JUNIUS, b. 85 B.C., appears to have spent the early years of manhood in exclusive devotion to literary pursuits, and not to have taken part in the political dissensions agitating Rome till he had attained a mature age. When the civil war broke out between Pompey and Cæsar, he sided with the former; but after the battle of Pharsalia, made his submission to the latter, and, in the following year, was appointed governor of Cisalpine Gaul. On returning to Rome, he divorced his wife, in order to marry Portia, the daughter of Cato, of whose principles in politics he professed to be a disciple. The influence of Cassius prevailed upon him to join the conspiracy which ended in the murder of Cæsar. The efforts of B. to retain popular favor afterwards being unavailing to counteract the effects of the eloquence of Antony, he was forced to leave first Rome, and then Italy. The remainder of his life was spent partly in Athens, partly in Asia Minor, and partly as the leader of a marauding force which maintained itself by plundering the inhabitants of the eastern shores of the Adriatic. Defeated by Antony and Octavianus (Augustus) at Philippi (42 B.C.), he terminated his life by falling upon his sword.

BRÜX, a t. of Bohemia, situated on the Bila, about 14 m. n. of Saatz. In its vicinity are extensive coal-mines, and the famous mineral springs of Püllna and Seidlitz, from which the inhabitants of B. prepare a considerable quantity of salts. Pop. Dec. 31, '69, 6102.

BRUYAS, JACQUES, 1637-1712; one of the Jesuit missionaries in Canada, employed among the Iroquois. He mastered their speech, and wrote some pious works in it. In 1862, his *Radical Words of the Mohawk Language* was first published.

BRUYÈRE, JEAN LA. See LABRUYÈRE.

BRUYS, or BRUIS, PETER DE, a priest of southern France supposed to have been one of Abelard's pupils, founder of a sect by the name of Petrobrussians. He opposed the church as it was, seeking to restore the Christian religion to its original simplicity and freedom from symbols, denied the authority of any established hierarchy and the necessity of any priestly ministration, opposed infant baptism and the communion, and held that, as prayer could be offered anywhere, churches were useless. His followers destroyed images, burnt crosses, and maltreated priests. After many years of non-molestation B. was burnt at the stake at St. Gilles. The sect existed for a long time under the name of Henricians, from Henry of Lausanne, one of their leaders.

BRYAN, a co. of e. Georgia, on the sea-coast; 472 sq. m.; pop. '70, 5252-3605 colored. The soil is level and mostly of sand, and in a large degree covered with pine forests. The Atlantic and Gulf railroad passes through the county. Productions, rice, corn, cotton, etc. Co. seat, Eden.

BRYAN, MICHAEL, 1757-1821; an English art critic and connoisseur, author of a *Dictionary of Painters and Engravers*, a recognized standard work. In 1794, he was employed by several English noblemen to purchase the celebrated Orleans gallery of paintings, an achievement which widely enhanced his reputation.

BRYANT, JACOB, an eminent English scholar, was b. at Plymouth in 1715. He was educated at Eton and King's college, Cambridge, where he took his degree of M.A. in 1744. In 1756 he became private secretary to the duke of Marlborough, and accompanied his grace to the continent. Substantial proofs of the duke's esteem raised him above the region of pecuniary cares, and enabled him to devote his whole life to letters. He d. 14th Nov., 1804. Among his numerous publications may be mentioned: *Observations and Inquiries relating to various Parts of Ancient History* (Cambridge, 1767); *A New System or Analysis of Ancient Mythology* (1774-76); *Vindiciæ Flavianæ* (a defense of Josephus' testimony in regard to Christ), (1780); *Treatise on the Authenticity of the Scriptures and the Truth of the Christian Religion* (1792); *A Dissertation concerning the War of Troy, etc.* (1796); *The Sentiments of Philo-Judæus concerning the Logos* (1797); and a variety of dissertations on the difficult passages of Scripture (1803). B. was a man of great and-varied learning, but his intellect, although acute, was neither philosophical nor comprehensive enough to enable him to handle in a satisfactory manner the important questions on which he wrote.

BRYANT, WILLIAM CULLEN, a distinguished American poet and journalist, was b. in Hampshire, Mass., Nov. 3, 1794. At the early age of 10, he published translations from some of the Latin poets; at 13, he wrote a terse and vigorous political poem, entitled *The Embargo*; and at 18, he composed his *Thanatopsis*, a poem full of beauty. In 1815 he was admitted to the bar, and for ten years practiced with diligence and success. In 1825 he removed to a more congenial sphere, and in association with a friend, established *The New York Review*, to which he contributed many of his best poems. In 1826 he became principal editor of *The Evening Post*, the leading democratic paper of New York, which he conducted with a manliness and purity of tone that might be imitated by his professional brethren with great advantage to the character of the press.

The first collected edition of his poems appeared in 1832. They were soon after republished in Britain, and were regarded as the highest efforts, up to that time, of the American muse. In 1842, he published *The Fountain and other Poems*. B. visited Europe in 1834, and several times afterwards, and records his observations in *Letters of a Traveler in Europe and America*. In 1858, appeared a new edition of his poetical works, and in 1869, a metrical translation of the *Iliad*, followed in 1871 by that of the *Odyssey*. He afterwards engaged in writing a *History of the United States*. Although the popularity of B.'s writings has been eclipsed by those of Longfellow and Poe, they have yet a large circle of readers and admirers. B. died 12th June, 1878.

BRYAXIS, a Greek sculptor, contemporary of Praxiteles and Scopas, with whom he participated in the work on the mausoleum at Halicarnassus about 345 B.C. He also created five colossal figures of the gods at Rhodes, of Bacchus at Cnidus, of Æsculapius and Hygeia at Megara, Apollo in the grove of Daphne at Antioch, a statue of Pasiphae, and a portrait of Seleucus. It is thought that B. was the first to produce statues of Æsculapius and Serapis.

BRYDGES, Sir SAMUEL EGERTON, 1762-1837; an English author, bred to the law. He was a prolific writer, and is said to have produced 2000 sonnets in a single year. His more important works are *Censura Literaria* in 10 vols. and his own *Autobiography*, *Times*, and *Opinions*.

BRYONY, *Bryonia*, a genus of plants of the natural order *cucurbitaceæ*, distinguished by triadelphous stamens, with distinct anthers, a trifid style, and a few-seeded fruit destitute of hard rind. The stems climb by means of lateral tendrils, the leaves are angular or 3 to 5-lobed, and the flowers campanulate, 5-partite, unisexual, and generally yellow. The COMMON BRYONY (*B. dioica*), the only British species, is frequent in hedgerows in England, but is not indigenous to Scotland. It has cordate palmate leaves, axillary bunches of flowers, and red berries about the size of a pea. It abounds in a fetid and acrid juice. The root is perennial, very large, white and branched, has a repulsive smell, and is acrid, purgative, and emetic. *B. alba*, common in the middle parts of Europe, possesses similar properties. The root of both is applied topically to bruises, and was formerly very much in use as a purgative. It is now again much employed in homeopathic practice. A decoction made of 1 lb. of the fresh root is said by Withering to be "the best purge for horned cattle." It contains a bitter extractive, called *bryonine*, to which it seems to owe its properties. The young shoots of both species are, however, so free from acrid and dangerous qualities, that they may be used as pot-herbs.—The roots of other species of the genus are also acrid and purgative; but it is said that the root of *B. Abyssinica*, when cooked, is eaten without danger.—BLACK BRYONY (*tamus communis*) is a plant of a different natural order (*dioscoreaceæ*, q.v.). The genus is distinguished by an inferior ovary and succulent fruit. Black B. has long twining stems, cordate undivided leaves, greenish flowers, and red berries. Its roots are very large and fleshy, black externally. The berries are unwholesome, and the whole plant is acrid, the roots so much so as to have been formerly employed for stimulating plasters. But the young suckers, in which the acrid principle is not much developed, are eaten in Greece as asparagus, after careful boiling with change of water, as are also those of *T. cretica*. The plant is common in most parts of Europe, and is found in England, in hedges and thickets.

BRYOPHYLLUM (Gr. *bryon*, moss, and *phyllon*, a leaf), a genus of plants of the natural order *crassulaceæ* (q.v.). *B. calycinum*, a succulent shrubby plant, a native of the Moluccas, with quinate or almost pinnate leaves, oblong deeply crenulated leaflets, and panicles of large pendulous greenish-yellow flowers, is not unfrequent in British hot-houses, being regarded as an object of interest, upon account of its producing buds on the edges of the leaves more frequently than almost any other plant. These buds are capable of forming independent plants. This curious mode of propagation is found also in the bog orchis (*malaxis paludosa*), a plant of a very different natural order. See BUD and LEAF.

BRYOZOA. See ZOOPHYTES.

BRYUM (Gr. *bryon*, moss), a genus of mosses (q.v.) distinguished by a terminal fruit-stalk, a double *peristome* (see MOSSES)—the outer one of 16 teeth, the inner a membrane cut into 16 equal segments—and a dimidiate *calyptra*. The species are very numerous, and many of them are natives of Britain. They are all small, their stems short, and their leaves forming little rosettes, from the center of which the fruit-stalk springs. They very generally grow in dense patches on wet rocks, wet earth, the bark of trees, etc., beautifully clothing them with bright green.

BRZESC LITEWSKI, a walled t. of Russia, in the government of Grodno, about 108 m. s. from the city of the same name. Being advantageously situated on the right bank of the Bug, it has an extensive trade. It was the scene of a battle between the Russians and Poles in 1794. Pop. '78, 22,132.

BRZE'ZAN, a t. of Galicia, situated on the Zlota-Lipa, about 54 m. s.e. of Lemberg. It has an old castle and a gymnasium, and manufactures of linen, sail-cloth, and leather. Pop. '69, 9290.

BUACHE, or **GARDEN ISLAND**, an island of Western Australia, near the mouth of Swan river, in lat. $32^{\circ} 10'$ s., and long. $115^{\circ} 40'$ east. Though measuring only 6 m. by 1, it is yet important as sheltering from the open ocean the deep and spacious anchorage of Cockburn sound, which flows between it and the mainland of the colony.

BUANSUAH, a wild dog of India, conjectured to be the progenitor of the domestic animal. It is very shy, lives in thick woods, and, like the wolf, hunts in packs. In companies of a dozen these animals do not fear to attack the tiger. If captured young they are easily tamed.

BU'AZE, a s. African plant, of which the botanical characters and relations are not yet known, but which is likely to prove of importance on account of its fiber. Dr. Livingstone found it growing in large quantities in the Maravi country, n. of the Zambesi; but he could not procure any specimen in flower or fruit, and Dr. Hooker did not recognize the specimens of branches and leaves. It is not cultivated, and the only use to which it is put by the natives is to afford threads for stringing beads on; but Dr. Livingstone thinks its fiber stronger and finer than flax, and says that a firm thread of it feels like catgut in the hand, and would rather cut the fingers than break.

BUBALUS, **Bu'balis**, or **Bu'balé**, *Antilope bubalus*, supposed to be the *bubalus* of the ancients—although that name is now generally appropriated to the buffalo (q. v.)—a species of antelope, of that section of the genus which is characterized as *bovi*-form or ox-like. The Arabic name is *bekker-el-wash*, which signifies wild ox. It is an animal about the size of a large stag, with very ox-like head and muzzle—the head, however, remarkably long; the horns about as long as the head, surrounded by a succession of thickened rings, curved so as somewhat to resemble the sides of a lyre, the points directed backward. The general color is yellowish-brown, but the tail is terminated by a black tuft. The B. is an animal of rather coarse appearance, very destitute of the gracefulness of the typical antelopes. It inhabits Barbary, and occasional wanderers make their way to the banks of the Nile. It is figured on the monuments of ancient Egypt. It is gregarious in its habits. It is said to be easily domesticated. The most nearly related species to this, of other antelopes known, is the *kaama* (q. v.) of s. Africa.

BUBASTIS, a goddess of the Egyptians, was, in their mythology, the child of Isis and Osiris, and the sister of Horus. She was identified by the Greeks with Artemis (Diana), though upon what grounds is unknown, as the best information with regard to her is, that she was the goddess who presided over pregnancy and childbirth. The chief temple erected to B. was at Bubastis (q. v.). B. is represented on monuments as having the head of a cat, an animal which was sacred to her.

BUBASTIS (the *Pi-beseth* of Scripture, and modern *Tel Basta*), a ruined city of Egypt, about 14 m. n. of Belbeys, in lat. $30^{\circ} 36'$ n., and long. $31^{\circ} 33'$ east. B. derived its name from the Egyptian goddess Bubastis, in whose honor a temple was erected here, which, if not so large and magnificent as some Egyptian temples, was, according to Herodotus, one of the most beautiful, and vast numbers of persons were wont to make annual pilgrimages to it. Nothing but some stones of the temple, which are of the finest red granite, now remain. There are some other ruins, and mounds of great extent, consisting chiefly of the remains of brick houses and heaps of broken pottery.

BUBBLE, as a term, is defined by Blackstone as an unwarrantable undertaking by unlawful subscriptions, subjecting the parties who originate and put them in operation to the penalties of *premunire* (q. v.). The *South-sea company* (q. v.) was a terrible example of such a bubble.—The **BUBBLE ACT** is the name given to the 6 Geo. I. c. 18, "enacted," says Blackstone, "in the year after the infamous South-sea project had beggared half the nation." and which public fraud the act was intended to punish. But it was repealed by the 6 Geo. IV. c. 91, which at the same time left such companies to be dealt with by the common law.

BUBBLE SHELL. See **BULLA**

BUBO, an inflammatory tumor, seated in the groin or the armpit.

BUBO. See **OWL**.

BUCANEERS, a celebrated association of piratical adventurers, who, from the commencement of the second quarter of the 16th c., to the end of the 17th, maintained themselves in the Caribbean seas, at first by systematic reprisals on the Spaniards, latterly, by less justifiable and indiscriminate piracy. The name is derived from the Caribbee *boucan*, a term for preserved meat, smoke-dried in a peculiar manner. From this the French adventurers formed the verb *boucaner* and the noun *boucanier*, which was adopted by the English; while, singularly enough, the French used, in preference, the word *flibustier* (see **FILIBUSTERS**), a corruption of our "freebooter." The B. were also sometimes called "brethren of the coast." The arrogant assumption by the Spaniards of a divine right—sanctioned by the pope's bull—to the whole new world, was not, of course, to be tolerated by the enterprising mariners of England and France; and the enormous cruelties practiced by them upon all foreign interlopers, of which the history of that time is full, naturally led to an association for mutual defense among the adventurers of all other nations, but particularly among the English and French. The fundamental principles of their policy—for they, in course of time, formed distinct commu-

nities—were close mutual alliance, and mortal war with all that was Spanish. Their simple code of laws bound them to a common participation in the necessities of life; locks and bars were proscribed as an insult to the general honor; and every man had his comrade, who stood by him when alive, and succeeded to his property after his death. The principal center of their wild and predatory life was for some time the island of Tortuga, near St. Domingo. When they were not hunting Spaniards, or being hunted themselves, their chief occupation and means of subsistence was the chase. From the flesh of wild cattle they made their "boucan;" their skins and tallow they sold or bartered to Dutch and other traders. The history of these men embraces, as may be supposed, narratives of cruelty and bloodshed unsurpassed in the annals of crime. It has, however, not a few stories of high and romantic adventure, of chivalrous valor, and brilliant generalship. Among the "great captains" whose names figure most prominently in the records of buccaneering, were the Frenchman Montbars, surnamed by the terrible title of "the exterminator;" his countrymen, Peter of Dieppe, surnamed "the great"—as truly, perhaps, as others so distinguished—and L'Olonnas, Michael de Busco, and Bartolomeo de Portuguez, Mansvelt, and Van Horn. Pre-eminent, however, among them all was the Welshman, Henry Morgan, who organized fleets and armies, took strong fortresses and rich cities, and displayed throughout the bold genius of a born commander. He it was that led the way for the B. to the southern ocean, by his daring march in 1670 across the isthmus of Panama to the city of that name, which he took and plundered after a desperate battle. This brilliant but most unscrupulous personage was knighted by Charles II., and became deputy-governor of Jamaica. A higher subordination of the love of gold to the passion for dominion in him, might probably have made him emperor of the West Indies, some dream of which seems at one time to have occupied his mind. In 1680 and 1689, extensive buccaneering expeditions were made to the Pacific, even as far as the coasts of China, of which the best record is preserved in the lively pages of William Dampier, himself an important partner in these bold adventures. The war between France and Britain, after the accession of William III., dissolved the ancient alliance of the French and English buccaneers. After the peace of Ryswick, and the accession of the Bourbon Philip V. to the Spanish crown (1701), they finally disappeared, to make way for a race of mere cut-throats and vulgar desperadoes, not yet utterly extinct. The last great event in their history was the capture of Carthage in 1697, where the booty was enormous.—See the *Histories* of Burney and Thornberry, Dampier's *Voyages*, and the *Narratives* of Wafer, Ringrove, and Sharp.

BUCCA RI, or **BAKAR**, a free port of Austrian Croatia, on an inlet of the gulf of Quarnero, 5 m. e.s.e. from Fiume. It is beautifully situated on the slope of a hill, and has a small but very good and safe harbor. The linen manufacture is carried on here, and ship-building is actively prosecuted; but the inhabitants are principally sailors and fishermen. The tunny fishery is the chief fishery of this part of the Adriatic. The vine is extensively cultivated in the neighborhood of B., and good wine is made. Pop. '69, 2116.

BUCCINA TOR (from Lat. *buccinare*, to sound a trumpet), the name of a muscle, situated in the substance of the checks, it is so called because, when the checks are distended with air, the contraction of the B muscles forces it out.

BUCCINO, a t. of s. Italy, in the province of Salerno, pleasantly situated on the Botta, which at this point is crossed by an old Roman bridge, about 14 m. e. from Campagna. In its vicinity are quarries yielding fine marble. Pop. '72, 6049.

BUCCINUM. See **WHELK**.

BUCCLEUCH. The Scotts, dukes of B., are one of the oldest and most distinguished families in Scotland. The family traces its descent from sir Richard le Scott, in the reign of Alexander III. (1249-85); but the ancestor who first becomes historically conspicuous is sir Walter Scott of Brankholm and B., a brave and powerful chieftain on the border. B., which from this early period was destined to be associated with the family title, is a lonely estate in the vale of Rankleburn, at the head of Ettrick, Selkirkshire. The sir Walter alluded to flourished in the reign of James V., and on some incidents in his life, his great namesake founded the *Lay of the Last Minstrel*. Sir Walter fought bravely at the battle of Pinkie, 1547, and was slain in an encounter with sir Walter Kerr of Cessford in the streets of Edinburgh, 1552. He was succeeded by his grandson, sir Walter Scott of B., a knight "wise, true, and modest," who was succeeded by his only son, who bore the same name. This sir Walter is celebrated for his military exploits on the border, not the least daring of his enterprises being the rescue of one of his attendants, Kinmont Willie, from the castle of Carlisle. (See *Minstrelsy of the Scottish Border*.) For his services to the state, in which is to be reckoned his carrying away of large numbers of the border marauders to foreign wars, he was raised to the peerage, 1606, as lord Scott of Buccleuch. Dying in 1611, he was succeeded by his only son, Walter, who, in 1619, received an elevation in the peerage, as lord Whitehester and Eskdale, and earl of Buccleuch. Through his son Francis, the second earl, the family, by a grant, acquired the extensive domain of Liddesdale, formerly belonging to the house of Bothwell; also, by purchase, large territories in Eskdale; and in 1642, the barony of Dalkeith from the

Morton family. Francis left only two daughters, the eldest of whom dying without issue, the titles and estates went to her sister, Anne, who, in 1663, was married to James, duke of Monmouth, an illegitimate son of Charles II. In 1673, this pair were created duke and duchess of B., earl and countess of Dalkeith, etc. After a marriage of twenty-two years, the unhappy duke, on a charge of rebellion, was tried and beheaded, 1685; the duchess, however, retaining her honors, title, and estates, as in her own right. The duke left a family of four sons and two daughters. The duchess afterwards married Lord Cornwallis, by whom she had a son and two daughters, and died in 1732, at Dalkeith house, where she had occasionally resided in princely splendor. James, her eldest surviving son, pre-deceased his mother, and his son, Francis, by the death of his grandmother, succeeded to the title of duke of Buccleuch. Notwithstanding the connection with the son of Charles II., the family still preserved the surname of Scott. Duke Francis, in 1743, obtained a restoration of his grandfather Monmouth's earldom of Doncaster and barony of Tynedale, and was hence a British peer. In 1720, he married a daughter of James, second duke of Queensberry, and by this fortunate connection, a portion of the Queensberry estates, along with the dukedom, merged in the family of B. in 1810. Henry, third duke of B., born in 1746, was the greatest and most estimable of his family. He had for his tutor and friend Dr. Adam Smith, and his beneficent talents were directed towards the improvement of his extensive estates in the south of Scotland. The amelioration of the soil, the planting of trees, the making of roads, the improving of the breed of sheep, and the social elevation of his numerous tenantry, uniformly engaged his attention. He died in 1812, and was succeeded by his eldest son, Charles, fourth duke, who, dying in 1814, was succeeded by his son, Walter Francis, born 1806, who bears the title of duke of B. and Queensberry, marquis of Dumfriesshire, earl of Drumlanrig, B., Sanquhar, Dalkeith, etc., in the peerage of Scotland; and earl of Doncaster, etc., in the peerage of England. His eldest son, William Henry, takes the courtesy title of earl of Dalkeith. The duke, like his grandfather, is noted for the improvement of his estates, which in Scotland are situated in Mid-Lothian, Dumfriesshire, Roxburghshire, Selkirkshire, Peeblesshire, Lanarkshire, and stewartry of Kirkcudbright; his farms everywhere being noted for their good steadings and thriving tenantry. As an heritor, the number of churches and school-houses which the duke has been concerned in building is very considerable. He has one small possession in Fife—the island of Inchkeith (q.v.). The greatest public improvement ever executed in Scotland by an individual at his own private cost, was carried out by the duke of B. at vast expense. We allude to the creation of the deep-water harbor and port of Granton, on the firth of Forth, 2 m. from Edinburgh. The duke of B. was one of the chief patrons of church livings in Scotland, but waived all claim to compensation when patronage was abolished in 1874. The duke is lord-lieutenant of Mid-Lothian and Roxburghshire, and captain of the Queen's body-guard in Scotland.

BUGEN TAUR, the name of a ship which acquired much celebrity in Venice at a time when that state was a flourishing republic. A B. was known as early as the end of the 12th c.; and a vessel of the same name was burnt when the French took Venice more than six centuries afterwards; but it is not certain whether this was the same vessel, maintained by being repeatedly patched up with new ribs and planking. The B. is described as having been a galley, about 100 ft. long by 21 in extreme breadth; on a lower deck were 32 banks or rows of oars, manned by 168 rowers; and on an upper deck was accommodation for the illustrious visitors who occasionally came on board. The whole of the fittings were of the most gorgeous character. Although propelled mainly by oars, there were 40 mariners employed in other ways to manage the galley. The B. was employed only once a year, when the doge "married the Adriatic." A splendid water-procession was formed, with the doge and the chief notables in the B., and other distinguished persons in gondolas and feluccas; and when the vessels arrived at the mouth of one of the channels opening into the Adriatic, the doge dropped a ring into the water, using the words: "We wed thee with this ring in token of our true and perpetual sovereignty." This singular ceremony, which took place on Ascension day, arose out of an honor or privilege conferred by the pope on the doge in 1177, consequent on a splendid victory gained by the Venetians over the emperor Frederick Barbarossa.

BUCEPHALUS (Gr. meaning "ox-head"), the name of the favorite charger of Alexander the great, was probably also the name of a peculiar breed of horses in Thessaly. According to tradition, Alexander in his boyhood was the first to break in the steed B., and thus fulfilled the condition stated by an oracle as necessary for gaining the crown of Macedonia.—The town BUCEPHALIA, on the river Hydaspes, in India, was founded near the grave of B. which died during Alexander's Indian expedition.

BUKER, MARTIN, one of the church reformers of the 16th c., was b. 1491, at Schlettstadt in Alsace. His real name was *Kuhhorn* (cow-horn), but in accordance with the fashion of his time among scholars, he changed it into its Greek equivalent, Bucer being derived from *bous*, an ox, and *keras*, a horn. At the age of 14 he entered the order of Dominicans. At the suggestion of his superior, he went to Heidelberg to study theology, devoting his attention, however, at the same time to the Greek and Hebrew languages. While young he was appointed chaplain to the elector of the palatinate. An acquaintance with the works of Erasmus had already inclined B. toward Protestantism,

and his views were confirmed by the influence of Luther at the Heidelberg disputations in 1518. Following the example given by Luther at the diet of Worms (1521), B. became one of the boldest and most decided of the German reformers. In 1523, he went to Strasburg, where he introduced the doctrines of the reformation. In the disputes between Luther and Zwingli, he adopted a middle course, and endeavored to make reconciliation between them; but his view of the sacraments, which approached that of Zwingli, exposed him to Luther's harsh reprobation. At the diet of Augsburg, where he conducted himself with great circumspection and moderation, he generally accorded with the Lutheran views; but, along with other Stasburg theologians, declined to subscribe to the proposed confession of faith, and afterwards drew up the *Confessio Tetrapolitana*. An agreement, however, was subsequently entered into between B. and the Lutherans, and as a disciple of Luther, he appeared at the religious conference of the reformers held at Leipsic. In consequence of his refusal to sign the *Interim*—a temporary creed drawn up by order of the emperor Charles V.—B. found his situation irksome in Germany, and therefore accepted the invitation of archbishop Crammer (1549), and came to England to teach theology at Cambridge, and assist Paul Fagius and others in forwarding the reformation. His modesty, blameless life, and great learning gained many friends in England; but his labors were soon interrupted by death, Feb. 27, 1551. His remains were interred in a church at Cambridge with great solemnity; but during the reign of Mary, his bones, with those of Fagius, were taken from their graves and burned in the market-place. His constant attempts to express himself in language agreeable both to Luther and Zwingli, induced in him at times an obscure, ambiguous, and elusive kind of thought, to which, perhaps, Bossuet refers when he stigmatizes B. as "the great architect of subtleties." B. was, of course, exposed to many censures and scandals by the assiduous malice of the Roman Catholic theologians, whose fertile imaginations during the reformation period were exclusively devoted to the manufacture of indecent calumnies; but by Protestant writers he has been highly commended, and by some has been ranked above even Luther and Melancthon. His best work is a translation and exposition of the Psalms, which he published under the pseudonym Aretinus Felinus (Strasburg, 1529). Hubert intended to edit the whole of B.'s writings in ten volumes, but only one volume appeared (Basel, 1577).

BU CEROS. See HORNBILL.

BUCH, LEOPOLD VON, one of the most celebrated of German geologists, was b. at Stolpe, in Prussia, in 1774 or 1777, and received instruction under Werner at the mining academy, Freiburg. He afterwards traveled in pursuit of his favorite science, through all the states of Germany, through Scandinavia, as far as the North cape, and through several parts of Great Britain, France, and Italy, visiting the Canary islands in 1815. His chief writings are—*Geological Observations during Travels in Germany and Italy* (1802–1809); a *Physical Description of the Canary Islands* (1825); *Travels in Norway and Lapland* (1810); and essays *On the Jura in Germany* (1839); and *On the Mountain Systems of Russia* (1840), with several monographs on Ammonites (1832) and other fossils. He was also the author of an excellent geological chart of Germany and its neighboring states, published in 42 plates (2d ed., Berlin, 1832). He died in Berlin, Mar. 4, 1853. B. has been described by an eminent scientific man as "the only geologist who has attained an equal fame in the physical, the descriptive, and the natural history departments of his science. In all these he has been an originator and a discoverer."

BUCHANAN, the n.e. district of Aberdeenshire, consisting of about a fourth of the county, lying between the Ytham and the Doveran. Its surface is undulating, the highest points being Mormond hill in the n., 742 ft., and Dudwick hill in the s., 562 feet. Portions of the coast are bold and precipitous, especially for a few m. e. of the Doveran mouth, where Troup head is 600 ft. high, and s. of Peterhead, where the coasts rise from 70 to 100 feet. Among the rocks five m. s. of this town are the famous Bulers of B., a huge vertical well in the granite margin of the sea, 50 ft. diameter, and 100 ft. deep, into the bottom of which the sea rushes by a natural archway, and, in storms, dashes up the sides with great violence. The eastern parts of B. consist chiefly of granite and gneiss, and the western of clay-slate and old red sandstone. The chief seats of population are Peterhead, Fraserburg, Macduff, and Turriff. B. contains several so-called Druid circles, as well as the remains of the abbey of Deer, and of several castles belonging to the Comyns, who held the earldom of B., but forfeited their title and property in 1309.

BUCHANAN, DAVID, 1780–1837; an officer in the British navy who spent many years in explorations in the north polar seas. In 1810, he commanded a schooner on the Newfoundland station, and made a trip up the river of Exploits, the largest stream in Newfoundland. In 1818, he commanded an arctic expedition for the discovery of the north pole. He reached 80° 34', but was caught in the ice and drifted about between Greenland and Spitzbergen until his vessel was disabled, when he managed to return to England. In 1823, he was commander on the Newfoundland station, and in 1825 high-sheriff of the colony. A few years later he sailed again for the arctic seas, and was never afterwards heard from. He made many important scientific observations concerning the variation of the needle and ocean currents.

BUCHANAN, a co. in n.e. Iowa, watered by tributaries of the Red Cedar river; 576 sq. m.; pop. '70, 17,034; in '80, 18,090. It is tolerably level and well timbered. The Dubuque and Sioux City railroad traverses the co. near the central portion. Productions chiefly agricultural. Co. seat, Independence.

BUCHANAN, a co. in n.w. Missouri, on the Missouri river; 450 sq. m.; pop. '70, 35,109—1953 colored. Five railroads, or their branches, traverse the county. The soil is fertile; productions chiefly agricultural. Co. seat, St. Josephs.

BUCHANAN, a co. in s.w. Virginia, on the Kentucky border, bounded n.w. by the Cumberland mountains; 500 sq. m.; pop. '70, 3777; in '80, 4330. The surface is rough and much of it mountainous. Agriculture is the chief occupation. Co. seat, Buchanan.

BUCHANAN, CLAUDIUS, D.D., 1766—1815; an English missionary; in 1796, chaplain to the East India company. He wrote *Christian Researches in Asia*, and other works which had much influence in stimulating and supporting missions.

BUCHANAN, FRANKLIN, b. Md., about 1800; a midshipman in 1815, and in 1845 the first superintendent of the U. S. naval academy. In 1855, he was made a capt., and in 1861 had command of the Washington navy-yard. He resigned when the rebellion broke out, but as his state did not leave the union, he asked to be restored. This was refused, and he went over to the confederates, having command of the *Merrimac* in the attack upon the union fleet in Hampton Roads, in which engagement he was wounded. Two years later, as admiral he commanded the confederate fleet so thoroughly defeated by Farragut in Mobile bay. On that occasion he was wounded and taken prisoner, but released when the war closed.

BUCHANAN, GEORGE, one of the most learned men of the 16th c., and a distinguished poet and historian, was b. of poor parents in Killearn, in the co. of Stirling, in Feb., 1506. He was sent to the university of Paris by his uncle, who died two years afterwards, leaving B. without the means of prosecuting his studies. He returned home, served in one campaign against the English, and entered St. Andrews university in 1524, where, in the following year, he took his degree of B.A. In 1526, he went to Paris, and became a student in the Scots college there. He subsequently obtained a professorship in the college of St. Barbe, but returned to Scotland about 1537. During his residence on the continent, B. adopted the tenets of the reformed faith. A satire entitled *Somnium*, exposing the Franciscans, brought down upon him the wrath of the priests; and he had resolved upon seeking safety in his old college at Paris, when king James V. took him under his protection, and intrusted him with the education of one of his illegitimate sons. At the request of the king, B. wrote another and more pungent satire against the monks, entitled *Franciscanus*, increasing their anger, and rousing especially the bitter hatred of the powerful cardinal Beaton, who after a time procured B.'s arrest, and even went so far as to offer the king money for his life. Though to James was entirely due the publication of the offensive satire, he did not interfere to protect the poet, who, however, contrived to effect his escape to Paris. After spending some years at Bordeaux and Paris in tuition, he accompanied the learned Portuguese, Govea, to the university of Coimbra, in Portugal, as one of his associates. After the death of Govea, B. was arrested as a heretic, and was for some time detained in a monastery, where he began his splendid Latin metrical version of the Psalms. In 1551, being restored to liberty, he went to England; but soon afterwards went to Paris. About 1560, he returned to Scotland, where he made an open confession of Protestantism. His reputation as a scholar gained for him a good reception at the court of the young queen, Mary, whose classical tutor he became. But his religious and political principles attached him to the party of the regent Moray, by whose influence he was appointed principal of St. Leonard's college, in St. Andrews university, in 1566. In the following year, he was chosen moderator of the general assembly—a very high honor for a layman. The doings of Mary, which scandalized the Scottish public, disgusted her tutor also, and he accompanied the regent Moray to England, in order to give evidence against her before the commissioners appointed by Elizabeth to inquire into her guilt. His *Detectio Mariæ Regina*, laid before these functionaries, was industriously circulated by the English court. In 1570, B. was appointed tutor to the young king, James VI. (afterwards James I.), who owed to him all the erudition of which in later life he was so vain. No considerations of the future position of his pupil were allowed to interfere with B.'s treatment of him, which was strict, if not even stern; and in dedicating his *De Jure Regni apud Scotos* to the young monarch in 1579, he warned him against favorites with a freedom remarkable not only in a subservient but in any age. In 1570, B. was appointed director of chancery, which he soon resigned, and in the same year was made keeper of the privy seal, an office which he retained until within a short time of his death. The latter years of his life were devoted to the composition of his *History of Scotland* (published in 1582). He died thirty days after its publication, on the 28th Sept., 1582, and was buried in Greyfriars churchyard, Edinburgh. As a scholar, B. was unrivaled in his age; and he wrote Latin poetry "with the purity and elegance of an ancient Roman." He was alike humorous, sarcastic, and profound. His *History*, written in Latin, is remarkable for the richness, force, and perspicuity of its style, though it has been found fault with for the partiality of its narration of contemporary events; and two years after the author's death, it, as

well as *De Jure Regni*, etc., was condemned by the Scottish parliament, and every person possessed of copies was ordered to surrender them within 40 days, in order that they might be purged of "the offensive and extraordinary matters" they contained. Two collected editions of B.'s works have been published—one by Ruddiman in 1715, 2 vols. folio; and another by Burman, Leyden, in 2 vols. quarto, in 1725. The translations that have yet appeared are far from doing justice to the original.

BUCHANAN, JAMES, a distinguished American statesman, was b. in Franklin co., Penn., April 13, 1791. He was educated at Dickenson college, adopted the profession of the law, and, in 1814, was elected a member of the Pennsylvania house of representatives. In 1820, he was chosen a member of congress, and remained so till Mar. 4, 1831. In May of that year, he was nominated ambassador to Russia. He returned to the United States in 1834, and soon after was elected a member of the senate; he was re-elected in Dec., 1836, and 1843. Appointed by president Polk, in Mar., 1845, secretary of state, he held that office till the close of Polk's presidency. Ambassador to England in 1854, B. resigned that post the following year, and in 1856 was elected president of the United States. His administration was, on the whole, popular. He was in favor of the maintenance of slavery, but when the civil war broke out he warmly embraced Lincoln's policy. He died June 1, 1868.

BUCHANAN, JAMES (*ante*), the 13th elected president of the United States, filling the 18th presidential term (1857-61); b. at Stony Batter, Franklin co., Penn., April 22, 1791; d. Lancaster, Penn., June 1, 1868. He was the son of an Irish emigrant and an American mother, educated at Dickinson college, bred to the law, and admitted to practice in 1812. Though a professed federalist, he served as a private in the war with England. In 1814, he was a member of the Pennsylvania legislature, and in 1820 was elected to congress, where he served through five terms. In 1828, he favored Jackson for president, and in the congress of 1829-31 was chairman of the committee on the judiciary. After leaving congress, Jackson sent him as minister to Russia, where he concluded the first commercial treaty between the two countries, securing valuable privileges in the Black and Baltic seas. In 1833, he was chosen to the United States senate, where he supported Jackson, especially in the claim that appointments might be made by the president alone when the senate was not in session. When it was proposed to exclude from congress petitions for the abolition of slavery, B. desired to prevent even the discussion of slavery by congress, proposing to leave the matter solely to the slaveholding states, and holding that congress had no power over it. He favored the recognition of Texan independence, and the annexation of that republic to the United States. In the affair of the French indemnity, he supported Jackson's demand for payment or war. During Van Buren's administration Buchanan supported the independent treasury scheme; favored the pre-emption of public lands, and opposed the bill to prevent the interference of federal officers in elections. He sustained the veto power under Tyler, and opposed the ratification of the Ashburton treaty, which settled the dispute concerning the northern boundary. When the question of the annexation of Texas came to the senate there were but 15 votes in its favor, but the measure was carried in the form of joint resolutions only three days before the close of the term of congress. B. was the only member of the senate committee of foreign affairs to report in favor of annexation. Polk made him secretary of state. In this position he had to deal with the north-western boundary question, whence arose the famous partisan cry "54° 40' or fight." Both England and the United States had formally claimed the territory between the Pacific coast and the Rocky mountains up to the Russian boundary, but after much negotiation the line of 49° n. lat. was agreed upon. During the war with Mexico, B. was busy in avoiding or preventing the interference of other nations. He was in private life during the discussion and adoption of the compromise measures of 1850, but fully approved them. When Pierce came into office in 1853, he sent B. as minister to Great Britain, where he was engaged in endeavors to settle a series of questions concerning Central American affairs. In the course of these duties he was present at the Ostend conference, the object of which was to bring about the sale of Cuba to the United States; but nothing resulted beyond talk. In April, 1856, B. returned to the United States, and in June was nominated for president by the democratic party. The electoral vote was: for Buchanan, 174; for John C. Fremont (candidate of the newly organized republican party), 114; for Millard Fillmore (native-American), 8. The popular vote was: Buchanan, 1,838,169; Fremont, 1,341,264; Fillmore, 874,534; majority against Buchanan, 377,629; plurality for him, 496,905. He had the votes of every slaveholding state except Maryland, which went alone for Fillmore. The vote for Fillmore also gave Buchanan California and New Jersey. In the executive chair his effort was to smother and put out of sight the agitation concerning slavery not only in new states, but everywhere. Among other acts of his administration was the temporary pacification of the Mormon troubles, and the vetoing of the homestead bill. After Lincoln's election, B. was more than ever anxious to suppress the slavery discussion, and pointedly accused the north, in his last message to congress, of being responsible for the unwarrantable agitation which had "produced its malign influence on the slaves, and inspired them with a vague idea of freedom." While holding that the executive ought to take care that the laws be faithfully executed, he shrank before the secession of South Carolina, declaring that he could not employ force except upon the demand of the lawful authorities of the state,

and in South Carolina no such authority then existed. His argument was that, if a state had withdrawn, or was even attempting to withdraw, from the union, there was no power in the constitution to prevent the act. A few days later he was confronted by commissioners from South Carolina (that state having passed an act of secession on the 20th Dec., 1860), who came to demand the surrender by the president to the seceded state of all public property, and to negotiate for the continuance of "peace and amity between that commonwealth and the government at Washington." His reply was that he had no power, and could only submit the matter to congress; he could only receive them as "private gentlemen of the highest character," and treat respectfully such propositions as they might make. He did, however, decline to accede to their demand for the removal of the troops from Charleston harbor. The cabinet immediately broke up. Gen. Cass was secretary of state, but resigned when the president refused to order reinforcements to the Charleston ports; the secretary of the treasury and the secretary of the interior had already gone; Floyd, secretary of war, resigned because the president refused to withdraw the troops. The last official act of president Buchanan of any importance was characteristic of his whole course where the south and its institutions were concerned. It was embodied in a letter from the secretary of war (Holt) to the governor of South Carolina (Jan. 5, 1861), which declared, "by order of the president," that "the forts in that state, in common with the other forts, arsenals, and property of the United States, are in charge of the president, and that if assailed, no matter from what quarter or under what pretext, it is his duty to protect them by all the means which the law has placed at his disposal;" adding that it was not his present purpose to garrison the forts, as he "considered them entirely safe under the protection of the law-abiding sentiment for which the people of South Carolina had ever been distinguished; but should they be attacked or menaced with danger of being seized or taken from the possession of the United States, he could not escape from his constitutional obligations to defend and preserve them." After the installment of his successor, B. retired altogether from public affairs, but a year or two after the rebellion had been put down, he published a defense of his administration and the measures he adopted for the preservation of peace. He was never married.

BUCHANAN, ROBERT, b. 1841; a poet of Scotland, educated at Glasgow university. In 1860, he published *Undertones*, a volume of verses; in 1865, *Idyls and London Poems*. In the same year he edited *Wayside Posies*, and translated ballads from the Danish. Among later works are *Napoleon Fullen—a Lyrical Drama; The Land of Lorne, including the Cruise of the Fern to the Outer Hebrides; The Drama of Kings; On the Fleishly School of Poetry* (a severe criticism of some living English poets); *Master Spirits; A Mad Prince* (acted at the Haymarket); and his poems collected in 3 vols. in 1874.

BUCHANITES, an extraordinary sect of fanatics, which sprang up in the w. of Scotland in 1783, but has now become extinct. The founder of the sect was Mrs. or Lucky Buchan, b. in Banffshire in 1738, of humble parentage. Her maiden name was Elspeth Simpson. She early fell into habits of vice, but with her licentiousness were combined a sort of religious fervor and extreme antinomian opinions. In 1782, being resident in Glasgow with her husband, a potter, who ultimately divorced her, she became acquainted with the Rev. Hugh White, minister of the Relief congregation in Irvine, a weak vain man and coarse declamatory preacher, who adopted her opinions, for which he was deposed by his presbytery, and began along with her to found a new sect in Irvine. Popular tumults arose, which led to her expulsion from the town in May, 1784. Mr. White and his wife, with other devoted adherents, male and female, accompanied her, regarding her as a divinely commissioned person, and expecting her to lead them to the place where Christ was speedily to appear again on earth. She was addressed as "friend mother in the Lord," and among other more blasphemous pretensions, gave herself out to be the woman mentioned in Rev. xii., White being represented as the "man-child" whom she had brought forth. She and her followers traveled towards Nithsdale, and found a resting-place in a barn at New Cample, near Thornhill, where they afterwards built for themselves a house of one apartment with a loft, in which they all dwelt, supported chiefly by the money of the more wealthy of their number. A few additional persons joined them. They lived in expectation of being translated to heaven without death; and on one occasion, after a fast of extraordinary duration, by which many of them were reduced to a very spectral condition, were led out by their prophetess to a hill-top to be immediately taken up, but returned disappointed. After this, dissensions began to arise among them; and some, recovering from their infatuation, left the society. Their expected heaven was one of mere sensual delights; and it is now sufficiently ascertained that they lived in unrestrained sexual intercourse—for they condemned marriage as unworthy of Christians—and that they systematically practiced infanticide. Yet they were protected from the outbreaks of popular indignation, and no investigation was made by the authorities. On the failure of their means of subsistence, they took a farm in a moorish part of the stewardry of Kirkcudbright; and those who remained of them accumulated by their industry the means of purchasing a small property, on which was built the first house of the village of Crocketford, where they finally became extinct, the last of them surviving till 1846, full even in his old age of the strange delusions of his youth, and preserving in his house

the bones of Lucky Buchan, which were buried with him in his grave.—See *The Buchanites from First to Last*, by Joseph Train. (Edin. 1846.)

BUCHAN-NESS, the easternmost promontory of Scotland, in the n.e. of Aberdeenshire, 3 m. s. of Peterhead, in lat. 57° 28' n., and long. 1° 46' west. A light-house, 130 ft. high, with a revolving light, has been erected here. It may be stated that the low rocks at Peterhead stretch a little further e. than the Buchan-ness. In the sea off the B. lie the Buchan Deepes, a great trough 50 to 90 fathoms deep, and 25 m. broad, and stretching s. nearly as far as the Bell-rock. Outside lie the Long Forties, a bank at the depth of 35 to 45 fathoms, and 10 to 20 m. broad.

BUCHAREST, **BUKHAREST**, or **BUKHOREST**, the chief city of Wallachia, and capital of Roumania, in a rich and extensive plain on the Dumbovitzza, a tributary of the Argish, in lat. 44° 26' n., and long. 26° 5' east. The town is for the most part meanly built, and the streets are very irregular and generally unpaved. There are, however, some handsome hotels; and the churches are numerous and many-spired, giving to the place a picturesque appearance. The prince's palace, a large structure in the center of the town, has no claim to architectural beauty. The number of cafés and gambling-tables is excessive; and altogether B. has the unenviable reputation of being the most dissolute capital in Europe. The *corso*, or public promenade, is a miniature Hyde Park. B. is the entrepot for the trade between Turkey and Austria, the chief articles of commerce being grain, wool, salt, honey, wax, building-timber, and cattle. It has some small manufactures of woolen cloths and carpets. B. has at various times suffered considerably at the hands of the Russians, and is remarkable as the place where in 1812 a treaty was concluded between Turkey and Russia, by which the former ceded to the latter the province of Bessarabia and a portion of Moldavia; Russia waiving her claim to all other territories she had conquered. This treaty also defined the Pruth as the boundary-line between the two empires. During the Crimean campaign, B. was successively occupied by Russians, Turks, and Austrians. Pop. '66, 141,754; '75, estimated at 250,000.

BUCHEZ, **PHILIPPE BENJAMIN JOSEPH**, a French physician, writer, and president of the national assembly in 1848, was b. in 1796 at Matagne la Petite, in the department of Ardennes, and studied medicine in Paris, 1815. He became involved in several plots against the Bourbons, was active in the conspiracy of the French Carbonari (q.v.), and supported the doctrines of St. Simon (q.v.); but, after editing for some time the communist journal *Le Producteur*, he separated from his colleagues. Curiously enough, during all his active career of underhand politics, he was prosecuting his learned studies, and in 1825 published a *Précis Élémentaire d'Hygiène*, besides editing the *Journal des Progrès des Sciences et Institutions Médicales*. After the revolution, 1830, B. established and conducted the journal *L'Européen*, the organ of Neo-Catholicism; and in concert with M. Roux Lavergne, began a republican history of the French revolution. All his writings are marked by original views and arguments in favor of the belief in human progress. After the Feb. revolution, 1848, B. was made president of the national assembly; but by his want of energy during the disturbance of May 15, he incurred the censure of all parties. On the inauguration of the empire, B. returned to his studies. He died in 1866.

BUCHNER, **FRIEDRICH KARL CHRISTIAN LUDWIG**, b. 1824; a German atheistic philosopher. He was a practicing physician, in the school of Tubingen, whence he was removed because of his publication of the doctrine that nothing beyond material force is known to man (published in English as *Force and Matter*). The main ideas of his doctrines are the eternity of matter, the indestructibility of force, the co-existence of light and life, and the infinity of forms of being in time and space. His works have been widely circulated in his own and other languages.

BUCHU. See **BUCKU**, *ante*.

BUCK, a name sometimes distinctively appropriated to the male of the fallow deer (q.v.), the female of which is a *doe*. But the term B. is often also applied to the male of other species of deer, as of the roebuck (q.v.), although never to that of the red deer (see **DEER**), which, when mature, is a **STAG** or a **HART**.

BUCKAU, a t. in Saxony on the Elbe, adjoining Magdeburg; pop. '71, 9696. It has extensive machine works, and several important manufactories.

BUCKBEAN, or **MARSH TREFOIL** (*Menyanthes trifoliata*), a plant of the natural order *gentianææ* (q.v.), the only known species of its genus, widely distributed in all the colder parts of the northern hemisphere, and common in Britain. It has been described as "perhaps the most beautiful" of all British plants. It grows in marshy places, its creeping root-stalks (or rhizomes) and densely matted roots often rendering boggy ground firm. The leaves are ternate, like those of the trefoils or clovers, and are supported on pretty long stalks. The flower-stalk bears a compound raceme of 10 to 20 white flowers, externally tipped with red. The calyx is 5-parted; the corolla funnel-shaped, with a spreading 5-lobed limb, shaggy on the inner surface, with thick fleshy hairs. The fruit is a one-celled, two-valved capsule. The leaves are destitute of smell, but very bitter. From them is prepared a valuable bitter extract, which has long been used in cases of dyspepsia and disorders of the bowels, and which was also formerly employed in intermit-

tent fevers. An infusion is also sometimes used, and sometimes the dried and powdered leaves. The whole plant seems to possess the same bitter and tonic properties. It is sometimes used in Germany as a substitute for hops. The root-stock, however, which is black and jointed, contains a considerable quantity of a kind of starch, which is separated from the bitter substance, and used as food in some of the northern parts of Europe.

BUCKEYE. See HORSE CHESTNUT.

BUCK-HOUND, a hunting-dog once common in Britain, when buck-hunting was a most fashionable amusement, but of which few packs now exist. The buck-hound resembles a dwarf STAG-HOUND (q.v.), and possesses great strength and perseverance. Bucks are, however, often hunted by other kinds of hounds.

BUCKINGHAM, a co. in central Virginia on the James and Appomattox rivers, traversed by the James canal; pop. '70, 13,371—7711 colored. The surface is hilly, but the soil near the rivers is good. There is a gold mine near Willis mountain, and iron and slate are found. Co. seat, Marysville.

BUCKINGHAM, the old co. t. of Buckinghamshire, in the n. part of the shire, is situated on the Ouse—which flows round the town, and has three bridges. B. is 61 m. n.w. of London by rail. It returns one member to parliament. Pop. '71, 7545. Bobbin lace is the chief manufacture, but it is on the decline. B. is a place of considerable antiquity. Edward the elder fortified it in 978, and the Danes captured it in 1010. The earls of Buckingham built a castle here soon after the Norman conquest. Edward III. made it a staple for wool. Here Catharine of Aragon received the news of the battle of Flodden, and Charles I. had his head-quarters in B. for a few days in 1644.

BUCKINGHAM, Duke of, **GEORGE VILLIERS**, the favorite of James I. and Charles I. of England, third son of sir George Villiers, was b. at his father's seat of Brookesley, Leicestershire, Aug. 20, 1592. Knighted in April, 1616, and sworn a gentleman of the bed-chamber on Jan. 1, 1617, he became master of the horse and a knight of the garter. Created the same year baron of Whaddon and viscount Villiers, and in Jan. following earl of B., and sworn of the privy-council, he was next made a marquis, and appointed lord-admiral of England, chief-justice in Eyre of parks and forests s. of the Trent, master of the king's bench office, high steward of Westminster, and constable of Windsor castle. In 1620, he married the daughter of the earl of Rutland, the richest heiress in the kingdom. In 1623, while negotiations were in progress with the Spanish court for a marriage between the infanta and the prince of Wales, afterwards Charles I., B. persuaded the latter to go himself to Madrid and prosecute his suit in person. The ultimate failure of the negotiations has been ascribed to B.'s arrogance. In his absence he was created a duke, and on his return nominated lord-warden of the cinque ports, and steward of the manor of Hampton court. By his advice, James declared war against Spain. On the accession of Charles I., in 1625, B. maintained his ascendancy at court, but after the ill-fated expedition against Cadiz, he became odious to the nation, and was saved from impeachment only by the king's dissolving parliament. The treaty for the marriage of Charles with the princess Henrietta of France was concluded by him, but he was not allowed to return to Paris, in consequence of his audacity in lifting his eyes to the French queen. In 1627, with an armament of 100 sail and 7000 soldiers, he appeared before Rochelle, then in possession of the Huguenots, who refused him admission within the harbor. His troops then made an ill-conducted descent on the neighboring isle of Rhé, and returned to England beaten and disgraced. He soon after undertook a second expedition to Rochelle, and proceeded to Portsmouth for embarkation, when he was assassinated by a discontented subaltern-officer, named Felton, Aug. 23, 1628, in his 36th year.

BUCKINGHAM, 2d Duke of (**GEORGE VILLIERS**), a brilliant but profligate nobleman, son of the preceding, was b. at Wallingford house, Westminster, Jan. 30, 1627, and studied at Cambridge. On the outbreak of the civil wars, he served in the royal army; his estates were confiscated by the parliament, and he took refuge on the continent. He attended Charles II. into Scotland, and after the battle of Worcester, in 1651, went again into exile. Returning secretly into England, he married, in 1657, the daughter of lord Fairfax, the parliamentary general, to whom his forfeited estates had been assigned. Arrested by Cromwell, and committed to the Tower, he was afterwards removed to Windsor castle, but released on the abdication of Richard Cromwell. At the restoration, he recovered his estates, and was made master of the horse, and sworn of the privy-council. He was mainly instrumental in the fall of the chancellor, Clarendon, whom he made an object of ridicule to the king, and was one of Charles's confidential ministers, who, from the initial letters of their titles, were called "the Cabal." Engaging in 1666 in some treasonable practices for effecting a change in the government, he was deprived of all his offices at court, but, on his submission, soon recovered them. In 1670, he was sent ambassador to France, and was employed on some other embassies. He was elected chancellor of the university of Cambridge in 1671. Supporting the non-conformists in 1674, he opposed the test act, and was deeply engaged in the popish plot. After Charles's death, in 1685, B. retired to his manor of Helmsley, in Yorkshire, and amused himself with the chase. He died at Kirkby-Moorside, April 16, 1688, and was

interred in Westminster abbey. The manufacture of glass and crystal is said to have been introduced into England from Venice by him. B. was the author of several stage-plays, of which the best is *The Rehearsal*, a comedy; *A Satire against Mankind*; and some poems.

BUCKINGHAM, JAMES SILK, a modern traveler and popular lecturer, the son of a farmer, b. in 1786, at Flushing, near Falmouth, Cornwall; when a boy, went to sea, and made several voyages to Lisbon. After years of unsettled and wandering life, he, in 1816, established a journal at Calcutta, but the boldness of his censures on the Indian government led to his expulsion from the presidency of Bengal. His lectures, on his return to England, against the East India company monopoly, and in support of opening the trade to China, tended greatly to direct public attention to the subject. In London, he established *The Oriental Herald*, and *The Athenæum*, now the leading weekly literary journal. Subsequently, he traveled through the United States, and from 1832 to 1837 was M.P. for Sheffield. He was projector and secretary of the British and foreign institute, literary club, 1843-1846; and president of the London temperance league, 1851. B. was the author of numerous works of travel on the continent, in the east, and in America. He was engaged on his autobiography, two volumes of which were published before his death, which took place June 30, 1855.

BUCKINGHAM, JOSEPH TINKER, 1779-1861; an American journalist, native of Connecticut. He was bred a printer, and in 1800 went to Boston, where, six years later, he began *The Polygraph*, a monthly magazine, which was soon suspended, but resumed in 1812. In 1809, he published a weekly called *The Ordeal*; from 1817 to 1828, *The New England Galaxy and Masonic Magazine*; and, in 1831, *The New England Magazine*. In 1824, he started the *Boston Courier*, of which he was editor until 1848. On the 24th of June, 1840, he presided over the celebration (in Boston) of the four hundredth anniversary of the invention of printing. As an editor he was a vigorous writer, but rather bitter and personal. He was several times elected to the legislature. Besides his ordinary work, he published *Specimens of Newspaper Literature, with Personal Memoirs, Anecdotes, and Reminiscences*, and *Personal Memoirs and Recollections of Editorial Life*.

BUCKINGHAM, WILLIAM ALFRED, LL.D., 1804-75; the "war governor" of Connecticut (1858-66), noted for his zeal and untiring energy in support of the union cause during the rebellion. Before his election as governor he was a carpet manufacturer and merchant. In 1869, he was elected U. S. senator. Among his benefactions was \$25,000 to the theological school of Yale college.

BUCKINGHAM, or BUCKINGHAMSHIRE, JOHN SHEFFIELD, Duke of; 1649-1721; son of the second earl of Mulgrave. In the war with Holland, he served in the navy and commanded a ship; and afterwards, in the land forces, he joined Turenne to study the art of war. James II. made him lord chamberlain and one of the privy council. He acquiesced in the revolution and was in the cabinet of William III.; and, on the accession of Anne, with whom he was a personal favorite, he received the privy seal and became lord lieutenant of the North Riding of Yorkshire. He sided with the tories, and held last the dignity of lord president. He wrote two tragedies, and an essay on poetry, and one on satire.

BUCKINGHAMSHIRE, a south-midland county of England, its greatest length being about 54 m., its average breadth 18, and total area 738 sq. miles. The plastic clay tertiary strata occupy the southern parts of the county, which is finely diversified with hill and dale, wood and water. To the n. is a broad chalk-band, including the Chiltern range of chalk-hills, which enter from Oxfordshire, and stretch across the county in a n.e. direction into Bedfordshire, partly covered with heath and wood, and near Ivinghoe and Wendover, above 900 ft. high. Sloping n. from these hills, and crossed by narrower bands of greensand and oolite, is the extensive and very fertile vale of Aylesbury, watered by the Thame. The chief rivers are the Thames, bordering the county on the s.w., the Ouse, Ousel, Colne, and Thame, the latter two falling into the Thames. The Grand Junction canal, and the Great Western and North-western railways, intersect the county on the e. and south. The climate of Bucks is mild and healthy; the soil is mostly good, chalk and clay predominating. About half the county is under tillage, the rest in meadows and pasture. The agriculture is not equal to the capabilities of the land, which is often overcropped and exhausted. The farms are generally small, averaging 200 acres. The cottages are generally good. Wheat and beans are the principal crops. The chief dairy product is butter, of which four to five millions of pounds are annually sold, chiefly in London. In the vale of Aylesbury, fattening of cattle is extensively carried on; the sheep are noted for their fine and heavy fleeces; and large numbers of ducks are reared for metropolitan consumption. In 1875, the number of cattle in the county was 68,831; sheep, 202,383; and pigs, 35,370. Beech and oak are the chief timber-trees, but box and juniper are also grown. The chief manufactures are paper, straw-plait, and thread-lace. B. returns 8 members to parliament—3 for the county and 5 for the boroughs. The chief towns are Aylesbury, Buckingham, Marlow, and Wycombe. B. contains some Roman and British remains, as traces of Watling, Ickneld, and Akeman streets or ways. The chief ecclesiastical ruins are those of Miss-

enden and Notley abbey, the latter of which has been converted into farm-buildings. There are many examples of early English and decorated architecture. The church of Chetwode, near Buckingham (13th c.), contains some very fine examples of ancient glass-staining. Many events of historical interest occurred in this county. It was the scene of contest in the civil wars of Stephen and John. At Chalfont St. Giles, Milton finished his *Paradise Lost*, and at Horton, he wrote *L'Allegro*. At Hampden lived the great patriot of that name; Waller was proprietor of Beaconsfield manor; Atterbury was born at Milton; Stoke Poges churchyard suggested Gray's *Elegy*, and is the place of his burial; at Olney, Cowper lived; at Gregories, near Beaconsfield, Burke died and was buried; Scott, the Biblical commentator, was rector of Aston Sandford; Herschel's great telescope still stands at Slough, where he made most of his important discoveries; and at Stowe is a magnificent mansion—one of the finest in England, alike for extent, architecture, and beauty of site—formerly belonging to the duke of Buckingham. Pop. '71, 175,879.

BUCKLAND, CYRUS, b. Conn., 1799; a successful inventor, pattern-maker of the U. S. armory at Springfield, Mass., and designer of machinery for making arms. He has produced many new machines and tools in the line of arms manufacturing.

BUCKLAND, FRANCIS TREVELYAN, a son of the rev. Dr. Buckland (q. v.), b. at Christ Church college, Oxford, Dec. 17, 1826. He was educated at Winchester school, and at Christ Church college, Oxford. He devoted himself to the study of medicine; and after being house-surgeon of St. George's hospital, London, was appointed assistant-surgeon to the 2d life-guards in 1854, retiring in 1863. From his boyhood, he manifested an enthusiastic delight in natural history, especially when it could be applied practically to the cultivation of useful quadrupeds, birds, or fish, in which study he was encouraged and guided by his father. He has contributed a vast number of brief papers on various branches of his favorite science to the *Times*, *Field*, *Queen*, *Land and Water* (of which he is editor), etc. He is also the author of *Curiousities of Natural History* (Lond. 1857; second series, 1860; third series, 2 vols., 1866); of a work entitled *Fish-hatching* (Lond. 1863); and *Logbook of a Fisherman and Zoologist* (1876); and editor of a new edition of his father's Bridgewater treatise (Routledge, 1858); and of *White's Selborne* (1876). He was first secretary to the acclimatization society of Great Britain and Ireland. He is an acute observer, and his writings on subjects of natural history in great part exhibit the results of fresh and original observations, which his sprightly style exhibits in a most interesting manner. He has long taken a great interest in fish-culture, and has been actively concerned in the recent endeavors to promote it in England. He has, at his own cost, established under the science and art department, South Kensington, a "museum of economic fish-culture," illustrating the natural history of salmon and sea-fish by means of plaster-casts, which he makes with his own hands, and by preparations and dissections in spirits. In 1867, B. was appointed inspector of salmon fisheries for England and Wales, and, in 1870, special commissioner on the salmon fisheries of Scotland, and in 1877 on the Scotch herring fisheries.

BUCKLAND, WILLIAM, D.D., a distinguished geologist, whose labors tended greatly to the advancement of science, was born at Axminster, Devonshire, England, in 1784. Educated at Winchester and Oxford, he was appointed, in 1813, reader in mineralogy in Oxford university. The same year, he was elected a fellow of the geological society, and he was twice its president. In 1818, he became reader in geology at Oxford, and was elected fellow of the royal society. In 1822, he received the Copley medal for an account of an assemblage of fossil teeth and bones of 22 different animals, discovered in a cave at Kirkdale, Yorkshire; and, in 1823, he published a treatise founded on it, entitled *Reliquiæ Diluvianæ, or Observations on Organic Remains, attesting the Action of a Universal Deluge*, a theory which he afterwards saw cause to modify. In 1825, B. was appointed a canon of Christ church, Oxford. In 1827, he was chosen a member of the council of the royal society; in 1832, he was elected president of the British association at Oxford, its second meeting; and, in 1836, he published his Bridgewater treatise, *Geology and Mineralogy Considered with Reference to Natural Theology* (2 vols. 8vo). To the transactions of the geological society he contributed many valuable papers; and his sketch of the structure of the Alps, in the *Annals of Philosophy*, is esteemed one of the most interesting of his geological writings. In 1845, he was made dean of Westminster, and, in 1847, a trustee of the British museum. Under his great and continuous labors to benefit others, his mental faculties gave way some years before his death, which took place Aug. 14, 1856.

BUCKLANDIA, a magnificent and beautiful evergreen tree of the natural order *hamamelidææ* (see WITCH-HAZEL), a native of the mountains. It grows unbranched to the height of 40 ft., the trunk sometimes 21 ft. in girth at 5 ft. from the ground. The foliage is thick, bright, and glossy. The timber is not valuable. Dr. Hooker thinks that this tree would probably succeed in the mild climate of the w. of England.

BUCKLE, HENRY THOMAS, an author who attained a sudden notability in 1857 by the publication of the first volume of a work entitled *The History of Civilization in England*. He was born at Lee, in Kent, Nov. 24, 1823, and was for a very short time at Dr. Holloway's school in Kentish-town, near London. No other school and no

university claims credit for his education, which, nevertheless, was in the highest degree liberal. An easy fortune and a large library enabled Mr. B. to gratify, without any sort of impediment or restraint, an all-absorbing love of letters. After bringing out a second volume of his work in 1861, he undertook a journey to the east, in order to restore his health and extend his knowledge. Having spent the winter in Egypt, he went over the desert to Syria, caught typhus fever by the way, and died at Damascus, May, 1862.

B.'s plan involved, before tracing the particular history of English civilization, a general consideration of the progress of those European countries, England, France, Germany, Scotland, Spain, and America, in which the elements of modern civilization are originally found. The two volumes published are occupied with this preliminary examination, which they do not even complete. His objects, however, are clear. They are (1) to discover what is the essential spirit of a nation's history apart from particular men and events, and (2) to trace out the causes of the progress which has been made in England and France. Under the first head B. endeavors to show that the spirit or character of a people is dependent on material circumstances, such as soil, climate, food, aspect of nature, and the like, and to be sought for in these; under the second head occurs the theory, the vigorous application of which by B. has startled and offended many readers—viz., that the progress of society depends upon skepticism; that the retarding force is credulity; and that the excessive "protection" exercised by governments, the nobility, the church, etc., over the "people," has dwarfed and held back the spirit of freedom and civilization. These and other positions are defended by B. with great ingenuity and lucidity of argument and expression, and have been admitted, even by his opponents, to contain much sound truth. He is accused—perhaps not unjustly—of being often one-sided, and of drawing sweeping deductions from an imperfect survey of the facts. He is said to have been one of the best chess-players in the world. See his *Miscellaneous and Posthumous Works*, edited by Miss Helen Taylor; and *Pilgrim Memories*, by J. S. Stuart Glennie.

BUCKLER, in old armor, was a kind of shield worn on the left arm. The bucklers worn by the *hastati*, or spearmen, among the ancient Romans, were about 4 ft. long, by 2½ in width, made of boards, covered on the inside with linen and sheepskin, and on the outside with iron plate. In the middle ages the B. was round, oval, or square in shape, and was frequently made of wicker-work or of hide, strengthened by metal-plates.

BUCKLES, metal instruments, consisting of a rim and tongue, used for fastening straps or bands in dress and harness. The use of B., instead of shoe-strings, was introduced into England during the reign of Charles II. They soon became very fashionable, attained an enormous size (the largest being called Artois buckles, after the comte d'Artois, brother of the king of France), and were usually made of silver, set with diamonds and other precious stones. In the latter half of last century the manufacture of B. was carried on most extensively in Birmingham, there being at one time not less than 4000 people employed in that town and its vicinity, who turned out 2,500,000 pairs of B. annually, at the average value of 2s. 6d. per pair. When the trade was at its height, however, fashion changed, and in 1791 we find buckle-makers petitioning the prince of Wales for sympathy, on the ground that the introduction of shoe-strings had nearly ruined their trade. The prince promised to assist them as far as he could, by wearing B. himself, and enjoining his household to do the same; but fashion was too strong even for him, and B. became almost extinct. The opportunity, however, as is remarked by a writer in *Notes and Queries* for 1854, "which buckles afford of ornament and expense has preserved them as a part of the court-dress; and of late years they have appeared a little in private society. They are generally, though not always, worn when a prince of the royal family is of the party; and at the king's private parties, although the rest of the dress be that usually worn, buckles are almost indispensable." Large shoe-buckles, of silver or other metal, are still worn by the clergy of several continental countries, as part of their ordinary costume.

BUCKMINSTER, JOSEPH, D.D., 1751-1812; an American Congregational clergyman, b. Mass. He graduated at Yale, studied theology, and was for a time tutor in the college. In 1779, he became pastor of the North church, Portsmouth, N. H., where he remained for a third of a century, retiring only by reason of failing health. He died soon afterwards, while on a visit to Vermont. Dr. B. took deep interest in the controversy that in his later years divided the Congregationalists into liberals and conservatives. He published many sermons, a memoir of Dr. Mackintosh, and was one of the compilers of the *Piscataqua River Prayer Book*. His daughter published his memoirs and those of his son.

BUCKMINSTER, JOSEPH STEVENS, son of Rev. Joseph, 1784-1812. He was educated at Harvard, and was a teacher in Phillips Exeter academy, having Daniel Webster for one of his pupils. In 1804, he was made pastor of Brattle street church, Boston, one of the leading congregations in New England. In 1806-7, he traveled in Europe, taking a deep interest in the purchase of books for the Boston Athenæum. In 1808, he supervised the republication of *Griesbach's New Testament* (in Greek), and was soon afterwards appointed lecturer on biblical criticism at Cambridge. He was a member of most of the important literary societies of the day. His works have been published in

two volumes. While preparing for his biblical lectures in 1811, he had an attack of epilepsy which broke his intellect, and from its effects he died in the following year.

BUCKNER, SIMON BOLIVAR, b. Ky., 1823; a graduate of West Point who went into the service of the confederacy, issuing an address to the people of Kentucky to take arms against the usurper Abraham Lincoln. He surrendered Fort Donelson and 10,000 troops to gen. Grant; was for a time a prisoner of war, and was finally in Kirby Smith's surrender to gen. Canby.

BUCKS, a co. in e. Pennsylvania, on the New Jersey border, bounded by Delaware river; 600 sq.m.; pop. '70, 64,336; '80, 68,522. It possesses mines and quarries of iron, plumbago, zircon, limestone, and sandstone. Surface hilly but well cultivated. The North Pennsylvania, Philadelphia and Trenton, and Doylestown railroads pass through. Productions, corn, oats, hay, potatoes, butter, tobacco, etc. Co. seat, Doylestown.

BUCKS. See **BUCKINGHAMSHIRE**, *ante*.

BUCKSKIN is a fanciful name for a heavy-made, strong-twilled woolen fabric, for trousers—highly milled to about the usual width for such goods—27 in.; and cropped and finished, with the pile or nap so shorn as to show the texture through it.

BUCKSPORT, a t. in Hancock co., Me., on the Penobscot, 16 m. s. of Bangor; pop. '70, 3433; '80, 3056. It is a handsome town, regularly laid out on a gentle slope. At the bend of the river there is a strong fort commanding the narrows and the river both up and down. As the river seldom freezes here, B. is a convenient winter port for vessels bound to Bangor. There are several ship-yards and manufactories. In the last war with England, B. was captured by the British.

BUCKSTONE, **JOHN BALDWIN**, a distinguished comedian and dramatic writer, was b. in the suburbs of London, in 1802. Preferring the excitement of the stage to the monotony of an attorney's office, he sought and soon found an opportunity in a provincial town for the display of his theatrical abilities. After a probation in the country, he appeared at the Surrey theater in 1823, and his success was so unequivocal, that he was soon engaged by the "management" of the Adelphi theater, where he continued for many years as leading low comedian. He afterwards played at the Haymarket and Drury Lane theaters, of the former of which he was lessee from 1853 to 1878. He died 31st Oct., 1879. B.'s acting was not more noted for its comicality and humor, which never degenerates into vulgarity, than for its distinct appreciation of the peculiar traits in each individual character he assumed. In all his delineations there was the same broad general effect, but the details of each were wrought out with great care and minuteness. B. was also a prolific dramatic author, and of the 150 pieces he is said to have written for the stage, several have been highly popular. Among the best known are *The Green Bushes*; *The Flowers of the Forest*; *Luke the Laborer*; *The Wreck Ashore*; *The Rough Diamond*; *Good for Nothing*; *the Irish Lion*; and *The Alarming Sacrifice*.

BUCKTHORN, *Rhamnus*, a genus of shrubs or small trees of the natural order *rhamnaceæ* (q.v.), distinguished by a bell-shaped 4 to 5-cleft calyx, which divides around the middle after flowering, the upper part falling away, and the base remaining and adhering to the fruit; which is globose, and sometimes succulent, sometimes rather dry or spongy, with 2 to 4 stones. The petals are sometimes wanting. Some of the species are dioecious, some hermaphrodite. They are numerous, and natives of most of the tropical and temperate regions of the world.—The **COMMON BUCKTHORN** (*R. catharticus*) is a deciduous shrub or low tree, frequent in England and in other parts of Europe and the n. of Asia. The leaves are ovate, crenate, and bright green; the branches spiny; the flowers small, yellowish-green, and densely clustered; male and female flowers on separate plants; the berries about the size of peas, globular, bluish-black, nauseous, and violently purgative. They were formerly much used in medicine, but now more rarely, and only in the form of a syrup prepared from their juice. They supply the *sap green* (q.v.) or bladder green of painters. The bark affords a beautiful yellow dye. The B. is sometimes planted for hedges, but is of too straggling a habit.—The **ALDER BUCKTHORN**, or **BERRY-BEARING ALDER** (*R. frangula*), is also a native of Britain, and is frequent in woods and thickets throughout Europe. It is a shrub, rarely a small tree, with spineless branches, oval entire leaves, and small, whitish, axillary flowers, which are in general somewhat clustered. The bark of the twigs is gray, and has a very disgusting smell and a nauseous bitter taste. It was formerly used in medicine, along with that of the last species, and has recently been recommended in many quarters as a remedy for intermittent fevers. It contains principally an acrid bitter extractive, a volatile oil containing hydrocyanic acid, and a yellow coloring matter called *rhamnin*. The berries are small and black, and violently purgative. It is objected to their use in medicine that much sickness and thirst attend it. The charcoal of the wood is light, and is used for the preparation of gunpowder. The bark, leaves, and berries are used for dyeing; the bark for dyeing yellow, and with preparations of iron, black; the unripe berries to dye wool green and yellow; the ripe berries to dye it bluish-gray, blue, and green. The flowers are peculiarly grateful to bees.—**DYER'S BUCKTHORN** (*R. infectariosus*), is a low shrub, abundant in the s. of Europe, whose unripe fruit yields a brilliant yellow dye. The berries and inner bark of *R. tinctorius*, a native of Hungary, are also used in dyeing; and the berries of *R. saxatilis*, a procumbent shrub, growing amongst rocks as far

n. as Switzerland. The *French berries*, *Arignon berries*, or *yellow berries* of dyers, are the fruit of *R. infectorius*, *R. saxatilis*, *R. amygdalina* (or *oleoides*), and *R. Clusii*.—The SEA BUCKTHORN is a shrub of a different genus and order. See SALLOW-THORN.

BUCKU, a name common to several small shrubs of the genus *barosma* (formerly included in *diosma*), natives of the cape of Good Hope, the leaves of which are used in medicine—sometimes in the form of a powder, more generally of an infusion or a tincture—particularly on account of their powerful operation on the urinary organs, as in chronic inflammation of the bladder, urinary calculus, etc. They are also used in dyspepsia, rheumatism, and dropsy; and are stimulant and antispasmodic, diuretic, diaphoretic, and tonic. They generally appear in commerce mixed with stalks and fruit. They are smooth, leathery, and shining, more or less crenated, or serrated, and are much covered with pellucid dots, which are glands filled with a strongly smelling yellowish volatile oil. The strong odor of *B.* leaves is generally regarded as disagreeable, but the Hottentots perfume themselves with them. They have a warm taste, resembling that of mint.—The genus *barosma* belongs to the natural order *rutaceæ*, and is distinguished by regular flowers with 5 petals, 5 fertile and 5 abortive scale-like stamens, anthers bearing a minute terminal gland, and a 5-lobed ovary. The species principally yielding the *B.* leaves of the shops are *B. serratifolia*, *B. crenata*, *B. crenulata*, and *B. tenuista*.

BUCKWHEAT, *fagopyrum*, a genus of plants of the natural order *polygoneæ* (q. v.), or, according to many botanists, a subgenus of *polygonum*, distinguished by the central embryo, and by racemes of flowers grouped in panicles. COMMON *B.* (*fagopyrum esculentum*, or *polygonum fagopyrum*) is a native of the basin of the Volga, the shores of the Caspian sea, and many parts of central Asia, from which it is said to have been introduced by the Moors into Spain, and thence to have extended over Europe, in many parts of which, and in some places in Britain, it is now naturalized. Another account represents it as having been brought to Europe by the crusaders. In France, it is called *blé Sarrasin*, or Saracen wheat. It is cultivated on account of the farinaceous albumen of its seeds, which are used, as grain, for food of man and cattle. It is upright, branched, 1 to 3 ft. in height; the leaves are between heart-shaped and arrow-shaped, the flowers pale red, the seed (nut) black and triangular, the angles even (not toothed). The resemblance of this seed in form to the beech-nut is supposed to be the reason of the German name *buchweizen* (beech-wheat), from which the English name is derived. *B.* is a very common crop in some parts of Europe, and of the United States of North America; but is seldom sown in Britain, except as food for pheasants. It requires continued dry weather in autumn for profitable harvesting, and this in the climate of Britain cannot well be reckoned on. In Germany, *B.* is much valued as a crop, particularly for moorlands and other poor soils. In Bretagne, also, it is as extensively cultivated as wheat. It yields very abundantly, and requires little attention and little manure. Forty bushels or more per acre may be expected, weighing 46 or 48 lbs. per bushel; and notwithstanding the resemblance of the seed to grain in its qualities and uses, wheat, or any other cereal crop, generally succeeds well after *B.*, if care has been taken to keep the land clear by tilling. The seed is most frequently used in the shape of groats, or made into pottage, and in the United States thin cakes are very often made of it. It is very nutritious, containing about 10 per cent of gluten and 52 per cent of starch, besides about 6 per cent of gum and sugar. It is said to be as good as barley for fattening cattle, and better for horses than oats. But as the seed is covered with a very hard rind or thin shell, it must always be shelled before being given to cattle. Poultry are very fond of it. Beer is sometimes brewed from it, and it yields a spirituous liquor of good quality; indeed, it is frequently used in gin-distilleries. As green fodder, the herbage of the plant is said to be more nutritious than clover; but it acts as a narcotic on sheep. Bees delight in its flowers, and in some parts of the United States it is sown on this account. In America the seed is usually sown broadcast over the land which has been plowed in autumn or early spring and well scarified or harrowed. About a bushel and a half of seed is required when sown broadcast, but a bushel is sufficient if drilled with a machine. In the latter case it should not be sown in narrower drills than one foot apart, but 2 ft. is recommended as being better for the succeeding crop, as the wider intervals can be properly cultivated. It should not be sown in England before the middle of May, as the least frost is injurious. When the lower seeds are ripe it should be mown, as they are easily shed out if allowed to stand too long. When bread made from *B.* forms the principal food of the people, it is thought to have an injurious action on the brain. As a supplementary article, however, it is a favorite among all classes where it is raised.—TARTARIAN *B.* (*F.* or *P. Tataricum*) is distinguished by the toothed edges of the seeds and its more vigorous growth. It is hardy, and adapted for cold situations. It is a native of Siberia. It is very productive, but the seed falls out when ripe more readily than that of the common species; and the flour is darker colored, and somewhat bitter.—NOTCH-SEEDED *B.* (*F.* or *P. emarginatum*) is said to be a native of China. Its seeds are larger than those of common *B.*, and their angles are winged. When grown in Britain, many of its flowers are generally abortive.—PERENNIAL *B.* (*F.* or *P. cymosum*) is a native of Nepal, very vigorous in its growth, but producing, at least in Britain, comparatively little seed.—The triangular black seed of climbing *B.* or blackbine (*F.* or *P. convolvulus*), familiar to every one who has eaten oatmeal cakes or porridge, greatly resembles *B.*, but

is smaller. The plant—a very common weed in gardens and cornfields in Britain—also exhibits much similarity, notwithstanding its different habit and twining stem.—DYER'S B. is *Polygonum tinctorium*. See POLYGONÆÆ.

BUCKWHEAT TREE, *Cliftonia ligustrina*, an evergreen shrub in the gulf states of the order cyrtaceæ, bearing fragrant white blossoms. It grows around ponds and streams, and gets its name from the shape of its pendulous fruit. Its local name is "titi."

BUCOLIC, a term derived from the Greek, meaning "belonging to herdsmen," and equivalent to the Latin term *pastoral*. See PASTORAL POETRY.

BUCYRUS, the co. seat of Crawford co., Ohio, on the Sandusky river, 62 m. n. of Columbus; on the Pittsburgh, Fort Wayne, and Chicago railroad; pop. '70, 3066; in '80, 3848. There are mineral springs and a spring of inflammable oil in the neighborhood. It is in a thickly populated district, and is noted for manufactories and schools.

BUCZACZ, a t. of the Austrian empire, in Galicia, 30 m. e.n.e. of Stanislawow, on the Stripa, a considerable affluent of the Dniester. A treaty of peace between the Poles and the Turks was signed here in 1672. Pop. 8500.

BUD, *Gemma*, in botany, that part of a plant which contains the rudiments of leaves or flowers prior to their development. Buds are distinguished into *leaf-buds* and *flower-buds*, the former producing leaves, and having a power of extension into a branch; the latter producing flowers only, and ordinarily destitute of this power of extension. The different parts of the flower being regarded, however, as *leaf-organs* or altered leaves (see FLOWER), the flower-bud may be regarded as merely a modified leaf-bud; and it is well known that, by treatment which checks the luxuriant growth of a plant, it may be caused to produce flower-buds where only leaf-buds could otherwise have been expected to appear—a physiological fact, of which advantage is taken in various ways by gardeners, as by removing portions of the bark and even of the woody part of the stem, root-pruning, confining the roots in a flower-pot, etc. Buds usually appear in the axils of leaves, the terminal bud of a branch being no exception to this rule; and there is no leaf without one or more buds in its axil, although many never pass beyond the most rudimentary state. See BRANCH. In cold and temperate climates, buds are formed about midsummer, beginning to appear as soon as the young branch which bears them has itself been properly developed, and are generally covered with scales and often also coated with resinous matter, by which their tender contents are protected from the severity of winter; but in the trees of warm climates, the protection of scales is generally wanting. Within the leaf-bud, the future leaves may be discovered, often very curiously folded or rolled up, and the different forms and positions which the leaves assume in the bud, are very characteristic of different kinds of plants. This is called the *vernation* (q.v.) of leaves, and is analogous to the *æstivation* (q.v.) of flowers. The buds of exogenous plants originate in cellular prolongations of the medullary rays bursting through the bark; those of endogenous plants are in communication with the cellular matter which lies between the bundles of woody tissue in the stem; and buds elongate into branches by the addition of new cellular matter to the extremity. Leaf-buds are capable of subsisting when separated from the parent plant and placed in favorable situations, developing themselves into new plants with the most exact correspondence in their characteristics to the parent plant; and of this gardeners avail themselves in the process of *budding* (q.v.), and in various ways for the propagation of plants. Some plants propagate themselves by a natural detachment of buds (*bulbils* or *bulblets*), modified into a character analogous to that of *bulbs* (q.v.); and bulbs themselves may indeed be regarded as subterranean leaf-buds with thickened scales. The *eyes* of the potato are also subterranean leaf-buds, the tuber being regarded as a thickened subterranean stem; and all plants with subterranean stems produce subterranean leaf-buds, sending above ground only herbaceous annual shoots, as asparagus, the banana, etc. Buds may be produced in exogenous plants from the extremity of any medullary ray, and may be made to spring from a leafless part of the stem by an incision, the effect of which is to direct a greater supply of sap to the part immediately beneath it. In a few plants, buds are produced on the edges, or even on the surface of leaves. In consequence of their power of independent existence, buds have been looked upon by some physiologists as distinct organized beings congregated in the tree or plant, a view which involves exaggeration, and therefore error.—Flower-buds cannot be used for budding, or otherwise for propagation of the plant, but when removed from their original stock, always die.

Some of the lowest animals propagate themselves by buds (*gemination*), and many of the zoophyte systems or polypidoms extend in this manner. See GEMMATION, REPRODUCTION, POLYPI, and ZOOPHYTES.

BUDA (Slavonic, *Bu'din*; German, *O'fen*), a city of Hungary, forming with Pesth (with which it is united by a magnificent suspension-bridge) the capital of the country, is situated on the right bank of the Danube about 130 m. s.e. of Vienna, in lat. 47° 29' n., and long. 19° 3' east. B. has a highly picturesque appearance, being built round the Schlossberg (Castle-hill) in the form of an amphitheater, in the midst of a district covered with vineyards. Crowning this center hill or rock, which has an elevation of 485 ft. above the sea, is the citadel; the palace in which are preserved the royal insignia of

Hungary; and an old Gothic church. Behind, and towering above the rock, rises the Blocksberg, strongly fortified, with a precipitous face to the Danube, the slopes of the other sides being occupied with houses. B. has many educational and charitable institutions; and a fine observatory crowns the Blocksberg. It has some celebrated hot sulphur springs, with a temperature of $117^{\circ} 5' F.$, from which it derives its German name, Ofen (Oven). Three of the baths erected by the Turks are still in a perfect state of preservation, and are much frequented by the common people. B. has some manufactures of silk, velvet, woolens, cotton, leather, and gunpowder, and cannon and type foundries; but its chief trade is in wine, of which it produces between four and five millions of gallons annually. This is known as the "Ofenerwein," and is of excellent quality. Pop. '69, 53,998. B. is a place of great antiquity, but its importance dates from 1240, when the fortress was erected on the Schlossberg. During the inroads of the Turks, it was regarded as the key of Christendom. It was captured by Solymán the magnificent in 1526, but retaken in the following year by Ferdinand I., king of Bohemia. In 1541, it was again taken by Solymán, who introduced into it a garrison of 12,000 janizaries; and it remained in possession of the Turks until 1686, when it was captured by the duke of Lorraine. B. and Pesth (q.v.) were in 1872 incorporated with one another, the official name being the compound *Budapest*.

BUDÆUS (the Latinized form of *Guillaume Bude*), one of the greatest French scholars of his age, was b. in Paris in 1467. He studied there and at Orleans. His works on philology, philosophy, and jurisprudence display extensive learning, but the two best known are the *De Assé et Partibus ejus* (Paris, 1514), which contains a very thorough investigation into ancient coins; and the *Commentarii Lingvæ Græcæ* (Paris, 1519), which greatly advanced the study of Greek literature in France, and is still held in high estimation by classical scholars. B.'s knowledge of Greek was particularly good. His style both in Latin and French is nervous, but harsh, and abounds in Greek constructions. His abilities were manifested not only in literature, but in public business. Louis XII. twice sent him to Rome as ambassador; and Francis I. also employed him in several negotiations. At B.'s suggestion, Francis founded the *Collège de France*, and was also persuaded to refrain from prohibiting printing, which the bigoted Sorbonne had advised in 1533. During his life, B. held several important offices. He was royal librarian, *maitre des requêtes*, and provost of Paris. He died 23d Aug., 1540. A collected edition of his works appeared at Basel in 1557. B. was suspected of a leaning towards Calvinism. Certain circumstances render this highly probable. In his correspondence with his friend Erasmus, he repeatedly expresses his contempt for monks and ignorant ecclesiastics, and on one occasion terms the doctors of the Sorbonne "prating sophists." Besides, what is perhaps even more conclusive, shortly after his death, his widow and several members of his family went to Geneva, and openly abjured Catholicism.

BUDAON', BUDAUN, or BUDAYOON, a t. of India, 140 m. n.w. of Lucknow, giving its name to a British district of the Rohilkund division of the Neutenant-governorship of the n.w. provinces. It is situated in $28^{\circ} 2' n.$ lat., and $79^{\circ} 11' e.$ long. Its pop. was officially ascertained in 1872 to amount to 33,322. It was occupied by the mutineers and a body of liberated prisoners from Bareilly, June 1, 1857. The Europeans escaped by flight. It was captured by gen. Whitelock, April 19, 1858, and the rebels in this quarter were soon afterwards entirely subdued.—The district of Budaon contains an area of 2065 sq.m., and a pop. (1872) of 934,348, of which nearly six sevenths are Hindus, and the remainder mostly Mussulmans. The district is a level, fertile tract on the Ganges and tributaries of it, of which the chief is the Ramgunga.

BUDÆUS, JOHANN FRANZ, 1667–1729; a learned Lutheran divine, b. in Pomerania. At Wittenberg he won distinction in languages, theology, and history; was Greek and Latin professor at Coburg, professor of ethical sciences and politics in the university of Halle, and in 1705 professor of divinity at Jena. He produced an historical German dictionary, an ecclesiastical history of the Old Testament, a work on practical philosophy, one on laws, and a universal theological history.

BUD DHISM—BUD DHA. The religion known as Buddhism (from the title of "The Buddha," meaning "the wise," "the enlightened," acquired by its founder) has existed now for 2460 years, and may be said to be the prevailing religion of the world. In Hindustan, the land of its birth, it has now little hold, except among the Nepaulese and some other northern tribes; but it bears full sway in Ceylon, and over the whole eastern peninsula; it divides the adherence of the Chinese with the systems of Confucius and Lao-tse, claiming perhaps two thirds of the population; it prevails also in Japan (although not the established religion); and, n. of the Himalayas, it is the religion of Thibet (where it assumes the form of Lamaism), and of the Mongolian population of central Asia, and extends to the very n. of Siberia, and even into Swedish Lapland. Its adherents are estimated at 400 millions—more than a third of the human race. Yet, till near the middle of this century, nothing was known in Europe respecting the nature and origin of this world-religion, beyond the vaguest notices and conjectures. About the year 1828, Mr. B. H. Hodgson, British resident at the court of Nepal, where Buddhism prevails, discovered the existence of a large set of writings in the Sanscrit language, forming the national canonical books. These books have since been found to be the

texts from which the Buddhist Scriptures of Thibet, Mongolia, and China must have been translated. The books of the Ceylon Buddhists are in the language called Pali; and though not translations of the Nepaulese standards, they are found to agree with them in substance, and to be only another and somewhat later version of the same traditions. Translations from the Ceylon standards are used by the Buddhists of Burmah and Siam. Copies of the Sanscrit books of Nepal, having been sent by Mr. Hodgson to the Asiatic societies of London and Paris, engaged the attention of the eminent oriental scholar, Eugène Burnouf, who published in 1844 his *Introduction to the History of Buddhism*; and this book may be said to have been the beginning of anything like correct information on the subject among the western nations.

The most diverse opinions had previously prevailed as to the time and place of the origin of Buddhism. Some looked upon it as a relic of what had been the original religion of Hindustan, before Brahmanism intruded and drove it out; a relic of a widespread primeval worship, whose ramifications it was endeavored to trace by identifying Buddha with the Woden of the Scandinavians, the Thoth or Hermes of the ancient Egyptians, and other mythological personages. Others held that it could not be older than Christianity, and must have originated in a blundering attempt to copy that religion—so striking are the many points of resemblance that present themselves. Although the means are still wanting of giving a circumstantial history of Buddhism, the main outline is no longer doubtful. Oriental scholars now concur in fixing the date of its origin about the beginning of the 6th c. B. C., and in making it spring up in the N. of Hindustan. According to the Buddhist books, the founder of the religion was a prince of the name of Siddhartha, son of Suddhodana, king of Kapilavastu, which is placed somewhere on the confines of Oude and Nepal. He is often called Sakya, which was the name of the family, and also Gautama, the name of the great "Solar" race of which the family was a branch. The name Sakya often becomes Sakya-muni (*muni*, in San., means "solitary," and is allied to Gr. *monos*, the root of "monk"), i. e. allusion to the solitary habits assumed by the prince. To Gautama is frequently prefixed *Sramana*, meaning *ascetic*. Of the names, or rather titles, given to Siddhartha in his state of perfection, the most important is the *Buddha*,* which is from the root *budh*, to know, and, according to Wilson, means properly, "he to whom truth is known:" it is indicative of the leading doctrine of his system. Others are "The blessed" (Bhagavat); "the venerable of the world;" "the Bodhisatva," the import of which will be afterwards explained. The history of this person is overlaid with a mass of extravagant and incredible legend; and at least one eminent orientalist, prof. H. H. Wilson, thinks it still doubtful whether the Buddha was an actual historical personage, and not rather an allegorical figment. Agreeing that the doctrine was introduced about the time assigned, he thinks it more likely that it originated with a school formed of persons of various castes, comprising even Brahmans. But by oriental authorities generally, the Buddha is received as the actual personal founder of the religion that goes by his name.

Assuming that the Buddha was a real person, and that there is a basis of fact under the mass of extravagant fable with which he is surrounded, the history of Buddhism may be thus briefly outlined: The prince Siddhartha gives early indications of a contemplative, ascetic disposition; and his father, fearing lest he should desert his high station as Kshatriya (see HINDUISM and CASTE) and ruler, and take to a religious life, has him early married to a charming princess, and surrounded with all the splendor and dissipation of a luxurious court. Twelve years spent in this environment only deepen the conviction, that all that life can offer is vanity and vexation of spirit. He is constantly brooding over the thought that old age, withered and joyless, is fast approaching; that loathsome or racking sickness may at any moment seize him; that death will at all events soon cut off all present sources of enjoyment, and usher in a new cycle of unknown trials and sufferings. These images hang like Damocles' sword over every proposed feast of pleasure, and make enjoyment impossible. He therefore resolves to try whether a life of austerity will not lead to peace; and, although his father seeks to detain him by setting guards on every outlet of the palace, he escapes, and begins the life of a religious mendicant, being now about 30 years old. To mark his breaking off all secular ties, he cuts off the long locks that were a sign of his high caste; and as the shortened hair turned upwards, he is always represented in figures with curly hair, which induced early European writers to consider him as of Ethiopian origin. He commences by studying all that the Brahmans can teach him, but finds their doctrine unsatisfactory. Six years of rigorous asceticism are equally vain; and resolving to return to a more genial life, he is deserted by his five disciples, and then undergoes a fierce temptation from the demon of wickedness. But no discouragement or opposition can divert Sakya-muni from the search after deliverance. He will conquer the secret by sheer force of thinking. He sits for weeks plunged in abstraction, revolving the causes

* There is a confusing variety in the modes in which this name is spelled by European writers. S. Hardy, in his *Manual of Buddhism*, gives more than fifty forms that have come under his notice. Some of the more common are Bud, Bod, Buth, Budh, Boodh, Bhood, Budo, Buddow, Boutta, Poota, Poth, Pot. The Chinese, owing to the meagerness of their articulations, seem to have been unable to come nearer to the real sound than Fo, Foe, or Fohi: from the same cause, they convert Brahma into Fan.

of things. If we were not born, he reflects, we should not be subject to old age, misery, and death; therefore, the cause of these evils is birth. But whence comes birth or continued existence? Through a long concatenation of intermediate causes, he arrives at the conclusion that ignorance is the ultimate cause of existence; and therefore, with the removal of ignorance, existence and all its anxieties and miseries would be cut off at their source. Passing through successive stages of contemplation, he realizes this, in his own person, and attains the perfect wisdom of the Buddha. The scene of this final triumph received the name of Bodhimanda (the seat of intelligence), and the tree under which he sat was called Bodhidruma (the tree of intelligence), whence bo-tree. The Buddhists believe the spot to be the center of the earth. Twelve hundred years after the Buddha's death, Hiouen-Tsang, the Chinese pilgrim, found the Bodhidruma—or a tree that passed for it—still standing. Although the religion of Buddha is extinct in the neighborhood, there are, about 5 m. from Gaya Proper, in Bahar, extensive ruins and an old dagoba, or a temple, which are believed to mark the place. Near the temple there flourished, in 1812, a peepul-tree, apparently 100 years old, which may have been planted in the place of the original bo-tree.

Having arrived at the knowledge of the causes of misery, and of the means by which these causes are to be counteracted, the Buddha was now ready to lead others on the road to salvation. It was at Benares that he first preached, or, in the consecrated phrase, "turned the wheel of the law;"* but the most important of his early converts was Bimbisara, the sovereign of Magadha (Bahar), whose dynasty continued for many centuries to patronize the new faith. During the forty years that he continued to preach his strange gospel, he appears to have traversed a great part of northern India, combating the Brahmans, and everywhere making numerous converts. He died at Kusinagara (in Oude), at the age of 80, in the year 543 B.C.; and his body being burned, the relics were distributed among a number of contending claimants; and monumental tumuli were erected to preserve them. See TOPES.

The most important point in the history of Buddhism, after the death of its founder, is that of the three councils which fixed the canon of the sacred scriptures and the discipline of the church. The Buddha had written nothing himself; but his chief followers, assembled in council immediately after his death, proceeded to reduce his teaching to writing. These canonical writings are divided into three classes, forming the tripitaka or "triple basket." The first class consist of the *soutras*, or discourses of the Buddha; the second contains the *vinaya*, or discipline; and the third the *abhidharma*, or metaphysic. The first is evidently the fundamental text out of which all the subsequent writings have been elaborated. The other two councils probably revised and expanded the writings agreed upon at the first, adding voluminous commentaries; as to the dates of the other two councils, there are irreconcilable discrepancies in the accounts; but at all events the third was not later than 240 B.C., so that the Buddhist canonical scriptures, as they now exist, were fixed two centuries and a half before the Christian era. The Buddhist religion early manifested a zealous missionary spirit; and princes and even princesses became devoted propagandists. A prince of the royal house of Magadha, Mahindo, carried the faith to Ceylon, 307 B.C. The Chinese annals speak of a Buddhist missionary as early as 217 B.C.; and the doctrine made such progress, that in 65 A.D. it was acknowledged by the Chinese emperor as a third state religion. The Chinese Buddhists have always looked on India as their "holy land;" and, beginning with the 4th c. of our era, a stream of Buddhist pilgrims continued to flow from China to India during six centuries. Several of these pilgrims have left accounts of their travels, which throw a light on the course of Buddhism in India, and on the internal state of the country in general, that is looked for in vain in the literature of India itself. See HIOUEN-TSANG. As to the spread of Buddhism n. of the Himalayan mountains, we have the historical fact, that a Chinese general, having about the year 120 B.C. defeated the barbarous tribes to the n. of the desert of Gobi, brought back as a trophy a golden statue of the Buddha.

A prominent name in the history of Buddhism is that of Asoka, king of Magadha, in the 3d c. of our era, whose sway seems to have extended over the whole peninsula of Hindustan, and even over Ceylon. This prince was to Buddhism what Constantine was to Christianity. He was at first a persecutor of the faith, but being converted—by a miracle, according to the legend—he became its zealous propagator. Not, however, as princes usually promote their creed; for it is a distinguishing characteristic of Buddhism, that it has never employed force, hardly even to resist aggression. Asoka showed his zeal by building and endowing viharas or monasteries, and raising topes and other monuments over the relics of Buddha and in spots remarkable as the scenes of his labors. Hiouen-Tsang, in the 7th c. of our era, found topes attributed to Asoka from the foot of the Hindu Kush to the extremity of the peninsula. There exist, also, in different parts of India, edicts inscribed on rocks and pillars inculcating the doctrines of Buddha. The edicts are in the name of king Piyadasi; but orientalists are almost unanimous in hold-

* From a too literal understanding of this phrase have arisen, probably, those praying-wheels, or rather wheels for meditation, seen standing before Buddhist monasteries in Tibet and elsewhere. The doctrines of Buddha are inscribed on the wheel, which is then set in motion by a windlass, or even by horse-power. The individual monks have portable ones, with which they perform their devotions, wherever they may happen to be.

ing Piyadasi and Asoka to be one and the same. Not a single building or sculptured stone has been discovered in continental India of earlier date than the reign of this monarch, whose death is assigned to 226 B.C. A remarkable spirit of charity and toleration runs through these royal sermons. The "king beloved of the gods" desires to see the ascetics of all creeds living in all places, for they all teach the essential rules of conduct. "A man ought to honor his own faith only; but he should never abuse the faith of others. . . . There are even circumstances where the religion of others ought to be honored, and in acting thus, a man fortifies his own faith, and assists the faith of others."

For the glimpses we get of the state of Buddhism in India, we are indebted chiefly to the accounts of Chinese pilgrims. Fa-hian, at the end of the 4th c., found some appearances of decline in the e. of Hindustan, its birthplace, but it was still strong in the Punjab and the north. In Ceylon, it was flourishing in full vigor, the ascetics or monks numbering from 50,000 to 60,000. In the 7th c.—that is, 1200 years after the death of the Buddha—Hiouen-Tsang represents it as widely dominant and flourishing, and patronized by powerful rajahs. Its history was doubtless more or less checkered. The Brahmans, though little less tolerant than the followers of Buddha, seem to have been in some cases roused into active opposition; and some princes employed persecution to put down the new faith.

It was probably during the first four or five centuries of our era, and as a result of persecution, that Buddhists, driven from the great cities, retired among the hills of the west, and there constructed those cave-temples which, for their number, vastness, and elaborate structure, continue to excite the wonder of all who see them. There are reckoned to be not fewer than 900 Buddhist excavations still extant in India, nearly all within the presidency of Bombay. How the destruction of the Buddhist faith in Hindustan came about—whether from internal corruption, or the persecution of powerful princes, adherents of the old faith—we are utterly in the dark. But it is certain that from the time of Hiouen-Tsang's visit, its decay must have been rapid beyond precedent; for about the 11th or 12th c., the last traces of it disappear from the Indian peninsula.

What, then, is the nature of this faith, which has been for so long, and is still, the sole light of so many millions of human beings? In answering this question, we must confine ourselves here to a brief outline of the intellectual theory on which the system is based, and of the general character of its morality and ritual observances, as they were conceived by the founder and his more immediate followers; referring for the various forms which the external observances have assumed to the several countries where it is believed and practiced. See BURMAH, CEYLON, CHINA, JAPAN, LAMAISM.

Buddhism is based on the same views of human existence, and the same philosophy of things in general, that prevailed among the Brahmans. It accepts without questioning, and in its most exaggerated form, the doctrine of the transmigration of souls, which lies at the root of so much that is strange in the eastern character. For a particular account of this important doctrine or notion, which seems ingrained in the constitution of eastern minds, and without a knowledge of which no phase of thought or feeling among them can be understood, the reader is referred to TRANSMIGRATION; while the peculiar cosmogony or system of the universe with which it is associated, and which is substantially the same among Hindus and Buddhists, will be described under HINDUISM. It is sufficient here to say, that, according to Buddhist belief, when a man dies, he is immediately born again, or appears in a new shape; and that shape may, according to his merit or demerit, be any of the innumerable orders of being composing the Buddhist universe—from a clod to a divinity. If his demerit would not be sufficiently punished by a degraded earthly existence—in the form, for instance, of a woman or a slave, of a persecuted or a disgusting animal, of a plant, or even of a piece of inorganic matter—he will be born in some one of the 136 Buddhist hells, situated in the interior of the earth. These places of punishment have a regular gradation in the intensity of the suffering and in the length of time the sufferers live, the least term of life being 10 millions of years, the longer terms being almost beyond the powers of even Indian notation to express. A meritorious life, on the other hand, secures the next birth either in an exalted and happy position on earth, or as a blessed spirit, or even divinity, in one of the many heavens; in which the least duration of life is about 10 billions of years. But however long the life, whether of misery or of bliss, it has an end, and at its close the individual must be born again, and may again be either happy or miserable—either a god or, it may be, the vilest inanimate object.* The Buddha himself, before his last birth as Sakyamuni, had gone through every conceivable form of existence on the earth, in the air, and in the water, in hell and in heaven, and had filled every condition in human life. When he attained the perfect knowledge of the Buddha, he was able to recall all these existences; and a great part of the Buddhist legendary literature is taken up in narrating his exploits when he lived as an elephant, as a bird, as a stag, and so forth.

The Buddhist conception of the way in which the quality of actions—which is expressed in Pali by the word *karma*, including both merit and demerit—determines

* One legend makes Bhagavat, in order to impress upon the monks of a monastery the importance of their duties, point to a besom, and, by his supernatural insight, reveal to them that it had once been a novice, who had been negligent in sweeping the hall of assembly; the walls and pillars, again, he told them, had once existed as monks, who soiled the walls of the hall by spitting upon them.

the future condition of all sentient beings, is peculiar. They do not conceive any god or gods as being pleased or displeased by the actions, and as assigning the actors their future condition by way of punishment or of reward. The very idea of a god, as creating or in any way ruling the world, is utterly absent in the Buddhist system. God is not so much as denied; he is simply not known. Contrary to the opinion once confidently and generally held, that a nation of atheists never existed, it is no longer to be disputed that the numerous Buddhist nations are essentially atheist; for they know no beings with greater supernatural power than any man is supposed capable of attaining to by virtue, austerity, and science; and a remarkable indication of this startling fact is to be seen in the circumstance that some at least of the Buddhist nations—the Chinese, Mongols, and Tibetans—have no word in their languages to express the notion of God. The future condition of the Buddhist, then, is not assigned him by the Ruler of the universe; the "karma" of his actions determines it by a sort of virtue inherent in the nature of things—by the blind and unconscious concatenation of cause and effect. But the laws by which consequences are regulated seem dark, and even capricious. A bad action may lie dormant, as it were, for many existences; the taint, however, is there, and will some time or other break out. A Buddhist is thus never at a loss to account for any calamity that may befall himself or others.

Another basis of Buddhism is the assumption that human existence is on the whole miserable, and a curse rather than a blessing. This notion, or rather feeling, is, like transmigration, common to Buddhism and Brahmanism, and is even more prominent in Buddhism than in the old faith. It is difficult for a European to conceive this state of mind, or to believe that it can be habitual in a whole people; and many signal errors in dealing with the Indian nations have arisen from overlooking the fact. The cause would seem to lie chiefly in the comparatively feeble physical organization of easterns in general. With a vigorous animal vitality, there is a massive enjoyment in mere bodily existence sufficient to drown a large amount of irritation and suffering, leaving life still sweet and desirable; while the spontaneous activity attending this vigor, makes it a pleasure instead of a pain to contend with and conquer difficulties. The Indian, on the contrary, even when he looks robust, has little intensity of animal vitality; and therefore, bodily existence, in itself, has to him little relish. Tedium of life, it is well known, arises more from negative than positive sources; and it requires but little bitter added to make his cup disgusting. So far, again, from finding activity a source of enjoyment, exertion is painful, and entire quiescence is, in his eyes, the highest state of conceivable enjoyment. When to this we add that want of security and peace, and that habitual oppression of the many by the few, with all the attendant degradation and positive suffering, which may be considered the normal state of things in the east, need we wonder that to men so constituted and so circumstanced, life should seem a burden, a thing rather to be feared than otherwise? The little value that Hindus set upon their lives is manifested in many ways. The punishment of death, again, has little or no terror for them, and is even sometimes coveted as an honor. For, in addition to the little value of their present existence, they have the most undoubting assurance that their soul, if dislodged from its present tenement, will forthwith find another, with a chance, at least, of its being a better one.

In the eyes, then, of Sakyamuni and his followers, sentient existence was hopelessly miserable. Misery was not a mere taint in it, the removal of which would make it happy; misery was its very essence. Death was no escape from this inevitable lot; for, according to the doctrine of transmigration, death was only a passage into some other form of existence equally doomed. Even the heaven and the state of godhead which form part of the cycle of changes in this system, were not final; and this thought poisoned what happiness they might be capable of yielding. Brahman philosophers had sought escape from this endless cycle of unsatisfying changes, by making the individual soul be absorbed in the universal spirit (Brahm); Gautama had the same object in view—viz., exemption from being born again; but he had not the same means of reaching it. His philosophy was utterly atheistic, like that of the original Sankhya school of philosophy, whose views he chiefly borrowed, and ignored a supreme God or Creator; it did not leave even an impersonal spirit of the universe into which the human soul could be absorbed. Gautama sees no escape but in what he calls NIRVANA, the exact nature of which has been matter of dispute. According to its etymology, the word means "extinction," "blowing out," as of a candle; and most orientlists are agreed that in the Buddhist scriptures generally it is equivalent to annihilation. Even in those schools which attempt to draw a distinction, the distinction is of the most evanescent kind. See NIRVANA.

The key of the whole scheme of Buddhist salvation lies in what Gautama called his four sublime verities. The first asserts that pain exists; the second, that the cause of pain is desire or attachment—the meaning of which will appear further on; the third, that pain can be ended by Nirvana; and the fourth shows the way that leads to Nirvana. This way to Nirvana consists in eight things: right faith, right judgment, right language, right purpose, right practice, right obedience, right memory, and right meditation. In order to understand how this method is to lead to the proposed end, we must turn to the metaphysical part of the system contained in the "concatenation of causes," which may be looked upon as a development of the second "verity"—namely, that the cause of

pain is desire—or rather, as the analysis upon which that verity is founded. The immediate cause of pain is birth, for if we were not born, we should not be exposed to death or any of the ills of life. Birth, again, is caused by previous existence; it is only a transition from one state of existence into another. All the actions and affections of a being throughout his migrations leave their impressions, stains, attachments adhering to him, and the accumulation of these determines at each stage the peculiar modification of existence he must next assume. But for these adhesions, the soul would be free; not being bound down to migrate into any determinate condition of life, it would follow that it need not migrate at all. These adhesions or attachments, good and bad, depend upon desire, or rather, upon affection of any kind in the soul towards the objects; as if only what moved the soul to desire or avoidance could leave its impress upon it. We thus arrive at desire—including both the desire to possess, and the desire to avoid—as one link in the chain of causes of continued existence and pain. Beyond this the dependence of the links is very difficult to trace; for desire is said to be caused by perception, perception by contact, and so on, until we come to ideas. Ideas, however, are mere illusions, the results of ignorance or error, attributing durability and reality to that which is transitory and imaginary. Cut off this ignorance, bring the mind into a state in which it can see and feel the illusory nature of things, and forthwith the whole train vanishes; illusory ideas, distinction of forms, senses, contact, perception, desire, attachment, existence, birth, misery, old age, death!

Morality and Religious Observances.—The eight parts or particulars constituting the theoretical “way” (to Nirvana), was developed by Gautama into a set of practical precepts enjoining the various duties of common life and of religion. They are all ostensibly intended as means of counteracting or destroying the chain of causes that tie men to existence and necessitate being born again, especially that most important link in the chain constituted by the attachments or desires resulting from former actions; although the special fitness of some of the precepts for that end is far from being apparent. It is easy to understand how the austerities that are prescribed might subdue the passions and affections, and lessen the attachment to existence; but how the exercise of benevolence, of meekness, of regard to truth, of respect to parents, etc., on which Gautama laid so much stress, should have this effect, it is difficult to conceive. Luckily for the Buddhist world, Gautama’s moral nature was better than his logic, or rather than the perverse assumptions from which his logic starts; and as he felt strongly—what all men have felt more or less—that these things are essentially right and good, he takes it for granted that they must contribute to what was in his eyes the chief good—escape from existence, or Nirvana. In delivering his precepts, the Buddha considers men as divided into two classes—those who have embraced the religious life (*Sramanas*), and those who continue in the world, or are laymen. These last are considered as too much attached to existence to feel any desire or have any hope of emancipation, at least at this stage. But there are certain precepts which it is necessary for all to obey, that they may not bring greater misery upon themselves in their next births, and rivet the bonds of existence more indissolubly. There are ten moral precepts or “precepts of aversion.” Five of these are of universal obligation—viz., not to kill; not to steal; not to commit adultery; not to lie; not to be drunken. Other five are for those entering on the direct pursuit of Nirvana by embracing the religious life: to abstain from food out of season—that is, after midday; to abstain from dances, theatrical representations, songs, and music; to abstain from personal ornaments and perfumes; to abstain from a lofty and luxurious couch; to abstain from taking gold and silver. For the regular ascetics or monks, there are a number of special observances of a very severe kind. They are to dress only in rags, sewed together with their own hands, and to have a yellow cloak thrown over the rags. They are to eat only the simplest food, and to possess nothing except what they get by collecting alms from door to door in their wooden bowl. They are allowed only one meal, and that must be eaten before midday. For a part of the year, they are to live in forests, with no other shelter except the shadow of a tree, and there they must sit on their carpet even during sleep, to lie down being forbidden. They are allowed to enter the nearest village or town to beg food, but they must return to their forests before night.

Besides the absolutely necessary “aversions and observances” above mentioned, the transgression of which must lead to misery in the next existence, there are certain virtues or “perfections” of a supererogatory or transcendent kind, that tend directly to “conduct to the other shore” (Nirvana). The most essential of these are almsgiving or charity, purity, patience, courage, contemplation, and knowledge. Charity or benevolence may be said to be the characteristic virtue of Buddhism—a charity boundless in its self-abnegation, and extending to every sentient being. The benevolent actions done by the Buddha himself, in the course of his many millions of migrations, were favorite themes of his followers. On one occasion, seeing a tigress starved and unable to feed her cubs, he hesitated not to make his body an oblation to charity, and allowed them to devour him. Benevolence to animals, with that tendency to exaggerate a right principle so characteristic of the east, is carried among the Buddhist monks to the length of avoiding the destruction of fleas and the most noxious vermin, which they remove from their persons with all tenderness.

There are other virtues of a secondary kind, though still highly commendable. Thus,

not content with forbidding lying, the Buddha strictly enjoins the avoidance of all offensive and gross language, and of saying or repeating anything that can set others at enmity among themselves; it is a duty, on the contrary, especially for a sramana, to act on all occasions as a peacemaker. Patience under injury, and resignation in misfortune, are strongly inculcated. Humility, again, holds a no less prominent place amongst Buddhist graces than it does among the Christian. The Buddhist saints are to conceal their good works, and display their faults. As the outward expression of this sentiment of humility, Gautama instituted the practice of confession. Twice a month, at the new and at the full moon, the monks confessed their faults aloud before the assembly. This humiliation and repentance seems the only means of expiating sin that was known to Gautama. Confession was exacted of all believers, only not so frequently as of the monks. The edicts of Piyadasi recommend a general and public confession at least once in five years. The practice of public confession would seem to have died out by the time of Hiouen-Tsang's visit to India.

Such are the leading features of the moral code of the Buddha, of which it has been said, that "for pureness, excellence, and wisdom, it is only second to that of the Divine Lawgiver himself." But the original morality of Buddhism has, in the course of time, been disfigured by many subtilities, puerilities, and extravagances, derived from the casuistry of the various schools of later times; just as the casuistry of the Jesuits, for instance, perverted many of the precepts of Christianity. The theory on which the Buddha founds his whole system gives, it must be confessed, only too much scope to such perversions; for, on that theory, truth is to be spoken, self to be sacrificed, benevolence to be exercised, not for the sake of the good thus done to others, but solely for the effect of this conduct on the soul of the actor, in preparing him for escape from existence. To teach men "the means of arriving at the other shore," was another expression for teaching virtue; and that other shore was annihilation. On this principle, the Buddhist casuist can, like the Jewish, render of none effect the universal law of charity and the duty of respecting and aiding parents, on which the Buddha laid such stress. Thus, a Bikshu—that is, one who has engaged to lead a life of self-denial, celibacy, and mendicancy, and is thus on the high-road to Nirvana—is forbidden to look at or converse with a female, lest any disturbing emotion should ruffle the serene indifference of his soul; and so important is this, that "if his mother have fallen into a river, and be drowning, he shall not give her his hand to help her out; if there be a pole at hand, he may reach that to her; but if not, she must drown."—*Wilson*.

Contemplation and science or knowledge (i. e., of the concatenation of causes and effects) are ranked as virtues in Buddhism, and hold a prominent place among the means of attaining Nirvana. It is reserved, in fact, for abstract contemplation to effect the final steps of the deliverance. Thought is the highest faculty of man, and, in the mind of an eastern philosopher, the mightiest of all forces. A king who had become a convert to Buddhism is represented as seating himself with his legs crossed, and his mind collected; and "cleaving, with the thunderbolt of science, the mountain of ignorance," he saw before him the desired state. It is in this cross-legged, contemplative position that the Buddha is almost always represented—that crowning intellectual act of his, when, seated under the Bo-tree (q v.), he attained the full knowledge of the Buddha, saw the illusory nature of all things, broke the last bonds that tied him to existence, and stood delivered for evermore from the necessity of being born again, being considered the culmination of his character, and the highest object of imitation to all his followers.

"Complete" Nirvana or extinction cannot, of course, take place till death; but this state of preparation for it, called simply Nirvana, seems attainable during life, and was, in fact, attained by Gautama himself. The process by which the state is attained is called *Dhyana*, and is neither more nor less than ecstasy or trance, which plays so important a part among mystics of all religions. The individual is described as losing one feeling after another, until perfect apathy is attained, and he reaches a region "where there are neither ideas, nor the idea of the absence of ideas!"

The *ritual* or *worship* of Buddhism—if worship it can be called—is very simple in its character. There are no priests, or clergy, properly so called. The *Sramanas* or *Bikshus* (mendicants) are simply a religious order—a kind of monks, who, in order to the more speedy attainment of Nirvana, have entered on a course of greater sanctity and austerity than ordinary men; they have no sacraments to administer or rites to perform for the people, for every Buddhist is his own priest. The only thing like a clerical function they discharge, is to read the scriptures or discourses of the Buddha in stated assemblies of the people held for that purpose. They have also everywhere, except in China, a monopoly of education; and thus in Buddhist countries education, whatever may be its quality, is very generally diffused. In some countries, the monks are exceedingly numerous, around Lhassa in Thibet, for instance, they are said to be one third of the population. They live in *viharas* or monasteries, and subsist partly by endowments, but mostly by charity. Except in Tibet, they are not allowed to engage in any secular occupation. The vow is not irrevocable. This incubus of monachism constitutes the great weakness of Buddhism in its social aspect. Further particulars regarding Buddhist monks and monasteries, as well as the forms of Buddhist worship generally, will be given when speaking of the countries where the religion prevails. See LAMAISM.

The adoration of the statues of the Buddha and of his relics is the chief external ceremony of the religion. This, with prayer and the repetition of sacred formulas, constitutes the ritual. The centers of the worship are the temples containing statues, and the topes or tumuli erected over the relics of the Buddha, or of his distinguished apostles, or on spots consecrated as the scenes of the Buddha's acts. The central object in a Buddhist temple, corresponding to the altar in a Roman Catholic church, is an image of the Buddha, or a dagoba or shrine containing his relics. Here flowers,* fruit, and incense are daily offered, and processions are made with singing of hymns. Of the relics of the Buddha, the most famous are the *teeth* that are preserved with intense veneration in various places. Hiouen-Tsang saw more than a dozen of them in different parts of India; and the great monarch Ciladitya was on the eve of making war on the king of Cashmere for the possession of one, which, although by no means the largest, was yet an inch and a half long. The tooth of the Buddha preserved in Ceylon, a piece of ivory about the size of the little-finger, is exhibited very rarely, and then only with permission of the English government—so great is the concourse and so intense the excitement. See CEYLON.

There appears at first sight to be an inconsistency between this seeming worship of the Buddha and the theory by which he is considered as no longer existing. Yet the two things are really not irreconcilable; not more so, at least, than theory and practice often are. With all their admiration of the Buddha, his followers have never made a god of him. Gautama is only the last Buddha—the Buddha of the present cycle. He had predecessors in the cycles that are past (24 Buddhas of the past are enumerated, and Gautama could even tell their names); and when, at the end of the present cycle, all things shall be reduced to their elements, and the knowledge of the way of salvation shall perish with all things else, then, in the new world that shall spring up, another Buddha will appear, again to reveal to the renascent beings the way to Nirvana. Gautama foretold that Mitraya, one of his earliest adherents, should be the next Buddha † (the Buddha of the future), and he gratified several of his followers with a like prospect in after-cycles. The Buddha was thus no greater than any mortal may aspire to become. The prodigious and supernatural powers which the legends represent him as possessing, are quite in accordance with Indian ideas; for even the Brahmans believe that by virtue, austerities, and science a man may acquire power to make the gods tremble on their thrones.

The Buddha, then, is not a god; he is the ideal of what any man may become; and the great object of Buddhist worship is to keep this ideal vividly in the minds of the believers. In the presence of the statue, the tooth, or the footprint, the devout believer vividly recalls the example of him who trod the path that leads to deliverance. This veneration of the memory of Buddha is perhaps hardly distinguishable, among the ignorant, from worship of him as a present god; but in theory, the ritual is strictly commemorative, and does not necessarily involve idolatry, any more than the garlands laid on the tomb of a parent by a pious child. See TOPE.

The prayers addressed to the Buddha are more difficult to reconcile with the belief in his having ceased to exist. It is improbable, indeed, that the original scheme of Buddhism contemplated either the adoration of the statues of the Buddha, or the offering of prayers to him after his death. These are an after-growth—accretions upon the simple scheme of Gautama, and in a manner forced upon it during its struggle with other religions. For, a system of belief that seeks to supplant other systems, finds itself enticed to present something to rival and outdo them, if possible, in every point. Even the Christian church, in the middle ages, adopted with this view many of the rites and legends of paganism that were quite inconsistent with its own character; merely casting over them a slight disguise, and giving them Christian names. Prayer, too, is natural to man—an irrepressible instinct, as it were, and had to be gratified. And then the inconsistency in uttering prayers when there is no one to hear or answer, glaring as it appears to us, is by no means great to the eastern mind. Prayers, like other formulas, are conceived less as influencing the will of any superior being to grant the request, than as working in some magical way—producing their effects by a blind force inherent in themselves. They are, in short, mere incantations or charms. Even the prayers of a Brahman, who believes in the existence of gods, do not act so much by inclining the deity addressed to favor the petitioner, as by compelling him through their mysterious potency—through the operation of a law above the will of the highest gods. The Buddhist, then, may well believe that a formula of prayer in the name of "the venerable of the world" will be potent for his good in this way, without troubling himself to think whether any conscious being hears it or not.

The element in Buddhism which more than any other, perhaps, gave it an advantage over all surrounding religions, and led to its surprising extension, was the spirit of universal charity and sympathy that it breathed, as contrasted with the exclusiveness of

*The quantity of flowers used as offerings is prodigious. A royal devotee in Ceylon, in the 15th c., offered on one occasion 6,480,320 flowers at the shrine of the tooth. At one temple it was provided that there should be offered "every day 100,000 flowers, and each day a different flower."

† One who is on the way to become a supreme Buddha, and has arrived at that stage when he has only one more birth to undergo, is styled a *Bodhisatva* (having the essence of knowledge: a mere candidate for Nirvana is an *arhat* (venerable).

caste. In this respect, it held much the same relation to Brahmanism that Christianity did to Judaism. It was, in fact, a reaction against the exclusiveness and formalism of Brahmanism—an attempt to render it more catholic, and to throw off its intolerable burden of ceremonies. Buddhism did not expressly abolish caste, but only declared that all followers of the Buddha who embraced the religious life were thereby released from its restrictions; in the bosom of a community who had all equally renounced the world, high and low, the twice-born Brahman and the outcast were brethren. This was the very way that Christianity dealt with the slavery of the ancient world. This opening of its ranks to all classes and to both sexes—for women were admitted to equal hopes and privileges with men, and one of Gautama's early female disciples is to be the supreme Buddha of a future cycle—no doubt gave Buddhism one great advantage over Brahmanism. The Buddha, says M. Müller, “addressed himself to castes and outcasts. He promised salvation to all; and he commanded his disciples to preach his doctrine in all places and to all men. A sense of duty, extending from the narrow limits of the house, the village, and the country, to the widest circle of mankind, a feeling of sympathy and brotherhood towards all men, the idea, in fact, of humanity, were first pronounced by Buddha.” This led to that remarkable missionary movement, already adverted to, which, beginning 300 B.C., sent forth a succession of devoted men, who spent their lives in spreading the faith of Buddha over all parts of Asia.

In the characteristic above mentioned, and in many other respects, the reader cannot fail to remark the striking resemblance that Buddhism presents to Christianity, and this in spite of the perverse theory on which it is founded. So numerous and surprising are the analogies and coincidences, that Mrs. Speir, in her book on *Life in Ancient India*, “could almost imagine that before God planted Christianity upon earth, he took a branch from the luxuriant tree, and threw it down to India.”

It would be superfluous to attempt here any formal refutation of the religion of the Buddha. To the readers of this work, the fundamental errors of the theory will be apparent enough. By giving prominence to the extravagances and almost inconceivable puerilities and absurdities with which the system has been overloaded, it would have been easy to make it look sufficiently ridiculous. But this is not to depict, it is to caricature. It is only too common for Christian writers to treat of heathen religions in such fashion. The only fair—the only true account of any religion, is that which enables the reader to conceive how human beings may have come to believe it and live by it. It is this object that has been chiefly kept in view in the preceding meager sketch of a vast subject. Those who wish to pursue it further are referred to Spence Hardy's *Manual of Buddhism*, and his *Eastern Monachism*, consisting chiefly of translations from the sacred books used in Ceylon; to J. Barthelemy Saint-Hilaire, *Le Bouddha et sa Religion*; and especially to a complete and elaborate digest by C. F. Koeppen of Berlin, in two vols.—*Religion of the Buddha*, and *Lamaist Hierarchy of Thibet*.

BUDDING, sometimes called **INOCULATION**, is an operation analogous to Grafting (q. v.), or indeed may be regarded as merely a particular mode of grafting, in which a leaf-bud is used as a graft instead of a young shoot. It is generally preferred for trees which are apt to throw out much gum when wounded, as the plum, cherry, peach, apricot, and stone-fruits in general, also for roses and many other flowering shrubs. The time for it is when the bud is perfectly formed, about or a little after midsummer. The bud to be employed is taken, by means of a sharp knife, from the branch on which it has grown—generally a branch of the former year—a small portion of the bark and young wood being taken with it, extending to about half an inch above and three quarters of an inch below the bud. The woody part is then separated from the bark and bud; but care is to be taken that the bud itself is not injured, which, however, is always the case when the operation is attempted before the bud is sufficiently matured, and is indicated by a hollow left at the bud when the wood has been removed. A longitudinal and a transverse cut are made in the bark of the stock intended to receive the bud, in the form of the letter T; the bark is raised on both sides, for which purpose the handle of the *budding-knife* generally terminates in a thin ivory blade, and the bud is inserted, the bark attached to the bud being cut across so as to join exactly to the transverse cut in that of the stock, that the bud may be nourished by the descending sap. The leaf in the axil of which the bud grew is cut off. The newly-inserted bud is for a time preserved in its place, and prevented from too much access of air by strands of bass-matting. The process just described is distinctively called *shield-budding*, and is the most common method of budding. Other methods are occasionally employed, as *reversed shield-budding*, in which the incisions are in the form of the letter T reversed, which is, sometimes practiced with trees of the orange family and others in which there is a very great flow of descending sap; and *scallop-budding*, in which a thin slip of bark is removed from the stock, and a similar slip bearing the bud is placed upon it, the upper edge and one of the lateral edges being made to fit exactly. Scallop-budding may be performed in spring, and if it fails, the ordinary method may be resorted to in summer. B. is also sometimes performed by taking a tube of bark with one or more buds from a small branch, and placing it upon a branch of similar thickness in the stock, from which the bark has been removed.

BUDDLE'A, a genus of shrubs of the natural order *scrophularinæ*, of which many species are known, all natives of the warmer parts of the world, and some of them much

admired for their beautiful flowers. *B. Neemda* has received the praise of being one of the most beautiful plants of India. *B. globosa*, a native of Chili, with downy branches, lanceolate leaves, and globose heads of orange-colored flowers, is hardy enough to endure the climate of most parts of England, and has become a very common ornament of gardens, but in Scotland it needs the protection of the greenhouse or frame.

BUDE BURNER and BUDE LIGHT. The B. B., so called from the name of the residence of the inventor, Mr. Gurney, consists of two, three, or more concentric argand burners, each inner one rising a little above the outer. On the same principle, a powerful light is produced by a number of flat flames disposed in concentric circles like the petals of a rose.—The Bude light, also the invention of Mr. Gurney, depends upon introducing oxygen into the center of the flame instead of air, as in the common argand. A light of the most dazzling brilliancy is thus produced. The house of commons is lighted by this means, the brilliancy being softened by the intervention of a ceiling of ground-glass.

BUDGELL, EUSTACE, an English writer for the *Tatler*, *Spectator*, and *Guardian*. He was under-secretary to Addison, and afterwards a member of the Irish parliament. Still later he was comptroller-general of the revenue in Ireland, from which office he was removed because of a lampoon written by him upon the lord lieutenant. In 1720, he lost £20,000 in the South Sea scheme, and afterwards spent £5000 to get into parliament, but did not succeed. Then he started the *Bee*, a weekly journal of short but stinging life. Lawsuits accumulated, and he ended his troubles by drowning, leaving on his table a slip of paper on which was written "What Cato did, and Addison approved, cannot be wrong."

BUDGET, from the same source as the French *bougette*, means a small bag, and has been used metaphorically to express a compact collection of things, as a budget of news, a budget of inventions, and the like. Water-budgets or buckets were a very honorable blazon on a coat-armorial, as being generally conferred in honor of some valiant feat for supplying an army with water. Guillim, in his *Display of Heraldry*, thinks the three mighty men in David's army who broke into the host of the Philistines, and drew water from the well of Bethlehem, "deserved to have been remunerated with such armorial marks on their coat-armors for their valor."

The term, "The Budget," is in Britain, from long usage, applied to that miscellaneous collection of matters which aggregate into the annual financial statement made to parliament by the chancellor of the exchequer. It contains two leading elements—a statement how the nation's account of charge and discharge stands in relation to the past, and an explanation of the probable expenditure of the ensuing year, with a scheme of the method in which it is to be met, whether by the existing or new taxes, or by loan. The statement of the budget is always an important, sometimes a very exciting occasion; as for instance, sir Robert Peel's adoption of an income-tax in 1842, and his legislation for free-trade in 1846. Another instance is Mr. Gladstone's reduction of the wine-duties and treaty with France in 1860.

BUDHANUH, a t. of India, in the British district of Mozuffurnuggur, n.w. provinces, on the route from Kurnoul to Meerut, 43 m. s. from Kurnoul. The surrounding country is wooded and well cultivated, and the bazaar of the town is well supplied. Pop. '72, 6162.

BUDINGTON, WILLIAM IVES, D.D., b. Conn., 1815; graduate at Yale, and in theology at Andover. He was ordained in 1840, and took charge of the first Congregational church in Charlestown, Mass., remaining there 14 years. He published a history of that church in 1845. In 1855, he took charge of the Clinton avenue church, Brooklyn, New York. Failing health compelled him to relinquish public duties early in 1879, and he died in December. Dr. B. was one of the acknowledged leaders in his denomination.

BÜDOS HEGY, a mountain belonging to the Carpathians, on the eastern border of Transylvania, in lat. 46° 12' n., and long. 25° 40' east. It is quite isolated, steep, and of conical shape, densely wooded on the lower slopes, and has an elevation of 7340 feet. It has numerous caverns, that emit sulphurous exhalations, and from its base issue strong sulphur springs.

BUDWEIS, a t. of Bohemia, situated on the Moldau, about 77 m. s. of Prague. B. is well built, is partially fortified, and has an old cathedral, manufactures of woollens, stone-ware, machines, lead-pencils, saltpeter, etc. It has also a brisk trade in grain, wood, coals, and salt. There are numerous schools, both for education in the Bohemian and in the German tongue. The Slavic name of B. is *Budejovice*. Pop. '69, 17,413. In the neighborhood is an old feudal fortress, the *Schloss Frauenberg*, one of the seats of prince Schwarzenberg, and a fine new Gothic castle also belonging to the same nobleman. Here he keeps herds of wild swine for the chase.

BUEL, JESSE, 1778–1839; a native of Connecticut, began life as a printer, and established the *Albany Argus* in 1813, continuing as the publisher until 1821, when he retired to a farm and became one of the most successful cultivators in the country. In 1834, he started the *Albany Cultivator*, and subsequently published the *Farmer's Instructor* and the *Farmer's Companion*.

BUELL, DON CARLOS, b. Ohio, 1818; a graduate of West Point; served in the Florida and Mexican wars, from 1849 to 1861 assistant adjutant-general in various military departments; in the latter year commanding the department of the Ohio, and in 1862 made maj.gen. of volunteers. He was mustered out in 1864, and resigned his command.

BUENA VISTA, a co. in n.w. Iowa, traversed by the Dubuque and Sioux City rail-road, and watered by Coon and other rivers; 576 sq.m.; pop. '70, 1585. Agriculture is the main business. Co. seat, Prairieville.

BUENA VISTA, a small settlement in Coahuila, Mexico, on the San Juan, a tributary of the Rio Grande, 7 m. s. of Saltillo; the site of a battle between the United States forces under gen. Taylor and the Mexicans under Santa Anna, Feb. 23, 1847, the former with 5200 men and the latter with about 20,000. After two days of sharp fighting, Santa Anna was defeated with a loss of nearly 2000; Taylor's loss being 746. The result was due in great part to the superior effectiveness of Taylor's artillery.

BUEN AY RÉ, in Spanish, or **BOX AIR** in French, an island in that subdivision of the West Indies which runs parallel with the coast of Venezuela. It is in lat. 12° 20' n., and long. 68° 27' w., being 30 m. to the e. of Curaçao, which, like itself, belongs to the Dutch. B. A. produces cattle and salt. It measures 20 m. by 4, and contains about 4000 inhabitants. It has a tolerable harbor on its leeward or s.w. side.

BUENOS AY RES, a province of the Argentine Confederation in South America, of which the city B. A. is capital, extends itself along the Atlantic, from the mouth of the Plata to that of the Rio Negro on the 41st parallel; on the n.e., it is washed by the Plata and the Parana as far as the Arroyo del Medio; on the n. and the adjacent section of the w., it touches the province of Santa Fé. Elsewhere, its borders cannot be defined, constantly advancing, by slow and perilous steps, into the domain of the aborigines, for here the contest is not with the wilderness itself, which is a boundless prairie, but with its tenants, who, having an unlimited supply of horses for all purposes, are secured, in their every foray, alike against famine and fatigue. Its area is estimated at 63,000 sq.m., with a pop. of (1869) 495,107. Besides the existing province of the name, it at one time comprised Uruguay or Banda Oriental, Paraguay, Bolivia, and the Argentine Confederation, being originally an appendage of Peru, under the immediate command of a capt gen., and becoming, in 1775, a separate vice-royalty of itself. Though the first three of these four divisions broke off chiefly in connection with the revolutionary struggle, yet the fourth continued, down to 1853, to recognize the city of B. A. as its head; and the inland states endeavored both by war and diplomacy to re-annex the maritime province to the republic, till, in June, 1860, their object was obtained, and B. A. became once more a province of the Argentine Confederation.

The country approaches so nearly to a plain, that most of the rain which falls is either absorbed or evaporated, or lost in salt-lakes, comparatively little drainage entering the Parana or the Plata. The climate, though on the whole healthy and agreeable, is yet by no means steady or uniform. Every wind, in general, has, to a remarkable degree, its own weather—sultriness coming from the n., freshness from the s., moisture from the e., and storm from the w.; and besides the periodical heats of every summer, successive years of more than ordinary drought occur. Agriculture, properly so called, is followed chiefly in the more temperate and humid districts of the eastern coast; while the interior presents almost uninterrupted pasturage to countless herds of horses and cattle. Under these circumstances, the business of grazing and hunting combined occupies or interests the great bulk of the population—a business that renders the province, whether as to the disposal of its productions or as to the supply of its wants, peculiarly dependent on that external commerce, which, throughout the whole of Spanish America, has naturally been identified with political freedom. Let it be added that the Indians are intractable, and that the Africans, few in number at best, are principally menials; and it is seen at once why, in spite of national jealousies and sectarian prejudices, immigration from Europe has been not only tolerated by public opinion, but also encouraged by legislative enactments. Moreover, a comparatively congenial climate, as a recommendation to foreigners, has powerfully seconded the efforts of liberality and patriotism. It is perhaps mainly owing to this cause, which is common alike to Chili and to B. A., that these two districts, notwithstanding their full share of wars and troubles, have so decidedly outstripped the other fragments of the same colonial empire in all the elements of liberty and civilization. Hence their higher importance in the eyes of Europeans in general, and of Englishmen in particular. B. A. is the largest, most populous, and most flourishing of the provinces which comprise the Argentine Confederation. Numerous railways traverse it, emanating from the city of B. A., and extending to other parts of the republic. The annual immigration into B. A. is from 15,000 to 20,000.

BUENOS AY RÉS, a city of South America, on the right bank of the Plata, which here, at a distance of 150 m. from the open sea, is 36 m. across. It stands in lat. 34° 36' s., and long 58° 24' west. Its disadvantages as a maritime town are great; the flood-tides of the ocean, when backed by easterly winds, being apt to make the estuary overflow its banks; and again, when westerly winds prevail, the estuary loses both width and depth. Monte Video, on the opposite shore, possesses a better harbor, and is nearer to

the Atlantic, nor can it be doubted that, but for the greater facilities of B. A. in carrying on an inland trade, the former town would have proved a dangerous rival. Steam is rapidly placing both upon more equal terms. Of the trade, however, with Chili by Mendoza and the Andes—a trade which must always be carried on by land—B. A. must still command the monopoly. So familiar had B. A. become with land-carriage on an extensive scale, that its merchants, when blockaded in front during a war with Brazil, established, as it were, a new port of entry in the mouth of the Salado or Saladillo, at a distance of at least 150 miles. As a city, B. A. labors under some peculiar disadvantages. Its supplies of fresh water are received from the Plata in rudely constructed carts, though a thorough scheme of water-supply and drainage is now being carried out. Its immediate territory, purely alluvial, is almost as destitute of timber as of stones—the latter being brought either as ballast from Europe, or as freight from Martin Garcia, an island on the opposite side of the estuary; and the former from the province of Entre Rios, and from the islets of the Uruguay and the Parana. Fuel is almost as scarce as building material—peach-trees and the withered thistles of the prairies yielding the only indigenous supplies. B. A., which appears to deserve its name of *good airs*, contains (1869) 177,787 inhabitants—about a third of whom are of European birth or descent. Among the Europeans the vast majority are Spanish, Italian, French, and British. B. A. publishes newspapers in French, English, Italian, and German, as well as in Spanish. The city is partitioned into blocks of about 150 yards square, by granite-paved streets. New houses are everywhere springing up; tramways traverse it in every direction; and the value of property has enormously increased. The principal buildings are the cathedral and its dependent churches. Episcopalian and Presbyterian chapels, a founding hospital, an orphan asylum, the university, a military college, several public schools, and the government offices; there are also printing establishments, and manufactories of cigars, carpets, furniture, and boots and shoes. The exports consist of precious metals, hides, beef, wool, skins, tallow, and horse-hair; and the imports of cottons, linens, woollens, jewelry, perfumery, and deals. The custom-house dues, which in 1860 were \$3,000,000, in 1870 had increased to \$13,000,000. The value of imports in 1873 was £11,886,861, and of exports, £6,886,506. B. A. was founded in 1535; but having subsequently been twice destroyed by the Indians, it ought, in reality, to date only from 1580. In the beginning of the present century, it achieved, with very little aid from home, two triumphs over England. In 1806, one British force, which had just captured the city, was obliged to surrender; and in 1807, another which attempted to recover the place, was repulsed with heavy loss; and these successes over so formidable a foe emboldened the colonists, three years afterwards, to throw off the yoke of Spain.

BUFFALO, *Bos bubalus*, an animal of the ox tribe, very important and useful to man. It is a native of the East Indies, where it has been long domesticated, and from which it was carried to Egypt and to the south of Europe. It was introduced into Italy about the close of the 6th c. A. D., and is now very generally used as a beast of draught and of burden in that country, as it is also in India.

The B. is larger than the ox, and its limbs are stouter. Its form is more angular and clumsy; the head is larger in proportion to the size of the body; and the forehead is rather convex, and higher than broad; the dorsal line rises into a considerable elevation above the shoulders; the dewlap and the tail resemble those of the ox; the horns are large, slightly compressed, recline towards the neck, and have their points turned up. It is characteristic of the B., when walking or running, to carry the head with the muzzle projecting straight forward, and the horns laid back on the shoulders. The hair is irregular and bristly, often very thin, so that the smooth brown hide "shines with an unpleasant polish in the sunlight." In this as in other respects, the animal is adapted for marshy situations, which it naturally affects; preferring for its food the rank coarse herbage which they afford, delighting to immerse itself in water till only its head appears above the surface, in which condition it will remain for hours, and often enveloping itself in mud as a protection against insects. On account of these propensities, the buffaloes used as beasts of burden in India are seldom laden with any goods liable to be spoiled by water, as the animal is always ready to take an opportunity of lying down with his load in any river or pond which presents itself. In Italy, the B. seems nowhere more at home than in the Pontine marshes and the pestilential Maremma. The very regions where malaria is most prevalent seem to be those most adapted to its constitution.

The B. is a very powerful animal, much more powerful than the ox, and capable of dragging or carrying a far heavier load. The female yields a much greater quantity of milk than a cow, and of excellent quality. It is from B. milk that the *ghee* or semi-fluid butter of India is made. The hide is greatly valued for its strength and durability, but the flesh is very inferior to that of the ox.

The B. exhibits a considerable amount of intelligence. In a state of domestication, it is capable of becoming very docile. In the s. of Europe, it is generally managed by a ring passed through the cartilage of the nose, but in India by a mere rope. The Indian driver rides upon a B.; but these animals keep so closely together as they are driven along, that, if necessary, he walks from the back of one to that of another perfectly at his ease. In a wild state, the B. is savage and dangerous, and even in domesti-

cation it is apt to resent injury. The native princes of India make buffaloes and tigers fight in their public shows; and the B. is more than a match for the tiger, even in single combat. The appearance of a tiger excites a herd of buffaloes, much as we see oxen excited by the approach of a dog; and if his safety is not secured by flight, they kill him, tossing him from one to another with their horns, and trampling him with their feet.

The B. is used in some parts of the east in the shooting of waterfowl, being trained to the sport, and sold at a considerable price. The sportsman conceals himself behind the B., which, being a familiar sight, is not alarming to the birds.

The CAPE B., *Bos Caffer*, is generally regarded as a distinct species. It seems never to have been reduced to the service of man, although there is reason to believe it to be very capable of domestication. The horns are very large; they spread horizontally over the top of the head, and are then bent down laterally, and turned upwards at the point. The head is carried, as by the common B., with projecting muzzle and reclining horns, but the bases of the horns nearly meet on the forehead, where they are from 8 to 10 in. broad. The length of a full-grown Cape B. is about 8 ft. from the root of the horns to the tail, and the height $5\frac{1}{2}$ feet. This animal is regarded as more formidable than any other in South Africa; and the hunter will more readily risk an encounter with a lion than offer any provocation to a B. without great advantages for the combat, or great facilities for escape. The B. is still found in large herds in the interior of South Africa, but in Cape Colony, where it was once plentiful, it has now become comparatively rare. The hide is so thick and tough that the Caffres make shields of it, impenetrable to musket-shot: and the balls used by the huntsmen in shooting the animal are mixed with tin, and yet are often flattened by the resistance. The Cape B. grazes chiefly in the evening, and lies in woods and thickets during the day.

An attempt has been made to establish a genus, *bubalus*, naming the common B. for its type; but the characters lack precision, and the limits are uncertain.—The *buffalo* of the Anglo-Americans is the American bison. See BISON.

BUFFALO, a co. in central Dakota, on the Missouri river; 750 sq. m.; pop. '70, 246. Iron ore has been discovered.

BUFFALO, a co. in central Nebraska, on the Platte river; 850 sq. m.; pop. '76, 4396. Soil fertile. The Union Pacific railroad passes through. Co. seat, Gibbon.

BUFFALO, a co. in w. Wisconsin, on the Mississippi and Chippewa rivers. Grain and wool are the main products; 650 sq. m.; pop. '75, 14,219; in '80, 14,752. Co. seat, Alma.

BUFFALO, a city of the state of New York, standing at the mouth of Buffalo river, which enters lake Erie within 2 m. of its outlet, the Niagara river. In 1801, when B. was founded, the basin of its fresh-water sea contained certainly fewer than 50,000 inhabitants, and seemed cut off from commercial communication by the Niagara falls on the e. and the currents of the Detroit and St. Clair on the west. But these and other natural disadvantages have been made to vanish. The construction of piers and breakwaters in the river and at its mouth have removed the bar, and given B. one of the best harbors on the lakes. Steam has brought lakes Huron, Michigan, and Superior within easy reach. Its commerce is large, the grain trade being the most important item in it. The receipts of grain and flour during the decade ended in 1874 amounted to 522,874,944 bushels. There are more than 30 elevators in B., with storage capacity for upwards of 7,000,000 bushels. Next to the traffic in grain is that in live-stock. In 1874, 504,594 cattle, 783,800 sheep, 1,431,800 hogs, and 21,937 horses, amounting in value to nearly \$60,000,000, passed through Buffalo. British improvements along the Niagara and the St. Lawrence, available as they are for sea-going ships, have rendered B. a maritime emporium. The Erie canal, 364 m. long, has connected B. as its terminus with the tide-waters of the Hudson; while three other enterprises of the kind, commencing respectively at Erie, Cleveland, and Toledo, have linked lake Erie at three or rather four points with the Ohio, and through it with the Mississippi. Since about 1862, its lake commerce has much decreased, owing to the increase of railway facilities, and manufacturing industries have taken the lead. Among manufactures, that of iron is the chief. Ship-building is also largely carried on, and there are extensive wool-factories and numerous saw-mills. The rise of B. has been remarkably rapid; in 1810, there were 1508 inhabitants; 1830, 8653; 1850, 42,261; 1870, 117,714; and in 1875, 134,573. The city debt in 1878 was \$7,509,257; and the valuation, \$99,975,575. In 1814, the British burned Buffalo. In 1825, the Erie canal was opened.

B. is situated in lat. $42^{\circ} 53'$ n., and long. $78^{\circ} 55'$ west. It is regularly built. Its streets are straight and broad—Main street, in particular, being 2 m. long and 120 feet wide; and its squares, which are 3 in number, are shaded by rows of trees. The most prominent public buildings are the city and county hall, erected at a cost of \$2,000,000, custom-house, post-office, arsenal, penitentiary, and an asylum for the insane. There are nearly 80 churches, a university, 8 daily newspapers, several libraries, etc. It is divided into 5 wards, and is governed by a mayor and council annually elected.

BUFFALO (*ante*), city, a port of entry, and the seat of justice of Erie co., N. Y., in $42^{\circ} 53'$ n., $78^{\circ} 55'$ w., at the foot of lake Erie, at the mouth of the Buffalo river and at the head of Niagara river, which is here crossed by an iron bridge. The city has a water

front of about 5 m., running $2\frac{1}{2}$ m. along the shore of the lake, and $2\frac{1}{2}$ m. along Niagara river. It is connected with Goderich on lake Huron by the Buffalo and Lake Huron railroad; with Detroit by the Great Western railway; with Toronto and Montreal by the Grand Trunk railway. The climate is pleasant and healthful; the streets, broad and generally lined with trees, are well paved, lighted, and supplied with sewers. There are many fine residences with attractive grounds, and numerous squares and public places. A combination of parks and pleasure grounds has been laid out, extending to over 500 acres. It comprises three sections, situated respectively in the northern, western and eastern parts of the city, which, with the connecting boulevards, afford a drive of nearly 10 miles. In population Buffalo is the third city in New York, and the thirteenth in the United States. It was founded in 1801, became a military post in 1813, and was burned by the British on the last day of the same year. After the war the place was rebuilt, and in 1832 it attained the rank of a city. In 1820, it contained 2095 inhabitants. After the opening of the Erie canal in 1825, its growth was rapid, the population being 8653 in 1830; 18,213 in 1840; 42,261 in 1850; 81,129 in 1860; 117,714 in 1870; 134,238 in 1875, and 154,766 in 1880. A portion of the river front is a bold bluff 60 ft. above the lake and the Erie canal, which passes near it. There are 5 public squares, Niagara, Lafayette place, Washington, Franklin, and Delaware place. The principal streets are Main street, about 3 m. in length, Niagara street, 4 m., and Delaware street, 3 miles. The most important public buildings are the city and county hall, a granite structure, erected at a cost of over \$2,000,000, in the form of a double Roman cross with a tower 245 ft. high; the United States custom-house and post-office; the state arsenal, the Erie co. penitentiary, which is one of the 6 penal establishments of New York; and the state asylum for the insane, an edifice which cost about \$3,000,000, and has a front of 2700 ft. and a capacity for 600 patients. There are 76 churches, the most imposing edifices being St. Joseph's cathedral (Roman Catholic) and St. Paul's (Episcopal). The churches are divided among the various denominations as follows: 18 Roman Catholic, 11 German Lutheran and Evangelical, 10 Episcopal, 10 Methodist, 9 Presbyterian, 8 Baptist, 4 Mission, 2 Jewish, 1 French Protestant, 1 Congregational, 1 Unitarian, 1 Universalist, and 1 Friends'. The Forest Lawn cemetery in the suburbs contains 75 acres, tastefully laid out. There are 9 daily newspapers, 5 in English and 4 in German, 10 weeklies, and 7 periodicals issued monthly. The educational institutions comprise a state normal school, 50 public schools with an average of 353 teachers and 21,808 pupils, and a number of collegiate schools and academies. Among other educational institutions are Canisius college, founded by the Jesuit fathers; St. Joseph's college, conducted by the Christian brothers; Martin Luther college (theological); St. Mary's academy and industrial school for girls; and the medical college of the university of Buffalo. The charitable institutions of the city are numerous. The Buffalo orphan asylum, founded in 1835, occupies a fine building in Virginia street. The St. Vincent's asylum for orphan girls is under the care of the sisters of charity. The St. Joseph's asylum for orphan boys, founded by the Roman Catholic church, has a reformatory institution connected with it. The church charity foundation (Episcopal) supports a home for aged and destitute females opened in 1858, and an orphan ward organized in 1866. The St. John's orphan home is under the care of the Evangelical Lutheran church. The Ingleside home was organized in 1869 for the purpose of reclaiming erring women. Among other charities are the St. Mary's asylum for widows, foundlings, and infants; the Buffalo general hospital in High street; the Buffalo association for the relief of the poor; and a homeopathic hospital founded in 1872. B. has 3 national banks, 6 state banks, and 5 savings banks. The Young Men's association has a library of 30,000 volumes, and real estate valued at about \$250,000. This society owns St. James hall, which is greatly in demand for concerts and lectures; and their large library building is occupied by the Buffalo historical society with its large library and cabinet; by the society of natural sciences, which has made an extensive collection of minerals and fossil casts; by the academy of fine arts; and by the mechanics' institute. The Young Men's Christian union and the German Young Men's association have good libraries. The Grosvenor library contains about 15,000 volumes of valuable reference works.

The city government is composed of a mayor, a common council of 26 members (2 from each of the 13 wards), a treasurer, controller, city attorney, superintendent of education, city engineer, overseer of the poor, and 3 assessors. It is often claimed that B. is the healthiest city of the United States, having the best water and the most complete sewerage; its water-supply is procured from the Niagara, through a tunnel extending almost to the middle of the river. The police department, with a force of 174 men, is under the control of a board of three commissioners. The city has a paid fire department, 3 volunteer hook-and-ladder companies, and a volunteer protection company; a fire and police alarm telegraph, with 70 m. of wire, 68 signal-stations, and 27 alarm-gongs. The telephone has been introduced and extends to various parts of the city. The gas of B. is supplied by three private companies. There are several lines of street railroads. The total debt of the city in 1879 was \$7,514,264.72; the assessed valuation of property was \$88,876,545; (real estate, \$80,929,165; personal property, \$7,947,380).

The position of B. on the great water and railway channels of communication between the west and the east gives it a large commercial importance. Its harbor is capacious,

and is protected by extensive breakwaters. The city is the center of an important system of railroads: it is the eastern terminus of the Lake Shore and Michigan Southern railroad, of the Canada Southern, and a branch of the Grand Trunk railroad of Canada; it is the western terminus of the Erie canal, the New York Central railroad, and a division of the Erie railway; and other lines converge here. There is a board of trade, organized in 1844 and incorporated in 1857. The immense quantities of grain moving from western states to the sea-board constitute the most important feature of the commerce of the city. The facilities for handling and storing it are unexcelled by those of any other city on this continent. The first grain elevator was built in 1843 by Joseph Dart, and thirty years from that date, in 1873, there were 32 elevators, with a capacity for handling 3,000,000 bushels a day. The record of receipts and exports is as follows: receipts, 1836-45, 41,851,483 bushels; 1846-55, 174,717,437 bushels; 1856-65, 432,390,318 bushels; 1866-75, 571,255,254 bushels. During the same length of time the exports kept pace with the receipts. Many of these elevating warehouses are costly structures of stone, or of iron and brick; several of them have grain "driers" attached. The live stock trade of B. is second only to the grain trade, but will probably exceed it before long. For the accommodation of this branch of business the New York Central railroad company has built large yards in the eastern suburbs; these yards are well sheltered, paved, watered, and taken care of with strict regard to cleanliness. In the amount of this business this city has third rank among the cities of the United States. B. has a large trade in anthracite and bituminous coal, received from Pennsylvania and distributed both e. and w.; great improvements have been made lately for handling and shipping this article. The rapid growth of the coal trade may be seen from the fact that the lake shipments westward during the season of 1879 amounted to 612,976 tons against 325,676 tons in 1878. The lumber and timber trade is large, although want of harbor and proper storage has driven a great part of it to Tonawanda on the Niagara river, about ten miles below Buffalo. The receipts in 1879 amounted to 207,531,000 ft., exceeding those of 1878 by 30,000,000 feet.

The manufacturing interests of B. are extensive, and have grown with marked rapidity in recent years, especially the manufacture of iron, which is carried on in more than 36 large establishments, employing 5000 men. The leading establishments are blast furnaces, rolling-mills, foundries, breweries, tanneries, manufactories of agricultural implements, and flour-mills. Of the last-named there are eleven, with a yearly capacity of 839,000 barrels; the average annual production of flour being about 250,000 barrels. Wooden ship building was formerly carried on here, but it has been superseded by iron ship building. Two extensive establishments are devoted to this industry; these have constructed the finest lake steamers, besides supplying the government with a number of iron revenue vessels.

BUFFALORA, a small t. of Lombardy, about 25 m. n.n.w. of Pavia, on the Ticino, here crossed by a bridge. The Austrians commenced the Italian campaign of 1859 by entering Piedmont at this point. The bridge was partially blown up by Austrian engineers. Pop. 1250.

BUFFET, an article of furniture formerly serving the same purpose as a sideboard, which has now superseded it. B. is the name given in France to a refreshment bar.

BUFFIER, CLAUDE, 1661-1737; a French psychologist and metaphysician, from the most of his life a lecturer in the Jesuit college in Paris. His best known work is *Traite des Verites Premieres*, in which he intended to discover the ultimate principles upon which all knowledge is based. He wrote also on the elements of metaphysics, and a French grammar on a new plan.

BUFF LEATHER is usually made out of salted and dried South American light ox and cow hides. After being limed in the usual way, they are unhaired and rounded, so that only the best part of the hide is made into buff leather. The grain and flesh being then scraped or cut off, the true cuticle, which is of a flexible fibrous nature, alone remains. The hide is next sprinkled over with cod-oil, and placed in the *stocks*, where it is worked for about 15 minutes. Having been taken out and partially dried, it is again submitted to a similar process of oiling and stocking; and during the first day, these operations may be repeated six times, decreasing daily for about a week, when one oiling and stocking in a day is sufficient. The hides are then placed in a stove, and subjected to a process called "heating off" after which they are scoured and rendered free from oiliness by being soaked in a strong lye of carbonate of potash. They are next worked well in the *stocks*, hot water being poured copiously upon them until the water runs off pure. Having been dried, they are subjected to a process called *grounding*—i.e., they are rubbed with a round knife, and also with pumice-stone and sand, until a smooth surface is produced. The leather, which is very pliant, and not liable to crack or rot, is now ready for the market, and is generally used for soldiers' belts and other army purposes.

During the early part of this century, the principal seat of the B. L. manufacture was in the neighborhood of Edinburgh, one manufacturer turning out, previous to the battle of Waterloo, about 1300 hides per week. In peaceable times, the demand for B. L. is comparatively small, and the manufacture is now almost confined to London and the neighborhood, where the raw material is most readily procured, and the demand

for the manufactured article is greatest. The natural color of the leather is light-yellow, but for some purposes it is bleached white. The precise chemical operation of the oil in the process of the manufacture is rather obscure, but as no glue can be got from hide that has been made into buff, the gelatine of the hide must have entered into combination with some of the constituents of the oil, and had its nature completely changed.

BUFFO (Ital. from corrupt Latin *buffa*, a slap on the cheek, as practiced by clowns and mountebanks in farces), an Italian theatrical term applied to an actor or operatic singer who takes the light or humorous part in an opera or play. A burlesque opera is called *opera buffa*, and a burlesque play, *commedia buffa*.

BUFFON, GEORGE LOUIS LECLERC, Comte de, one of the most famous naturalists and writers of the 18th c., was b. at Montbard, in Burgundy, Sept. 7, 1707. He studied law at the college of Jesuits at Dijon, but showed so marked a predilection for astronomy and mathematics, that his father allowed him to follow his own inclinations. At Dijon, he became acquainted with lord Kingston, whose tutor, a man of learning and taste, directed the mind of B. to the study of the sciences. With lord Kingston and his tutor, B. traveled through France and Italy, and came to England, where, to improve his knowledge of our language, he translated Newton's *Fluxions* and Hales' *Vegetable Statics*. In 1733, he wrote several original essays, which gained notice in the academy, of which he had been made a member. His general love of science received a definite impulse toward zoology by his appointment, in 1739, as intendant of the royal garden and museum. Hitherto zoology, consisting of a series of unconnected observations and fruitless attempts at classification, had been commonly regarded by educated readers as a dry study, and by savans as play-work. B. first conceived the idea of making it attractive to the first of these classes, and of securing for it, at the same time, the respect of the second. His plan was assuredly comprehensive enough, since he aimed at nothing less than a collection of all the separate known facts of physical investigation, and a systematic arrangement of these, to assist the author in forming a theory of nature; but B. possessed neither the science nor the patience necessary for such a task. Endowed, however, with a brilliantly rhetorical imagination, and always inclined to deliver himself from doubts and ignorance by sparkling hypotheses, the elaboration of which cost him little trouble, he contrived to produce a work which, if not severely scientific in its method, at least shone with what many then conceived to be the brightest literary luster. However, it is not to be denied that many of his views are very ingenious, although later researches have completely exploded them. The *Natural History* of B. made an epoch in the study of the natural sciences, though it has now little or no scientific value. His attempted explanations of natural phenomena were opposed by Condillac, who, with Helvetius, Diderot, D'Alembert, and others, also ridiculed, with a certain degree of justice, the excessive pomp of style used by Buffon. The most insignificant part of B.'s treatise is the mineralogy, for which he was quite unqualified by the deficiencies of his chemical, mathematical, and physical knowledge. The systematic and anatomical arrangement of the mammalia was executed by Daubenton, the colleague of Buffon. B.'s works passed through numerous editions, and several were translated into most of the languages of Europe. The best complete edition is the *Histoire Naturelle Générale et Particulière*, in 36 volumes (Par. 1749-88.) After receiving several high honors, being elevated to the rank of comte de B. by Louis XV., and treated with great distinction by Louis XVI., B. died in Paris, April 16, 1788. In person and carriage, B. was noble; as a Parisian academician, and a self-complacent, theoretical naturalist, dressed in courtly style, pursuing his pleasant studies in the *allées* of the royal garden, and largely participating in the vices of his time, B. was quite a model of a French philosopher of the 18th century. His son, Henri Leclerc, comte de B., b. 1764, was attached, at the outbreak of the revolution, to the party of the duke of Orleans, and fell under the guillotine. His last words were: *Citoyens, je me nomme Buffon*.

BUFFOON (Fr. *bouffon*), a low jester. The Italian *buffo* (from *buffa*, a farce) is the name given to a comic singer in an opera. In the corrupt Latinity of the middle age, *buffa* meant a slap on the cheek; and in the Italian, *buffare* signifies the puffing of wind through the mouth. It is probably from the favorite trick played by clowns in farces—one swelling out his cheeks with wind, the other slapping them, so as to make a ludicrous explosion—that the terms *buffones* in Latin, *buffoni* in Italian, *bouffons* in French, and in English *buffoon*, were derived. In Italy, the *buffo cantante* is distinct from the *buffo comico*; the former having greater musical talent, and sustaining a more important part, the latter having greater license in jocoseness. The voice of a *buffo cantante* is generally a bass, but sometimes a tenor buffo is introduced.

BUFORD, JOHN, 1826-63; b. Ky.; graduate of West Point, was capt. of dragoons in 1859. In the war of the rebellion he served on the union side, and was one of the most conspicuous and useful of cavalry officers, participating in many engagements, in one of which he was wounded. He rose to maj.gen. of volunteers.

BUG, a name applied to a large family of insects, *cimicidæ*, of the order *hemiptera* (q.v.), suborder *heteroptera*, and often still further extended in its signification so as to

include the whole of that suborder, the insects of the section *geocorisæ* being designated land-bugs, and those of the section *hydrocorisæ*, water-bugs, the latter including water-scorpions, boat-flies, etc. All these insects, and particularly the land-bugs, although some of them are radiant in beautiful colors, have a strong resemblance in form and structure to the annoying and disgusting house B. or bed B. (*cimex lectularius*). The statement that this insect was introduced into England with timber brought from America to rebuild London after the great fire of 1666, must be rejected as erroneous; for although it appears to have been comparatively rare in England, it was well known in some parts of Europe long before that time, and is mentioned by Dioscorides. The bed B. is destitute of wings—an anomalous peculiarity, as the insects of its order, and even of the same family, are generally furnished with them. The body is very flat, of a somewhat oval form; the whole insect is of a dirty rust color, emits an offensive odor, and is about three sixteenths of an inch in length; the legs are moderately long, and capable of being employed for pretty rapid motion; the antennæ are thread-like and very slender, about half the length of the body; the mouth is formed for suction alone, and is furnished with a sort of proboscis, which is three-jointed, forms a sheath for the true sucker, and when not in use is recurved under the head and thorax. The B. lurks during the day in crevices of walls, of bedsteads, and of other furniture, but is sufficiently active during the night; and when it finds opportunity, sucks blood until it distends itself. It seems, however, to be capable of subsisting long without food. Young bugs resemble their parents in most things, except size and the want of *elytra*, insects of this order not undergoing such marvelous transformations as those of some other orders. The best preventive of bugs in a house is *scrupulous attention to cleanliness*; but where the nuisance exists, it is not easily removed, and various means are employed for this purpose, of which one of the best and safest is thorough washing with spirit of turpentine, although recourse is even had to washing with a solution of corrosive sublimate.—Other species of B. (*cimex*) suck the blood of some of the inferior vertebrate animals, as pigeons, swallows, bats, etc.; but the greater number of insects of the B. family live by sucking the juices of vegetables. A small species (*tingis pyri*), which sucks the leaves of the pear-tree, is very destructive in some parts of Europe, where it is popularly called the *tiger*. Some of these winged wood-bugs or field-bugs are capable of inflicting very painful wounds. Flying-bugs, “enormous and fetid,” are among the pests of India. Night is the time of their activity. Warm countries generally have winged bugs of great size and beauty; but if touched or irritated, they “exhale an odor that, once perceived, is never after forgotten.” A winged B., as large as a cockchafer, lodges in the thatch and roofing of houses in Chili, and sallies forth at night, like the bed B., to suck blood, of which it takes as much as a common leech.—It is worthy of notice that a species of field B. (*acanthosoma grisea*), a native of Britain, is one of the few insects that have yet been observed to show affection and attention to their young. De Geer observed the female of this species, which inhabits the birch-tree, conducting a family of thirty or forty young ones as a hen does her chickens, showing great uneasiness when they seemed to be threatened with danger, and waiting by them instead of trying to make her own escape.

BUG, or Bog. There are two rivers of this name in Russian Poland. The Western B., the largest tributary of the Vistula, rises in Austrian Galicia, and after a course of about 450 English miles, and receiving numerous tributaries, it joins the Vistula at the fortress of Modlin, near Warsaw. It is navigable for a considerable distance. The Eastern B., the Hypanis of the ancients, rises in Podolia, and flows s. into the estuary of the Dnieper. Its length is more than 400 miles. It is navigable for small-craft as far as Wosnessensk. At the junction of the Ingul with the B., stands the city of Nicolaiw (q.v.).

BUGEAUD, MARSHAL, was b. at Limoges, in France, Oct. 15th, 1784. In his 20th year he entered the army as a private. His conspicuous bravery in the Prussian, Polish, and Spanish campaigns gained him rapid promotion. Shortly before the fall of Napoleon, B. was made a col., and in 1815 commanded the advance-guard of the army corps of the Alps. He afterwards retired to his estate, but was called into public life by the July revolution of 1830. He was elected deputy for Perigueux, and gained the esteem of Louis Philippe, who created him a marshal. In 1835, he voted against electoral reforms and universal suffrage, denounced “the tyranny of the press,” and soon contrived to make himself very unpopular. In Dec., 1840, he was appointed governor-general of Algiers. He immediately set about organizing the celebrated irregular force known as the zouaves, and in a few years the French arms were everywhere triumphant over the Arab tribes. The cruelty of some of B.’s proceedings excited strong feelings of reprobation at the time, as well in France as in Europe generally. In 1844, he gained a victory over the emperor of Morocco’s forces at Isly, for which he was created duc d’Isly. In the revolution of Feb., 1848, marshal B. had the command of the army in Paris, and would have dissuaded the king from signing the act of abdication; but panic made such counsel useless. Among all the friends of Louis Philippe, marshal B. seems to have been the only man who preserved firmness and presence of mind. When Louis Napoleon became president, he intrusted the chief command of the army of the Alps to B., who died of cholera in Paris, June 9th, 1849.

BUGENHAGEN, JOHANN, surnamed *Pomeranus*, or Dr. Pommer, one of Luther's chief helpers in the reformation, was b. at Wollin, near Stettin, in Pomerania, 1485; studied at Greifswald, and as early as 1503 became rector of the Treptow academy. There he lived quietly, fulfilling the duties of his office until 1520, when his religious views were changed by reading Luther's little book, *De Captivitate Babylonica*. B. was now seized, as it were, by the zealous spirit of the reformation, and, to avoid the persecutions of the Catholic party, he betook himself to Wittenberg, where his talents procured for him in succession several high positions. B.'s remarkable philological and exegetical powers were of great service to Luther in his translation of the Bible. In 1525, he opened the controversy between Luther and Zwingli by a treatise against the latter, to which Zwingli ably replied. He possessed a superior talent for organization, establishing churches in Brunswick, Hamburg, Lubeck, and Pomerania. In 1537, he was called to Denmark by Christian III. to reform the ecclesiastical establishments of that country. He accomplished this so admirably, that the Danes to this day consider him their reformer. In 1542, he returned to Wittenberg, and continued his energetic efforts to extend the new theology throughout his native land. He died 20th April, 1558. His best work is his *Interpretatio in Librum Psalmorum* (Nürnberg, 1523).

BUGHIS, or **BUGIS**, a Malay people in the island of Celebes. The merchants of these people do much of the trade of the island and the neighboring seas. Their government is an elective monarchy, the chief ruler being chosen by the nobles and the higher classes. He holds power only during good behavior, and may at any time be voted out of office. The people are represented as being orderly, peaceable, and well behaved; good good workers in iron, copper, cotton, etc.; constructing good houses and durable ships. Their language has been reduced to writing, and they use the common divisions of the year. They also use the magnetic compass and charts. Half a century ago they were represented as cannibals, but they were conquered by the Macassars and compelled to embrace Mohammedanism. In recent years they have settled colonies of their own people in some of the adjacent countries.

BUGLE, *Ajuga*, a genus of plants of the natural order *labiate*, having an irregular corolla, with very short upper lip and trifid lower lip, the stamens protruding. The species are mostly natives of the colder parts of the old world, and several are British. The common B. (*A reptans*) is abundant in moist pastures and woods. Its flowers are generally blue, but varieties occur with white and purplish flowers, which are often introduced into flower-borders. The Alpine A (*A. Alpina*) is one of the beautiful flowers of the Swiss Alps.

BUGLOSS, a name popularly applied to many plants of the natural order *boraginæ* (q.v.), as to the species of *anchusa* or alkanet (q.v.), etc. In some botanical works it is confined to the genus *lycopsis*, a genus differing from *anchusa* in little but the curiously curved tube of the corolla, and of which one species, *L. arvensis*, is a common weed in cornfields in Britain. The beautiful genus *echium* bears the English name of **VIPER'S BUGLOSS**.

BUHLE, JOHANN GOTTLIEB, 1763-1821; a German scholar and historian of philosophy; a graduate of Göttingen; at an early age occupied a professor's chair at Brunswick. Thence he went to Moscow as professor of ancient languages, and on his return to Brunswick took the chair of natural law, which he held during his life. He edited *Aratus*, and a part of *Aristotle*, and wrote a hand-book of history and philosophy, and a useful history of modern philosophy.

BUHL-WORK, or **BOOL-WORK**, is the name applied to a sort of inlaying of brass scrolls and other ornamental patterns in wood. The name is derived from its inventor, Boulé, an Italian cabinet-maker, who settled in France in the reign of Louis XIV. He employed veneers of dark-colored tortoise-shell, inlaid with brass. Cabinets of his manufacture are highly prized, as are also those of his contemporary Reisner, a German, who used a ground of tulip-wood, inlaid with flowers, etc., in darker woods, and varied with margins and bands of light wood, with the grain crossed for contrast. This modification of buhl-work is correctly called Reisner work. For details of the methods of working, see **INLAYING** and **MOSAIC**.

BUHREACH', or **BHARAICHI**, a t. of Oude, India, the principal place of a district of the same name. It is in n. lat. 27° 34', e. long. 81° 33'—65 m. n.e. of Lucknow. It is an old town, of considerable size, situated in a pleasant wooded plain, on the left bank of the Sarju. The houses are mostly built of mud and covered with thatch; but the mausoleums, mosques, and residences of merchants are of brick and lime-mortar. North-east of the town is the tomb of Selar, a reputed Mussulman saint, to which there is a great concourse of pilgrims annually in the month of May. Pop. '71, 18,889; of district, 774,640.

BUHRSTONE, a variety of quartz (q.v.), containing many small empty cells, which give it a peculiar roughness of surface, particularly adapting it for millstones. The name is given without reference to geological relations, but it is *rein quartz*, rather than true *quartz rock*, which ordinarily assumes the character of buhrstone. There are different varieties of B., some of which are more compact, or have smaller cells than others; and those in which the cells are small and very regularly distributed, about equal in diameter

to the spaces between them, the stone being also as hard as rock-crystal, are most esteemed. Good B. is found at Conway in Wales, and at several places in Scotland; but the finest millstones are obtained from the quarries of La Ferté-sous-Jouarre, in the department of Seine-et-Marne, near Paris. A single millstone in one piece of 6 ft. diameter, sells for about £50, and one formed of several pieces for about £33. It is not unusual to form millstones of pieces of B. cut into parallelepipeds, like great wedges of soap, and bound together by iron hoops. The stone is found in beds or in detached masses, and the mode of quarrying is peculiar. When the mass is large, it is cut out into the form of a huge cylinder; around this, grooves are cut, at distances of about 18 in., the intended thickness of the millstones; into these grooves wooden wedges are driven, and water is thrown upon the wedges, which, causing the wood to swell, splits the cylinder into the slices required.—Millstones are not always made of B., but sometimes of silicious gritstones, of sandstone, and even of granite. B. millstones are extremely durable.

BUIR, BERNARDO, d. 1520; a Spanish Benedictine monk, in 1493 sent by the pope as apostolic vicar to the new world, accompanying Columbus on his second voyage. In 1495, he returned to Spain, and was one of the foremost in pressing charges against the unfortunate discoverer.

BUILDING, the art of erecting or building houses and other edifices, in which several distinct professions are usually and more immediately concerned. At the head of the building-trade is the architect, who is employed to draw plans and make out specifications of the work to be performed. The builder acts ministerially; his duty consists in carrying out the plans put into his hands, according to certain stipulated terms. The profession of the architect demands not only much imaginative power, but great artistic skill, along with a practical knowledge of details. Endeavoring to realize the wishes of his employer, the architect devises what shall be the external effect and interior accommodation of a building, and portrays the whole on paper with rigorous accuracy. Besides general designs to give an idea of the structure and its interior arrangements, he furnishes the working-plans or drawings, which are to guide the different mechanics—masons, joiners, etc.—in their several operations. These services of the architect, of course, involve much thought and labor, and he is therefore under the necessity of employing a staff of assistants, by whom the plans are executed under his orders. The making out of the specifications is a matter of careful study. To perform this part of his duty properly, the architect needs to be acquainted with the qualities of different kinds of materials; such as stone, lime, sand, bricks, wood, iron, etc. A knowledge of the strength of timber is particularly desirable. When the specifications are made out, they and the contract are subscribed by the builder. To insure as far as possible a faithful adherence to the specifications, the architect appoints a "clerk of works" to keep watch over the whole operations, and who is authorized to check any seeming fault. During the whole proceedings, the architect is paramount. For the due execution of his plans, he feels that his professional reputation is at stake; and, accordingly, having involved his responsibility, the employer cannot with propriety interfere to make alterations while the work is in progress. Such is the etiquette of the profession. Should alterations be desirable, they become matter for a fresh agreement among the parties. When the works are finished, the builder hands his account to the architect to be examined and checked. If satisfied of its correctness, he grants a certificate of the fact, and this is the warrant for payment by the employer. The builder having been settled with, the employer now pays the architect's fee, which closes the transaction. This fee may be one, two, or more per cent on the entire cost of the B., according to local usage or terms agreed on; whatever it is, it covers all charges for advice, plans, and other professional trouble.

Builders undertake work by "contract," or by "schedule of prices." If by contract, they engage to execute the whole works for a stipulated sum. If by schedule of prices, they agree to abide by the measurements of valuers appointed by the architect. These valuers go over the works when finished, and, taking an exact account of everything, compare it with the account rendered by the builder; the architect being the ultimate referee. It is exceedingly important, for the sake of an amicable adjustment of accounts, that the builder should adhere scrupulously to the letter of the specifications—i.e., the covenant under which he has become bound. He can justify no departure from the specifications, on the plea that something as good has been given or done, or that he was not checked at the time by the clerk of works. Being explicitly a person employed to do a certain piece of work, in a certain way, he is in no respect entitled to substitute his own notions for those of his employers.

It may happen that a proprietor acts as his own architect, and employs a builder to execute his designs, on the understanding that he is to pay for everything according to a schedule of prices. In many instances, the builder is proprietor as well as architect, and merely carries out his own plans. Such is generally the case in the neighborhood of London, where builders speculate in leasing land and erecting rows of dwellings for sale. This plan is greatly facilitated by the opportunity of buying every article required in house-building ready for use, such as bricks, door-steps, hearthstones, joists, flooring, doors, windows, marble mantel-pieces, slates, etc. In fact, house-building in the metropolitan district is very much reduced to a system of purchasing and putting together

certain articles from manufactories and depots. For this kind of business, there may be said to be establishments for the sale of doors and windows, as there are shops for the sale of nails, locks, and hinges.

The application of a comprehensive manufacturing system in the preparation of various parts of a building is observable most particularly in certain establishments of great magnitude. The test is this—whether the builder conducts so gigantic a trade as to warrant him in setting up a steam-engine of great power, and in providing highly wrought machines for cutting and otherwise treating wood, stone, etc. When once this degree of magnitude is reached, the operations are conducted under very great advantage. The Crystal palace in Hyde park could never have been built at the stipulated cost, nor in the required space of time, but by the application of steam power to work the machines which shaped and grooved the *two hundred miles* of sash bars; by the resources of the largest English establishment in the glass-trade, in making 1,000,000 sq. ft. of sheet-glass; and by the skill and capital of our great iron manufacturers, in rapidly producing 3000 iron columns, and more than that number of iron girders. When the late Mr. Thomas Cubitt was engaged in the vast building operations at Belgravia (a district in the w. of London owned by the marquis of Westminster), his factory on the banks of the Thames was the most complete ever known in the trade. It exemplified both the principles adverted to above—the manufacture of various articles by steam-worked machinery; and the collecting of large stores of other articles made in a similar way by other firms. There was a store of drawing-room and parlor doors, a store of window-sashes, a store of street-doors, and stores of mantel-pieces, stone and marble steps, balusters, slates, knockers, bells, and all the materials for house-building from the coarsest to the finest. There was also observed that systematic gradation of kinds and dimensions which is so much attended to in the higher kinds of machinery, and which so much expedites all operations; seeing that one particular piece would not only fit into or against another, but into or against any one of a whole class to which that other belonged. A house built in this systematic way partakes a good deal in the nature of a large machine, in which all the parts fit together with very great accuracy. There can be little doubt that if skill and capital be judiciously applied in this way, a house ought to be better built and to cost less than if built in the ordinary unsystematic manner. It may also be mentioned here that Mr. Cubitt was the owner of a very large brick-making establishment on the banks of the Medway, between Rochester and Maidstone, where steam-power was employed in all the operations of making bricks. Some of the great railway contractors, who have become millionaires, were originally house-builders, alive to the grand results producible by the combination of steam-worked machinery with the labor of well-organized bodies of men.

As an art, B. is of vast antiquity, and has assumed different forms, according to the necessities of mankind and the materials readily at their disposal. In ancient Egypt, Greece, and Italy, B. in stone rose to a high state of perfection, and till the present day it may be said that the greatest progress in the art is made only where stone of a manageable kind is conveniently at command. Rome, Paris, Lyons (with very many Italian and French cities), Bordeaux, Brussels, Munich, Geneva, Vienna, Edinburgh, and Glasgow are specimens of what may be achieved in stone workable with the chisel; Aberdeen is mainly built of granite. On the other hand, London, the greatest city within the bounds of civilization, is built of brick; so likewise are Manchester and Liverpool; also Amsterdam, Rotterdam, and other towns in Holland; and as a general fact, it would appear that wherever brick has to be resorted to, there the allied arts of architecture and building, as regards domestic accommodation and elegance of style, are on a poor scale. B. with stone of a superior kind is now becoming common in New York, Philadelphia, and some other American cities. It is not necessary to trace in this article the various processes embraced in the comprehensive term BUILDING; seeing that all the materials used, and all the operations conducted, are noticed under the proper headings in the encyclopædia.

BUILDING ACT FOR LONDON AND ITS NEIGHBORHOOD. See METROPOLIS LOCAL MANAGEMENT ACT.

BUILDING LEASES. In the law of England, a building lease is a demise of land for a long term of years, the lessee covenanting to erect certain houses or edifices thereon, according to specification. By the 19 and 20 Vict. c. 120, amended by the 21 and 22 Vict. c. 77, and which acts also apply to Ireland, the court of chancery is empowered to authorize leases of settled estates and B. L., which shall take effect in possession within one year next after the making of the same; the term for such building lease being 99 years; or where the court shall be satisfied that it is the usual custom of the district, and beneficial to the inheritance to grant B. L., for longer terms, then for such term as the court shall direct. By a subsequent enactment, it is declared that the term building lease shall include a repairing lease, but such repairing lease to be for a term not exceeding 60 years.

By the 5 and 6 Vict. c. 108—passed to enable ecclesiastical persons to grant long leases for building, repairs, or other improvements—it is enacted that any ecclesiastical corporations, aggregate or sole, excepting as mentioned in the act, may, with consent of the *ecclesiastical commissioners for England* (q. v.)—to which, where the lessor is

incumbent of a benefice, the consent of the patron also must be added—demise by deed the corporate lands or houses for any term not exceeding 99 years, to take effect in possession and not in reversion, to any person willing to improve or repair the same; provided that on the grant of such leases, a small rent may be reserved during the six first years, with an increased rent afterwards; but no such lease is to comprise the usual house of residence, its out-buildings, or pleasure-grounds. The act contains other regulations, and it declares generally that it is made without prejudice to any right that ecclesiastical persons have under the former law to grant or lease, whether by renewal or otherwise.

In the Scotch law, the term building lease is applied to the case of proprietors of entailed estates, who, in order to encourage the building of villages and houses upon property so settled, are to have it in their power to grant leases of land for the purpose of building, for any number of years not exceeding 99 years. See this matter regulated by the 10 Geo. III. c. 51. By the 3 and 4 Vict. c. 48, proprietors of entailed estates in Scotland may feu or lease on long leases ground for the building of churches and schools, and for the dwelling-houses and gardens for the ministers and masters of the same, and also for burying-ground and play-ground attached to such churches and schools. See LEASE, LEASEHOLD, and GROUND-RENT.

BUILDING SOCIETIES. See BENEFIT SOCIETIES.

BUILDING STONE. The chemical composition of B. S. varies. The majority of kinds are more or less silicious, and are designated sandstones. These consist of particles of sand, united together by the force of cohesion, and by a small proportion of a natural cement; in some cases, ferruginous, consisting of a compound of iron; and in other instances, calcareous, composed of carbonate of lime. Igneous rocks furnish very durable B. S., though in general the hardness of the materials renders them so difficult to work, that they are seldom resorted to where softer stones can be procured. Thus, granite is largely employed in the construction of the houses in Aberdeen, in the erection of bridges, in the paving of streets, and wherever great durability is required. Greenstone and basalt are also occasionally used. The B. S. employed in the new houses of parliament is a magnesian limestone, or a double carbonate of lime and magnesia, which is very close and compact in texture, and is soft enough to be easily cut with the chisel; unhappily it has not proved firm enough to resist weathering, having already shown signs of decay. The other forms of carbonate of lime exhibit considerable durability. Near Bath and in the isle of Portland, an oolitic limestone is quarried, which is easily cut, and stands well.

A very convenient and accurate way of determining the durability of a B. S.—in other words, its power of resisting the effects of frost and other atmospheric agencies—is to place a small block in a cold saturated solution of sulphate of soda; raise to the boiling-point, so as to expel air from cavities in the stone, which then become filled with the solution; then allow to cool, and suspend the block of B. S. in air. Every now and then, it is dipped into the solution, and subsequently air-dried. The result is, that the sulphate of soda crystallizes on the outside and partially in the interior of the block, and in this respect acts as water does when it is frozen during winter; and if the B. S. be porous, and liable to decay by natural agencies, it gradually breaks up, and particles scale off. The amount of this corrosion can be determined by weighing the detached portions. Some building stones contain iron pyrites in little nodules diffused here and there throughout the mass, and such become discolored from the pyrites being decomposed by atmospheric influence, and the brownish-red oxide of iron (rust) is left as a stain on the surface of the block. The liability to decay or to discoloration in a B. S. may be arrested to a great extent by coating the outer surface with boiled linseed-oil, which communicates a dark appearance to the stone, but prevents oxygen or moisture from gaining access to the block. Ordinary oil-paint is employed for the same purpose. For the preservation of B. S. from decay by means of various solutions, see STONE, PRESERVATION OF.

BUITENZORG, a t. in Java, 66 m. s. of Batavia, with which it has railway communication. It is in a fine situation, 800 ft. above the sea, and is a favorite residence for Batavia's rich men. The country palace of the governor-general is one of the chief buildings, and there are a mansion for the regent, a garrison church, and mosques. The botanical gardens, laid out in 1817, are among the best in the world. In the neighborhood is a sacred forest held in great veneration by the natives.

BUJALANCE, a city of Andalusia, Spain, about 20 m. e. of Cordova. It is surrounded by a moat and a wall flanked with old towers, has an old Arab castle, and manufactures of woollens, glass, and pottery, exports of agricultural produce, and an important annual cattle-fair. Pop. about 9000.

BUKKUM WOOD. See BRAZIL WOOD and SAPPAN WOOD.

BUK'KUB, a fortified island of the Indus, in Sinde, in lat. 27° 39' n., and long. 68° 56' e. It is 400 yards from Roree, on the left bank, and 100 from Sukkur on the right. In the ordinary state of low water, the western and eastern arms of the river are respectively 15 ft. and 30 ft. deep. In particularly dry seasons, however, the former has been known to disappear altogether, and even the latter is said to have occasionally been

fordable. In 1839, a British force, on its march to Afghanistan, made a stepping-stone, as it were, of B. in crossing the Indus, having joined it to either mainland by a bridge of boats. B. is no longer of any military value against a civilized assailant, commanded, as it is, on both sides by higher grounds. It is composed of limestone, being 800 yards long, and 300 broad, and rising 80 ft. from the average level of the stream.

BUK KUR, a t. of Sinde, about 3 m. e. from the Indus, on a water-course derived from the great river, and flowing parallel with it, 190 m. w. of Lahore. It is situated in a fertile district, and carries on an active commerce. Pop. 8000.

BUKOWINA, a duchy in the Cis-Leithan (non-Hungarian) section of the Austrian empire, on the Russian frontier; area, 4000 sq.m.; pop. '69, 513,404 (of whom 41 per cent are Ruthenian Slavs and 38 are Moldavians). It is traversed by offsets of the Carpathians, gives rises to many rivers, and abounds in wood, along with considerable mineral riches. Wood-cutting and mining afford occupation for a great number of the inhabitants. Large numbers of cattle are reared, and also excellent horses. B., till the end of the 15th c., belonged to Transylvania, when it came under the dominion of the Turks, by whom it was ceded to Austria in 1777. Czernowitz is the chief town.

BULACAN, a t. of Luzon, Philippines, at the head of the bay of Manila, about 20 m. n.w. of the city of that name. B. is chiefly composed of wooden houses, but has spacious streets, manufactures of silken mats and other fabrics, and large sugar-boiling establishments. Pop. between 9000 and 10,000.

BULAMA, the most easterly of the Bissagos islands off the w. coast of Africa; 11° 34' n., 15° 33' w.; 18 by 9 m.; fertile and heavy wooded, but insalubrious. There is a good harbor. An English colony was sent here in 1792, but nearly all soon fell victims to the climate.

BULAU, or **TIKUS**, *Gymnura rafflesii*, vig., an animal in Sumatra, of the mole family resembling the opossum. The body is 12 to 14 in. and the tail 9 or 10 in. long. It is about 5 in. high at the shoulder; color black and white, with a black stripe over each eye; the fur mixed with long bristly hairs, and tail nearly naked. It feeds on insects, and secretes a strong odor of musk.

BULB, in botany, a subterranean bud covered with imbricated scales, having at their base a flattened disk, which represents the proper stem of the plant, and from which the roots proceed downwards, whilst from the midst of the scales an annual herbaceous stem and leaves are sent up. The scales are regarded as modified leaves, and sometimes are all fleshy, as in the lily; sometimes the outer ones are membranous, as in the onion, in which case the B. is said to be *tunicated*. The B. is popularly but erroneously regarded as the root or part of the root of the plant, and plants in which it is found are very generally described as *bulbous-rooted*. New buds are formed in the axils of its scales, which grow at the expense of the parent B., and gradually destroy it. In some plants, as the tiger-lily and some species of allium, leaf-buds (*bulbils* or *bulblets*) are developed on the stem above-ground, which spontaneously separate and serve for the propagation of the plant, and which are entirely of the nature of bulbs, being formed of thickened scales, sometimes so closely united as to form a solid mass. The **CORM** (q.v.) was formerly regarded as a kind of B., and described as a solid B., but its structure is essentially different, although both it and the **TUBER** (q.v.) may be included in the description which Linnæus has given of the B. with reference to the purpose which it serves as "the winter-quarters of the plant." Many bulbs, if removed from the ground during the period when the vegetation of the plant is most dormant, may be kept in a dry place without injury for a considerable time, even for years. Bulbs serve also for the preservation of plants in periods of drought, and are particularly frequent in those which delight in sandy soils. The abundance of "bulbous-rooted" plants is a remarkable characteristic of the flora of the cape of Good Hope. "Bulbous-rooted" plants are very often distinguished by the beauty of their flowers, and many of them are among the most esteemed ornaments of gardens, greenhouses, and stoves. The bulbs of tulips, hyacinths, and other favorite flowers are important articles of trade. Some bulbs, as that of the onion, are valuable as articles of food; others, as that of the squill, from their medicinal properties.

BUL'BUL, an Armenian name for the nightingale, which has found its way into English poetry chiefly through the patronage of lord Byron. But the same name is given in India to a very different bird, *pycnonotus hæmorrhous*, belonging to the great tribe of *dentirostres*, and formerly ranked among the thrushes, to which it is pretty nearly allied. It is a little bird of brilliant plumage, and the male has a crest or tuft on its head. It is remarkable for its pugnacity; the Singhalese consider it the most *game* of all birds.

BULGA'RIA, an autonomous principality, tributary to Turkey, which till 1878 constituted the Turkish vilayet of the Danube (Tuna). B. is bounded to the n. by the Danube and the Dobrudscha, now Roumanian; on the e. it has the Black sea; on the s. the Balkan range; and on the w., Servia and Roumelia. There are altogether between 2,000,000 and 3,000,000 of the Bulgarian race; of the 2,000,000 souls who form the population of the new state of B., the great majority are Bulgarians. The area of B. is about 33,000

sq. miles. The country slopes terrace-like from s. to n., and from the w. to the e., acquiring a plain-like character before reaching the Black sea. The rivers are rapid and tributary to the Danube. The soil in some parts is very fertile, producing great abundance of corn; in others, it does not yield sufficient for the consumption. There is excellent pasture-land, and the lower terraces are richly wooded. The exports include horned cattle, sheep, corn, wine, iron, wood, honey, wax; and otto of roses is an important article. The inhabitants are hard-working, hospitable, and fairly intelligent, but suspicious and greedy; their faith is that of the Greek church. The prince, freely elected by the people, must be confirmed by the porte with the assent of the powers. The first choice of the Bulgarians was the prince of Battenberg, a cousin of the grand-duke of Hesse, who in 1879 became Alexander I. of Bulgaria. The government is Christian, and there is a national militia. The Berlin congress decided that the military importance of B. should meanwhile be decreased by the demolition of all its fortresses.

The earliest known inhabitants of B. were the Mœsians, who contended long against the Romans, and allied themselves with Gothic and Slavonic tribes against the Greek empire. Anastasius, the Greek emperor, in 507, built an extensive wall to defend his territories from Mœsian invaders. In the 7th c., the Bulgarians, a people of Finnish origin, whose original seat was the banks of the Volga, conquered the Mœsians, and established the kingdom of Bulgaria; they soon lost their own language and customs, and became assimilated to the other Slavonic inhabitants. After being tributary to the Greek emperors, and contending for some time against Hungary, B. became subject to the Porte in 1392; but the frightful oppression of despotic and sanguinary pashas has not, even to the present day, robbed the inhabitants of a distinctively national life and love of freedom. In April, 1876, an insurrection broke prematurely out in B., and was quenched in blood, the bashi-bazouks or Turkish irregulars committing savage excesses. The atrocities in B., taken in connection with the Servian war and the condition of other Christian provinces of Turkey, led to diplomatic intervention; and in December a conference met at Constantinople, but without result. The war of 1877-78, between Russia and Turkey, followed. The congress of Berlin, which revised the treaty of San Stefano, declined to sanction the erection of a Bulgarian principality extending from the Danube to the Ægean. But it constituted an autonomous, though tributary, Bulgaria n. of the Balkans, and to the mainly Bulgarian province s. of them, that of eastern Roumelia (q. v.), it granted administrative autonomy.

The BULGARIAN LANGUAGE is divided into two dialects—Old Bulgarian and New Bulgarian; the former, the richest of the Slavonic dialects; the latter remarkable for its store of popular songs.

BULGARIAN LANGUAGE, the richest of the old Slavic tongues, used by the Græco-Slavic church, and the chief medium of religious writings in that region. After the fall of the Bulgarian kingdom, about 1500 A. D., the language became mixed with neighboring dialects and lost its purity. In the older literature are found translations of the Bible made in the 10th century. The literature of the present time is of small account, being only such as is found in elementary and doctrinal works. Grammars and dictionaries have been published since 1835, and a New Testament was issued in 1840 for the British and foreign Bible society. The language lives in many native songs, but is not as yet printed anywhere in the country.

BULGARIN, THADDEUS, a Russian author, was b. in Lithuania, 1789; fought in the campaign against France, but afterwards served under Napoleon. On Napoleon's fall, he devoted himself to literature. He wrote both in Polish and Russian; and ultimately settling in St. Petersburg, became a popular author. He composed several romances—of which *Demetrius* and *Mazepa* are the best—and published different periodicals. His large work, *Russia in its Historical, Statistical, Geographical, and Literary Aspect*, was published at Riga, 1839-41. He died in 1859.

BULGARUS, the most celebrated of the famous "four doctors" of the law school of Bologna. He was a native of that city, and was regarded as the Chrysostom of the gloss writers. He lived to a great age, becoming childless before his death in 1166. B. was one of the most trusted advisers of the emperor Frederick I. The commentary *De Regulis Juris* is his most celebrated work.

BULIMUS, a genus of land snails most numerous in the moist parts of Brazil. *Bulimus oratus*, sometimes 6 in. long, is sold in the Rio Janeiro markets. It has an oblong turreted shell of unequal margin, and lays large eggs nearly an inch long, resembling those of birds, but very brittle, which it protects by a covering of dried leaves. There are many fossil species. The species of temperate regions are small.

BULKHEADS, in a ship, are the partitions between the several portions of the interior; whether to separate it into rooms, or as a safeguard in case of wreck.

Water-tight B. are among the improvements in modern ship-building; they are iron walls running athwart the hold, as a means of dividing it into several portions; the interior is thus cut off into cells, each water-tight in reference to its neighbors. When such a ship is leaking in any one of the compartments, there is thus a chance that the others may be kept dry until the damage is repaired. In iron steamships the water-tight B. are generally placed transversely, but there are frequently longitudinal water-

tight divisions also. The number and disposition of the compartments depends on the ship-owner and the ship-builder; but it is now the common practice to place the engines and boilers in water-tight sections, and experience has proved the special value of a collision-bulkhead in the bow. In iron-clads of the navy, such as the *Hercules* and the *Bellerophon*, which have an inner bottom, there are nine transverse water-tight bulkheads. In the torpedo-ram *Polyphemus*, the principle of having numerous water-tight compartments in the lower part of the vessel has been carried as far as possible.

BULKLEY, PETER, 1583-1659; b. England; the earliest minister in Concord, Mass. He was his father's successor at Woodhull, England, but was removed for non-conformity, and in 1635, with a number of other emigrants, founded the Concord settlement. He wrote several Latin poems, and a work called *The Gospel Covenant Opened*, published in England. His son Edward succeeded him in the ministry.

BULL (Lat. *bulia*, primarily, anything round or swelling) was originally the name of the capsule of the seal appended to letters from emperors or from the pope. Afterwards, the word was applied to the seal, and next to the document itself, as in the case of the celebrated golden bull of the emperor Charles IV., which was so named from the golden capsule appended to imperial letters and other important documents by the Byzantine and Frank emperors as early as the 9th century. They are issued by the apostolic chancellor, and are dated "from the day of incarnation," whereas briefs are always dated "from the day of the nativity." The name is now applied exclusively to letters or documents issued in the name of the pope. In cases of granting favors, etc., the seal is appended to the open letter by a yellow or red band of silk; but in the administration of justice, a gray hempen band is used. All bulls, excepting those addressed to the united Greek Christians, are written in Latin with Gothic letters, and on the rough side of the parchment. See **BRIEF**. All bear the name and title of the pope—for example, *Gregorius Episcopus Servus Servorum Dei*, etc., is prefixed; then follows a general introduction, of which the initial words are used to give a distinct name to the B., as in the examples: the B. *Ersurge Domine*, issued by pope Leo X. against Luther in 1520; the B. *In Cæna Domini*, the celebrated B. against heretics, often reissued since 1536; the famous *Unigenitus*, or B. against Quesnel's writings, 1713; the *Dominus ac Redemptor Noster*, or B. for the abolition of the order of Jesuits; the *Ecclesia Christi*, or the B. which completed the *concordat* with France in 1801; the *De Salute Animarum*, or the B. for the regulation of the Catholic church in Prussia. To every B., the leaden seal of the church is appended, bearing on the obverse the arms of the pope, and on the reverse his name. Bulls issued during the interim between the election and consecration of a pope have no armorial bearings on the seal. A *bullarium* is a collection of papal bulls, as the *Bullarium Magnum Romanum a Leone Magno ad Benedictum XIII.* (19 vols., Luxembourg, 1727-58), the *B. Romanum* (28 vols., Rome, 1737-44), and the *B. Benedicti XIV.* (Mechlin, 1826-27), and more recently, the continuation of the *Bullarium Romanum Magnum* by Barberini (Vienna, 1835).—From the same mediæval Latin word *bulia* is derived the word *bulletin* (Ital. *bulletino*), commonly applied to dispatches from generals, reports of the health of royal personages, and on the continent, at least, to other brief authenticated documents, such as those of scientific societies, the best known of which are the bulletins of the St. Petersburg and Belgic academies. It is, moreover, used as a title for periodicals, and, in France, also designates the slips of paper on which electors write their votes.

BULL. See *Ox, ante*.

BULL, GEORGE, D.D., a learned prelate and theological writer, b. at Wells, Gloucestershire, England, Mar. 25, 1634; studied at Oxford, whence he retired in 1649, having refused to take the commonwealth oath imposed by the parliament. Receiving holy orders, his first charge was the parish of St. George's, Bristol. In 1658, he obtained the rectory of Suddington St. Mary's, near that city; and in 1662, was presented to the vicarage of Suddington St. Peter's. In 1669, he published his *Harmonia Apostolica*, the object of which was to reconcile the apostles Paul and James on the subject of justification. This work occasioned considerable controversy among divines, and in answer, B. published his *Examen Censura*, and *Apologia pro Harmonia*. In 1678, he was presented to a prebend in Gloucester cathedral, and made rector of Avening, Gloucestershire. In 1679, he was installed archdeacon of Llandaff, and received the degree of D.D. from Oxford University. In 1685, he published his *Defensio Fidei Nicenæ*, against the Arians and Socinians, Tritheists and Sabellians; and in 1694, his *Judicium Ecclesie Catholice*, for which the thanks of the whole French clergy were sent to him through the celebrated Bossuet. His last work was his *Primitive and Apostolical Tradition*, etc. He was consecrated bishop of St. Davids in 1705, and died Feb. 17, 1709.

BULL, JOHN, 1563-1628; an English organist and composer. He was appointed organist in the queen's chapel in 1591, and next year made doctor of music in Gresham college. Not understanding Latin, he was especially permitted to lecture in English. He visited the continent, and had many offers of honorable and lucrative positions, but declined all, returning to England to be organist to James I. On another visit to the continent he became organist to the cathedral in Antwerp, where he died. The claim that he composed the English national anthem has not been sustained.

BULL, JOHN, a familiar synonym for the English people. Its origin is attributed to dean Swift, but Arbuthnot first gave it literary currency in his *History of John Bull* (1712), a political allegory intended to satirize the duke of Marlborough, and to increase feeling against the war with France. In art John Bull is well known as a burly country squire, impetuous, honest, narrow-minded, dogmatic, and easily imposed upon.

BULL, OLE BORNEMANN, a famous violinist, was b. 5th Feb., 1810, at Bergen, in Norway. His father, it is said, attempted to coerce him into the study of theology, and would not permit a musical instrument about the house. This foolish treatment only gave a more decisive character to the peculiar genius of the boy. At the age of 18 he was placed at the university of Christiania, from which he is said to have been expelled for taking temporary charge of the orchestra at one of the theaters. In 1829, he went to Cassel, in Germany, to study under Spohr, but was so coldly received that he betook himself to the study of law at Göttingen. He was subsequently at Minden, whence, in consequence of a duel, he fled to Paris in 1831. An unsuccessful attempt to drown himself in the Seine was the turning-point in his life. He thereafter acquired the patronage of a lady of rank, and rapidly rose to fame as a violinist. His style of playing was like that of Paganini. B., however, wished to excel his model in originality, and in triumphing over the most extraordinary difficulties; but it was impossible for him to follow the flight of the great Italian, in whose brain some capricious musical demon seemed to lurk. Nevertheless, he was received in Italy with prodigious enthusiasm—Malibran herself embracing him on the stage at Naples. In 1836, he visited England, Scotland, and Ireland, and subsequently traveled in a professional capacity through Belgium, Holland, Russia, and Germany. After a long repose, he sailed for America, whence he returned in 1850; but he again went out, and was so successful, that he thought of retiring from public life. He purchased in Pennsylvania 125,000 acres of excellent ground, and founded a colony of Scandinavians. This turned out a complete failure, and B. was again compelled to resume his violin. He visited Europe, returning with a fortune to the United States in 1869; he revisited Europe in 1875 and 1879.

BULL, OLE BORNEMANN (*ante*), d. 1880; came to New York the first time in 1843. He became attached to this country, taking a great interest in its republican form of government. Returning to Norway, his American ideas offended the government, resulting in many lawsuits and the dissipation of his wealth. His wife, a Parisian lady, died; and in 1852, after an absence of 7 years, he came again to this country. Here he put into practice a scheme long contemplated, which, like most of his business speculations, resulted disastrously. He purchased 120,000 acres of land in Pennsylvania, and attempted to found there a colony of his countrymen. He designed a castle for his permanent home, and erected it on the summit of a mountain, from which there was a commanding view. Before the castle was completed the colonists grew discontented, and about the same time he learned that the title to the land which he had purchased was worthless. Ole Bull relinquished everything, and again had recourse to his violin to repair his bankrupt fortunes. All that remains as a reminder of his grand scheme is the village of Oleana, named after him, which clusters around the base of the mountain capped by the once lordly castle known to this day as "Ole Bull's Folly." After a profitable European tour, he returned to this country; and has made his home since 1869 in Cambridge, Mass. In 1870, he made a happy marriage with a young Minnesota lady. His form was tall and erect even to old age. He was gifted with a remarkable memory and with social qualities by which he made and retained many friends. On his seventieth birthday, which occurred in Feb., 1880, a surprise party was given in his honor at his home in Cambridge, at which many literary celebrities of the vicinity were present. He was then, to all appearances, strong and healthy. Early in the summer he sailed for his summer residence in Norway, where he died.

BULLA, a genus of mollusca, which in the older systems, founded upon characters taken from the shell alone, contained a heterogeneous assemblage of species essentially very different. Some of those having been removed to other orders, according to their organization, the genus *bulla*, and the family *bullidae*, of which it is the type, are placed in the order *tectibranchiata* of Cuvier, an order of the class *gasteropoda* (q.v.), and of that section of it called *monœcia*, having the male and female organs of sex combined in the same individual. The *bullidae* have a convoluted and generally thin shell, which serves as a covering and protection for the gills, and which in some of them is large enough to form a retreat for the entire animal, in others is itself enveloped in the mantle. This shell forms a sort of transition link between the flat calcareous plate inclosed in the mantles of the *aplysia* or sea-hares—to which B. is nearly allied—and the spiral shell of snails and other such conchiferous mollusks. The mouth of the shell is large, extending the whole length of the shell, widening towards one end, the lip acute. The gizzard of the *bullidae* is very muscular; and among its thick coats, in many species, are found calcareous bony plates, which being moved against each other by its muscles, serve to grind down the food. All the species are marine, some are found on the British coast. Some, from their form and fragility, are popularly called BUBBLE SHELLS, as the British *bulla hydatis*.

BULLACE, *Prunus insititia*, a shrub or small tree, larger and much less spiny than the sloe, but very closely allied to it, as it is also to the plum, so that many botanists

regard them all as one species, an opinion much confirmed by the circumstance that the varieties pass into each other by imperceptible gradations. The B. may be regarded as a form intermediate between the plum and the sloe. Its leaves, however, are generally broader in proportion to their length than those of either of these, and its fruit-stalks more frequently in pairs; it differs also from both of them in its downy fruit-stalks, and in having the under side of its leaves permanently downy. The flowers are rather larger than even those of the plum; the fruit is larger than the sloe, generally globose, and, although it partakes in some degree both of the acidity and the roughness of the sloe, it is not unpleasant, especially after having been mellowed by frosts, and makes excellent pies or tarts. "A bullace-pie is a standing dish at the harvest-home supper in the south of England, only it requires rather more sugar than the housewife is always willing to allow." The B. is common in hedges, coppices, and banks in England, and in many parts of Europe. It is rare in Scotland.

BULLE are collections of serous fluids of considerable size, situated immediately beneath the cuticle, and rising from the true skin. They differ from vesicles only in size; and no very definite line can be drawn between a large vesicle and a small bulla. They usually vary in diameter from a quarter of an inch to two inches. They may be followed by crusts or by ulcerations. They constitute a special order of skin-diseases, which includes pemphigus and rupia (q. v.).

BULLAS, a t. of Spain, in the province of Murcia, and 26 m. w.n.w. of the town of Murcia. It is situated on a hill, 1840 ft. above the sea. The streets are steep and unpaved. B. has manufactures of linen and hempen fabrics, earthenware, and brandy, and a considerable trade in manufactured goods and grain. Pop. 5145.

BULL-BAITING, a barbarous sport, once very popular in England, and in which all classes of society equally delighted, but now, through the progress of civilization, almost entirely confined to the lowest, and rare even among them. It consists in causing a bull to be attacked by dogs; and, in order that the bull might be made as furious as possible, his nose was sometimes blown full of beaten pepper before he was turned loose. Another form of this sport was to fasten the bull to a stake, by a rope of some yards long, and to send bull-dogs against him, one at a time, which were trained to seize him by the nose, and, when this was accomplished, it was called *pinning* the bull. But no small part of the enjoyment of the spectators was derived from the success with which the attacks of the dogs were met by the bull lowering his head to the ground, and receiving them on his horns, often tossing them to a great distance. In some places, bull-baiting took place regularly as a sort of annual festival, and funds were sometimes left to provide for it. King James I. of England greatly delighted in this sport. When the late emperor Nicholas of Russia visited England, before his accession to the empire, he was present at a boxing-match and a bull-baiting, which were got up to show him English tastes.

An equally barbarous sport, termed *bull-running*, was formerly practiced at Stamford and Tutbury, where men and women took the place of dogs, maddened the bull with hideous noise, and then pursued it with "bull-clubs," till the unfortunate animal expired beneath the blows of its brutal assailants.

BULL-DOG, a kind of dog which is regarded as peculiarly English, but concerning which it is doubted whether it has existed as a distinct race, at least from the Roman era, or has more recently sprung up, as a variety of the mastiff, or a cross between the mastiff and some other breed. Buffon, indeed, represents the bull-dog as the parent race, and the mastiff as derived from it, but this opinion is generally rejected as erroneous. The bull-dog has been regarded as a distinct species by some naturalists, and named *canis Anglicus*, *C. laniarius*, etc. It is much smaller than the mastiff, but is very strong and muscular. The breadth of muzzle is greater than in the mastiff, and the head is very large, almost appearing as of disproportionate size to the body. "The forehead sinks between the eyes, and the line of the nose rises again at a considerable angle; the lower jaw projects beyond the upper, often showing the teeth, which altogether, with the frequent redness about the eyelids, produces a most forbidding aspect; the ears are partially drooping, unless the terrier blood is crossed in the animal, and the tail is carried high." The hair is short, and the tail taper, and not bushy. The color may be ochry or reddish buff, brindled, fawn, or white, the last being preferred, and should be whole or unmixed, though dogs of two colors are exceedingly common. The bull-dog used seldom to be seen except in the company of persons who delight in dog-fighting and other barbarous sports, but now has sometimes more reputable patrons. It was formerly much employed in bull-baiting, from which it derives its name. It is chiefly remarkable for its savage ferocity, and the pertinacity with which it retains its hold, as if its jaws were locked, and it could not let go. It will hang to the jaw or nose of a bull, although lifted from the ground. Col. Hamilton Smith says he has seen one "pinning an American bison, and holding his nose down, till the animal gradually brought forward its hind feet, and, crushing the dog to death, tore his muzzle out of the fangs, most dreadfully mangled." The bull-dog is also bold enough to attack any animal, however superior in size and strength.

The **BULL-TERRIER** is a cross between the bull-dog and the terrier. It is smaller than the bull-dog, more lively and docile, and equally courageous. The ears are always

pointed; the best color is white, with some black about the head. It is unrivaled in rat-catching. It is a great favorite as the companion of young men.

BULLER, CHARLES, b. in Calcutta in 1806, was a gentleman whose name falls to be recorded more on account of the hopes which his death in 1848 disappointed, than for the performances of his life. He was educated at Harrow and Cambridge, at both of which he distinguished himself, and for a time studied in Edinburgh, where he had Mr. Thomas Carlyle for one of his tutors. He was called to the English bar in 1830, and entering parliament before the reform bill, continued a member of the lower house till his death. He was still but a rising man when he died. In politics, a philosophical radical, he occupied successively the posts of judge-advocate general and president of the poor-law commission under whig governments. The interest taken in his career, and his popularity, were, it would seem, largely owing to his amiability and accomplishments for society.

BULLET is the leaden projectile discharged from a musket, fowling-piece, pistol, or similar weapon. When the smooth-bore muskets alone were used by British infantry, the bullets were made by casting. Molten lead was poured into molds; and the molds were dipped in cold water, to hasten the solidification of the lead. The molds were cooled after every few times of using; and the lead was heated only just to the degree for maintaining fluidity. Bullets are now, however, made more expeditiously, and more truly spherical in form, by compressing machines, one form of which has been invented by Mr. George Napier. The lead is first fashioned into a rod about a yard long, by five or six eighths of an inch thick; this rod is passed between rollers to condense it; then between other rollers to press it into a row of nearly globular pieces; then a spherical die gives the proper form to each of these pieces; and, lastly, a treadle-worked punch separates them into bullets. With one of these machines and two dies, nine boys can make 40,000 bullets in a day.

Spherical bullets for the old muskets, carbines, and pistols varied from 14 to 20 to the pound, and from 0.60 to 0.68 of an inch in diameter. There is a particular ratio, depending on the specific gravity of lead, by which the number to the pound will give the diameter, or *vice versa*.

Such bullets are, however, becoming every year less and less used in the army, being superseded by other forms better suited for rifles. These forms are singularly numerous. Robins' B. was egg-shaped, with the center of gravity at the larger end; Beaufoy's was ovoid, with a hemispherical cavity at one end; Manton's was a spherical ball put into a wooden cup, with projections on the exterior; Greener's was oval, with a plug of mixed metal driven into a hole barely large enough for it; Norton's, Delvigne's, Minié's and others, are, or were, of various elongated shapes, mostly with some kind of plug, which, driven into the lead by the force of the explosion, causes it to fill up the grooves in the rifling of the barrel. This expanding or dilating action has been claimed by many inventors; but the government, in 1857, awarded Mr. Greener £1000, as the person who had practically solved the difficulty as far back as 1836. The bullets for the Enfield rifles are now made with extraordinary speed, by machinery of beautiful construction. The machine draws in a coil of leaden rod, unwinds it, cuts it to the required length, stamps out the bullets with steel dies, drops them into boxes, and conveys them away. Each machine, with its four dies, makes 7000 bullets per hour; and four such machines, in an easy day's work, turn out 300,000 bullets. So nearly are the machines automatic, that one man can attend them all. Other machines, attended by children, produce an equal number of little boxwood plugs for filling the cavity at the hinder end of the bullet. The differences between various bullets of modern invention are further noticed under CARTRIDGE and BREECH-LOADING ARMS AND NEEDLE-GUNS.

BULLET-TREE, or BULLY-TREE, a tree found in Guiana, and valued for its wood, which is solid, heavy, close-grained, and durable, and also for its fruit, which is a drupe about the size of a cherry, and very delicious. It is supposed to belong to the genus *mimusops* (natural order *sapotaceæ*, q. v.).

BULLETIN. See BULL.

BULL-FIGHT. Combats of men with bulls, for the entertainment of the public, were common in Greece, particularly in Thessaly, and in Rome under the emperors, though in later times they were forbidden both by emperors and popes. They are still a favorite pastime in Spain and Mexico. In Spain, they were abolished by Charles IV.; but Joseph, Napoleon's brother, re-established them, out of policy, the mass of the Spanish population being passionately fond of the sport. The most magnificent bull-fights were at one time instituted by the monarchs themselves; at present, both in the capital and in the larger towns of Spain, they are held either as private speculations, or for the benefit of public institutions. In Madrid, the bull-fighting season commences in April, and lasts until November. During that time, there is at least one afternoon in every week devoted to the sport. The proceeds go to the funds of the general hospital. The fights take place in a kind of circus, called the *Plaza de Toros*, round which the seats rise one above another, like the steps of a stair, with a tier of boxes over them. The *Plaza* is capable of containing from 10,000 to 12,000 people, who pay a high price of admission, considering the rate of wages in Spain; and all go attired

in their best to the spectacle. The best Andalusian bulls are bred at Utrera, the best Castilian ones on the Jarama, near Aranjuez. The latter are the breed usually chosen for fight in Madrid. They are fiercer and more active, but inferior in strength to British animals. The horses engaged in the conflicts are worthless brutes, fit only for the knacker. The men employed in the fight are generally those who have been bred to it as a profession, but occasionally amateurs may take part in it. The bull-fight has been described as a tragedy in three acts. The principal performers in the first are the *picadores*; in the second, the *chulos* are the only actors; the third and last act devolves solely on the *matador*. The *picadores* are all mounted, dressed like Spanish knights of the olden time, and armed with a lance; they take up their position in the middle of the circus, opposite the bull-stalls. The *chulos*, who are on foot, are gay with ribbons, and wear very bright-colored cloaks; they distribute themselves in the space between the barriers. The *matador*, or chief combatant, is also on foot. He is handsomely dressed, and holds in the right hand a naked sword, in the left the *muleta*, a small stick, with a piece of scarlet-colored silk attached. On a sign given by the chief magistrate, a bull is let out from the stalls; the *picadores* stand ready in the arena waiting his charge. With a brave bull, they find all their skill requisite in acting on the defensive; with a cowardly one, they act on the offensive; and should their stabs be ineffectual in rousing the animal to the requisite fury, the poor beast is hooted by the crowd, and ultimately stabbed ingloriously in the spine. Whenever a horse is wounded, the rider betakes himself to flight; and when either the above casualty happens, or a *picador* is thrown, the *chulos* rush in, and attract the bull by their cloaks, saving themselves, if need be, by leaping over the palisade which incloses the circus. At the same time, another *picador* calls off the bull's attention to himself by shouting. When the bull begins to flag, the *picadores* are succeeded by the *chulos*, who bring with them the *banderillas*—i.e., barbed darts about two feet long, ornamented with colored paper flags, which they stick into the neck of the animal. Sometimes these darts have crackers attached to them, the explosion of which makes the bull furious. The *matador* now enters alone to complete the tragic business. As soon as the bull's eye catches the *muleta*, he generally rushes blindly at it; and then the *matador*, if he is well skilled, dexterously plunges the sword "between the left shoulder and the blade," and the animal drops dead at his feet. The victorious *matador* is greeted with acclamations, and not less so the bull, should he wound or even kill the *matador*, in which case, another *matador* steps forth into the arena; but human life is rarely sacrificed. Eight or ten bulls are often dispatched in a single day; twenty minutes being about the time usually taken to slay one.

In Madrid, in June, 1833, 99 bulls were killed in the course of a single week. Bull-fighters are regarded as the lowest class in Spain. They are very ignorant and superstitious; and those who are killed on the spot and die without confession, are denied burial rites.

BULL-FINCH, *Pyrrhula vulgaris*, a bird of the great family of *fringillidæ* (q.v.), a little larger than the common linnæ, and of a genus closely allied to the grossbeaks and crossbills. The genus is particularly characterized by the short, thick, rounded bill, of which the sides are inflated and bulging, and the tip of the upper mandible overhangs that of the lower one. The bull-finch is a bird of very soft and dense plumage, of a delicate bluish-gray color above, the under parts of a bright tile-red, the crown of the head and the beak jet black, which color also appears in the greater wing and tail coverts, in the quills, and in the tail-feathers; the wings are crossed by a conspicuous white bar. The colors of the female are less bright than those of the male. The tail of the bull-finch is almost even. This bird is not unfrequent in England, Ireland, and the s. of Scotland; and is found in most parts of Europe, from the s. of Norway to the Mediterranean, extending eastward throughout Asia, even to Japan. It frequents woods and gardens, builds its nest in trees or bushes a few feet from the ground, feeds chiefly on seeds and berries in winter, and in spring is excessively destructive to the buds of fruit-trees in those localities in which it is abundant, selecting the flower-buds, and apparently finding them the most palatable of all food. Selby says: "I have known a pair of these birds to strip a considerable sized plum-tree of every bud in the space of two days." On this account, gardeners are sometimes compelled to wage war against the bull-finch.

The song of this bird, in a wild state, is very simple, and has no particular quality to recommend it; but it is remarkably susceptible of improvement by education; and trained bull-finches of superior acquirements are sold at a very considerable price. Some of these birds learn to whistle an air very accurately, and with a power and variety of intonation far exceeding their natural song. The ability to whistle several airs well, is rare. The training of these birds is a work both of time and trouble: it is chiefly carried on in Germany. Not less than nine months of training are requisite: it begins when the bird is a mere nestling, and must be carefully continued till after the first moulting; for it is a curious circumstance, that all which has been previously acquired is very apt to be lost at that time, or is afterwards so imperfectly remembered that the bird is of little value. The bull-finch is capable of very strong attachment to those who feed and caress it, and often becomes so thoroughly domesticated as to exhibit no desire for

liberty.—Curious variations of plumage are sometimes observed in it.—Other species of the genus *pyrrhula* are known, natives of different parts of the world; and in this genus some ornithologists include *corythus* of Cuvier, of which one species, the pine-finch (q.v.), or pine grosbeak, is a native of Britain.

BULL-FROG, *Rana pipiens*, a species of frog (q.v.) found in most parts of the United States and Canada, but chiefly abundant in the southern states. It is of a large size, 8 to 12 in. long, of an olive-green color, clouded with black. It receives its name from the remarkable loudness of its voice, which has been compared to the bellowing of a distant bull, and comes in as a hollow bass in the frog concerts which take place in the evening and all night long in marshy places in America. Its voice can be distinctly heard at a distance of 40 or 50 yards. It sits for hours during the day, basking in the sun, near the margin of a stream, into which it plunges with a great leap on the least appearance of danger. It does not confine itself to insect and molluscos food, like smaller frogs, but is said to be partial to young ducks, and to swallow them entire. Audubon says "its flesh is tender, white, and affords excellent eating," the hind legs, however, being the only part used for food. He adds that these parts make excellent bait for the larger cat-fish, and that he has generally used the gun for procuring them, loading with very small shot.

BULL, GOLDEN, applied to the decree of Charles IV. of Germany, published in 1356, to fix the laws for the election of emperors and regulate the number of electors. A similar edict by Andrew II. of Hungary (1222), for similar purposes bears the name.

BULLHEAD, **RIVER BULLHEAD**, or **MILLER'S THUMB**, *Cottus gobio*, a small fish, abundant in clear rivers and streams, in some parts of the British islands, throughout the greater part of Europe, and in the n. of Asia. It seldom exceeds 4 or 5 in. in length; is of a dark brown color on the upper parts, and white beneath; has rather large fins, with rays slightly produced into spines and prettily spotted; and in general appearance is not unlike the gurnards (q.v.). It is, however, generally regarded as a disagreeable object to the sight, on account of the great size and depressed form of its head, from which it derives its English names; the name, miller's thumb, alluding to the broad rounded form which the last joint of the thumb of a miller used to acquire in times when machinery was ruder than now, by its continual employment in testing the quality of the flour produced, and in turning it over on the fingers for inspection, that it might be known if the mill was doing its work well. The appearance of the B. is rendered still more unattractive by the entire absence of scales, a characteristic of the genus to which it belongs, the whole body and head being covered with a soft skin. Yet it is said to be of a very delicate flavor, and in some countries is much sought after as an article of food. Its flesh, when boiled, is reddish, like that of the salmon. Izaak Walton speaks of angling for the B., and in his pleasant quaint style describes the habits of the fish: "He does usually dwell and hide himself in holes, or amongst stones in clear water, and in very hot days will lie a long time very still, and sun himself, and will be easy to be seen upon any flat stone, or any gravel, at which time he will suffer an angler to put a hook baited with a small worm very near into his mouth, and he never refuses to bite, nor indeed to be caught, with the worst of anglers."—The other British species of the genus *cottus* (q.v.) are marine. The name B. is not usually given to any of them. A sea-fish of a nearly allied genus (*aspidophorus*) is sometimes called the **ARMED BULLHEAD**; it is also known as the Pogge (q.v.).—The river B. differs from the marine species of the same genus, in having only one short spine on each side of the head, on the *preoperculum*.

BULLHEAD (*ante*), a popular name applied to several species of fresh and salt water fish found in the eastern parts of America, and belonging to the genera *cottus* and *acanthocottus*. The common B., often called the "sculpin," is well known to anglers for its scarecrow form and colors. They are voracious, devouring small fish, crabs, decayed flesh, etc., and frightening away such fish as they cannot eat. They vary greatly in size, but are usually small, and seldom used for food.

BULLINGER, HENRY, the friend of Zwingli, and one of the chief reformers in Switzerland, was born at Bremgarten, in the canton of Aargau, July 18, 1504. He studied at Cologne, where he became acquainted with the writings of Luther; and during the year 1527, he attended the theological expositions of Zwingli, and went along with the latter to the religious conference held at Bern in 1528, the result of which was the reformation of the canton. In 1529, he married Anna Adlischwyler, formerly a nun, who bore him eleven children. By a powerful sermon which he preached at Bremgarten, on Whitsunday, 1529, B. induced his whole congregation to make a profession of Protestantism. In 1531, he was compelled by the Catholic party to flee from the canton, and went to Zurich, where, in the following year, he was appointed pastor of the principal church. In the controversy on the eucharist and the affairs of the Anabaptists, B. distinguished himself by his integrity and moderation; and in his house at Zurich several German theologians, compelled to leave their country, were hospitably sheltered. He took part in drawing up the first Helvetic confession at Basel, in 1536, and in establishing a close relation between the Swiss and Anglican churches. He died Sept. 17, 1575. His writings are numerous. The most important is a *History of the*

Reformation, which was first published at Zurich, 1838. His sermons have been translated into English. See the Lives of B. by Hess (1828) and Christoffel (1875).

BULLION usually means uncoined gold and silver, in bars or other masses; but in discussions on the currency, the term is frequently employed to signify the precious metals coined and uncoined. The origin of the word B. in its present sense, as well as that of the French *billon* (q. v.), and the corresponding Spanish *vellon*, seems to be as follows: B. originally meant the mint, where the alloy for the coinage was prepared, and the coin stamped (either from the Lat. *bullu*, a round boss or stud, or stamp; or from the verb *bullare*, to boil or bubble); and hence it came in England to signify the standard metal of which the coins are made. In France, where the kings debased the currency much more than ever took place in England, *billon*, the mint, came to signify the base mixture issued therefrom.

It is a question not yet satisfactorily settled, how far any great increase in the supply of B. has that effect in lessening the value of money, and consequently raising prices, which has always been very naturally attributed to it. It may indeed be maintained with some plausibility, that if B. were capable of being produced to such an extent beyond the actual demand for it as to glut the market, it would cease to be that general standard of money value which it has become, just because it is of all others the article which is steadiest in requiring a certain outlay of labor to produce it. Rises in prices have accompanied large supplies of gold, but they have also accompanied large supplies of other commodities indicative of a great increase in riches. It is certain that great increases in the supply of B. do not, as in the case of other goods, glut the market. For some years past, the supply of gold, owing to the new fields opened in America and Australia, has been quadrupled, with certainly no more influence on prices than what a general increase in prosperity might cause. There is, it will be observed, this great difference between gold and other commodities, that besides what may be within the crust of the earth, there is a great mass which has been accumulating for thousands of years in the possession of mankind, which comes forth as it is wanted. A few millions of tons of iron, or bales of cotton, beyond the usual annual average, would perhaps add a hundred per cent to the available quantity for consumption; but a few millions of pounds' worth of gold, having to be counted with all the gold in existence in the world, makes a scarcely perceptible addition to the stock.

The term B. is in this country associated with the memorable **BULLION REPORT** of 1810. In the year 1797, by what was called the restriction act (see **BANK**), the bank of England was restrained from paying its notes in gold. There thus came to be two separate and independent currencies in the country—one of B., the other of paper. They came to differ in value from each other so much that in the year 1813, gold, of which the mint price was £3 17s. 10d. per ounce, was actually worth, in bank paper, £5 10s., or, in other words, the one-pound bank-note was worth 14s. 2d. There were various opinions on the cause of this difference. Some people simply said that gold was dear, taking paper as the standard of value; others said it was owing to our exports not balancing our imports; others, to too great facilities in discounting, by which money was advanced on bad security; and in general, it was held that there could be no overissue of paper-money, if it was backed by good security, and employed only for genuine transactions, and not in fictitious credits. In the meantime, the select committee on the high price of gold B., had been wishing to get, not through theories or speculations, but through actual facts, at the truth. The work of the committee was chiefly conducted by Mr. Horner, aided by sir Robert Peel, then a young man; and both of them entered on the task without any prepossession, and the desire to find the truth. They established the conclusion, among other important truths, that paper-money is always liable to be overissued, and consequently depreciated, unless it be at all times immediately convertible into gold, and the monetary policy of the empire was subsequently established on this principle. A full analysis of the B. report will be found in Macleod's *Dictionary of Political Economy*.

BULLITT, a co. in n. Kentucky, on Salt river and Rolling fork, intersected by the Louisville and Nashville, the Bardstown, and the Lebanon branch railroads; 250 sq. m.; pop. '70, 7681—1194 colored. Productions chiefly agricultural. Co. seat, Shepherdsville.

BULLOCK, a co. in s.e. Alabama, on the Conecuh river, the Mobile and Girard, and the Montgomery and Eufaula railroads; 750 sq. m.; pop. '70, 24,474—17,257 colored. Productions, corn, cotton, etc. Co. seat, Union Springs.

BULLOCK, a co. in s.e. Georgia, between the Ogeechee and Cannouchee rivers; 900 sq. m.; pop. '70, 5610—1744 colored. It is level, with poor soil, in large part covered with pine forests, and abounding in game. Corn, cotton, and sweet potatoes are raised. Co. seat, Statesborough.

BULL RUN, a small stream in n.e. Virginia, falling into the Occoquan about 25 m. s.w. of Washington, the site of two important battles early in the war of the rebellion. The first battle took place July 21, 1861, the national forces commanded by gen. McDowell and the confederates by gens. Johnson and Beauregard. The forces were about 28,000 for McDowell and very nearly the same number on the other side, though not more than

18,000 union men were actually in the conflict. Until about 4 P.M. the advantage was evidently with the union side; but at that time an impetuous charge from Beauregard's whole line turned the tide, and the union army was completely routed and fled as best they could across the stream to Centreville, where a council of war was held and a retreat to Washington determined upon. The union loss was: killed, 481; wounded, 1011; missing, 1460. The confederate loss was: killed, 378; wounded, 1489; missing, 30.

On the 29th and 30th of Aug., 1862, the second battle was fought, gens. McDowell and Pope commanding the union forces, with gens. Lee, Jackson, and Longstreet on the other side. On the last day the unionists were defeated and fell back to Chancellorsville, where they suffered another repulse, and then retired to Washington. The forces engaged were about 35,000 union, and 46,000 confederate. No complete report of the union losses was given, but the figures for killed, wounded, captured, and missing are put at 11,000: Lee reported the confederate loss to be 1090 killed, and 6514 wounded, but the report was incomplete, others making the total loss 8400. The confederates call these engagements the "first and second battles of Manassas."

BULLS AND BEARS, a common designation in the stock market for two classes of operators; the "bulls" being those who seek to advance prices, and the "bears" those who endeavor to bring them down. A fanciful derivation of the term is that a bull tosses up with his horns, while a bear tears down with his claws.

BULL'S EYE, among the rigging of a ship, is a sort of small pulley in the form of a ring, with a rope spliced round the outer edge, and another sliding through a hole in the center.—B. E., in rifle practice, is the small black center within the circle of the target.

BULL-TERRIER, a cross-breed of the regular bull-dog and various kinds of terriers, having more docility than the bull-dog and all the sagacity of the terrier. The bull-terrier is a favorite house-dog, noted for watchfulness and its intense enmity to rats.

BULL TROUT, *Salmo erior* or *S. grisens*, a fish nearly allied to the salmon, and like it, migratory in its habits, ascending rivers, in which it deposits its spawn, but living chiefly in the sea. It occurs in many of the rivers of Britain, and is not unfrequently taken in the Tweed and its tributaries. It is frequently called the **GRAY TROUT**, sometimes simply the **GRAY**, and is the **SEWEX** of the Welsh rivers. It sometimes attains the weight of 20 lbs., although it is more commonly under 15 lbs. weight. It is less elegant in form than the salmon; the head and nape of the neck are thicker in proportion; and the tail, beyond the adipose fin, is more bulky and muscular; the tail fin is square at the end in young fish (in some places called *ichitlings*), and in older ones, becomes convex by the elongation of the central rays, whence the name *roundtail* sometimes given this species. The scales are rather smaller than those of a salmon of equal size, and the color is less bright; the males in the spawning season being reddish brown, the females blackish gray; at other times the general color is like that of the salmon trout. The B. T. agrees with the salmon in having only a few teeth on the most anterior part of the *vomer* (the bone which runs down the center of the palate); while the salmon trout, the common trout, and the great lake-trout, have a long line of teeth there: the teeth are larger and stronger than those of the salmon; there are differences also in the form of the gill-covers. To anglers the B. T. is next to the salmon as a prize, and by many is mistaken for it. The flesh is paler in color, coarser, with much less flavor, and is much less esteemed.—The name B. T. has been also given to the **HUCHO** (*salmo hucho*), or salmon of the Danube, which sometimes attains the size of 30, or it is said, even of 60 lbs.

BÜLOW, FRIED. WILH. VON, a famous Prussian gen. in the war of liberation, was b. in 1755, entered the army young, and soon distinguished himself. When Prussia declared war with France in 1813, it was B. that commanded in the first successful encounter with the French at Mœckern, April 5, and revived the self-confidence of the army after the adverse battle of Lützen. His victories over Gudinot and Ney at Grossbeeren and Dennewitz, saved Berlin, and inflicted severe loss on the enemy. He acted a conspicuous part in the battle of Leipsic, and by taking possession of Montmartre, finished the campaign of 1814. The king acknowledged his services by an estate worth £30,000, and the title of count Dennewitz. In the campaign of 1815, he joined Blücher by forced marches, and headed the column that first came to the aid of Wellington at Waterloo. He died at Königsberg, 11th Jan., 1818.

BÜLOW, HANS GUIDO VON, a celebrated pianist and composer, was b. at Dresden, Germany, Jan. 8, 1850. His father, a well-known author, who intended that he should study law, and was very much opposed to his adopting music as a profession, refused to support him after he had given up his law studies at Berlin. He was assisted by Liszt, who recognized his talent, and Richard Wagner secured him a position as leader of orchestra at a theater in Zurich in 1850. During the year 1851-52 he devoted himself to the study of the piano at Weimar, under the tuition of Liszt. In 1852, he made his first appearance in public as a pianist; edited the *Neue Zeitschrift für Musik*, and composed his famous overture to *Julius Cæsar*, which was performed with great success. In 1855, he became leading professor in the conservatory of music at Berlin, and in 1857, married Cosima, daughter of Liszt, from whom he was divorced in 1869. In 1875, he came to

this country and made a very successful concert tour. He never plays his own pieces at public performances, although his compositions are very numerous and often chosen by other artists. His larger works number over 30, and he has composed many songs and choruses. He is considered one of the leading pianists of modern times.

BULRAMPUR, a t. of Oude, India, near the frontier of Nepaul, in n. lat. $27^{\circ} 24'$, e. long. $82^{\circ} 15'$, on the Raptée, in a plain, 90 m. n.e. from Lucknow. It is a town of considerable size, but mostly of mud houses, covered with thatch. From B. there is a magnificent view of Dhawalagiri. The town is on one of the most frequented routes between Lucknow and Nepaul, so that during spring and summer it is much thronged by traders, exchanging the products of Hindustan and Thibet. Pop. '71, 14,026.

BULRUSH, an English popular name for large rush-like or reed-like plants growing in marshes, not very strictly limited to any particular kind. Some authors employ it in a restricted sense as the designation of plants of the genus *typha*, also known as cat's-tail or reed-mace. See *TYPHA*. It is perhaps more commonly restricted to large species of the genus *scirpus* (q. v.), also called club-rush, and particularly to *S. lacustris*, a common British plant, found also in all the northern parts of the world, growing about the muddy margins of lakes and ponds, with a creeping root and round stems varying from 2 to 8 ft. in height, which are almost leafless, and bear their flowers in compound umbels of small brown spikelets on their side. The root is astringent and diuretic, and was formerly employed in medicine; but the stems are the most useful part of the plant, being much employed for making chair-bottoms, mats, etc.; also by coopers for filling up spaces between the seams of casks, to which purpose their spongy nature particularly adapts them, and not unfrequently for thatching cottages.

BUL'SAR, a seaport of India, in the British district of Surat, presidency of Bombay, on the estuary of a small river of the same name, which falls into the gulf of Cambay. It is 44 m. s. of Surat. It is a thriving place, with manufactures of gingham, and a considerable trade in grain, salt, and sugar. Pop. '71, 11,313, chiefly weavers and sailors, but partly also employed in agriculture.

BULTI, or **LITTLE THIBET**, a territory lying on the upper Indus beyond the Himalaya, and forming a sort of debatable land between India and Tartary. It is immediately to the n. of the valley of Cashmere, with which it is politically connected by conquest. It occupies about 8000 sq. m., extending in n. lat. between $34^{\circ} 30'$ and 36° , and in e. long. between 75° and 77° . With an average elevation of about 7000 ft. above the sea, B. is surrounded by mountains of nearly the same height above its own level. Hence the temperature is such that only snow falls in what ought to be the rainy season, though in summer the thermometer ranges at noon from 70° to 90° F. European fruits are said to be plentiful. The inhabitants are of the Mongolian race, and chiefly Mohammedans. Among the animals are the sha, the large-horned goat, the sheep, the musk-deer, and the ibis. The only town of consequence is the capital, Iskardoh, which, in fact, sometimes gives its name to the whole province.

BULUBURH, or **BALLAMGARH**, a t. of India, the principal place of a jaghire of the same name, called also Furreedabad. The town is situated on the route from Delhi to Muttra, 29 m. s. of Delhi, in a pleasant well-cultivated country. The town is not large, and is very crowded, surrounded by a high brick wall, with mud bastions and a deep ditch. The jaghire has an area of 190 sq. m., and its pop. is supposed to be about 57,000. The British have never interfered with the civil or criminal affairs of the jaghire, except when their interference was requested, during the minority of the present rajah; but the rajah of B. derives his rights from the British government. The revenue of the state is estimated at 160,000 rupees. The rajah maintains a small force of 100 cavalry and 350 infantry.

BULWARK, in military matters, was the old name for a rampart or bastion. In a ship, the bulwarks are the boarding above the level of the upper deck, nailed to the outside of the timber-heads and stanchions. In ordinary vessels they form a parapet, protecting the seamen from the waves, and prevent loose articles from being swept off the deck; in men-of-war they, in addition, serve to protect the men from an enemy's shot. In an inquiry made a few years ago concerning the availability of merchant-steamers as ships of war, it was found that the bulwarks would not afford sufficient protection to the men from musket-shot; but that if hammock-stanchions were fixed all round the bulwarks, and the men's hammocks placed in a netting upheld thereby, a very good protection might be obtained.

BULWER, Sir HENRY LYTTON, G.C.B., the right hon., diplomatist and author, an elder brother of the late lord Lytton, was born in 1804, entered the diplomatic service in 1827, and was attached successively to the British embassy at Berlin, Brussels, and the Hague. In 1830, he entered parliament, and during the following seven years he represented, in order, the constituencies of Wilton, Coventry, and Marylebone. In 1837, he became secretary of embassy at Constantinople, where he negotiated and concluded a treaty which is the foundation of our present commercial system in the east. In 1843, he was made minister plenipotentiary to the court of Madrid, and concluded the peace between Spain and Morocco in the following year. Whilst in Spain, his firmness and candor proved a source of great inconvenience to Narvaez, the Spanish soldier-diplo-

matist of that day, and who, pretending to have discovered the complicity of the British plenipotentiary in certain plots against the Spanish government, ordered him to leave Madrid. Both parties in the house of commons approved of the whole course of B.'s conduct while at the court of Madrid, and her majesty awarded to him the highest decorations of the order of the Bath. He afterwards proceeded to Washington, where he evinced equal art in conciliating the temper of the people, and maintaining the interests of his own country. In 1852, he was sent to Tuscany as envoy extraordinary; and in 1856 was nominated by lord Palmerston commissioner at Bucharest for investigating the state of the Danubian principalities. As British commissioner, he called forth from every minister and from every government concerned the warmest expressions of approval, and all concurred in recommending him for the post of ambassador to the Ottoman porte, on the return of lord Stratford de Redcliffe, in the spring of 1858. Sir Henry Lytton became a peer in 1871, with the title of lord Dalling and Bulwer. He died in 1872. His works include a *Life of Palmerston*; *Historical Characters*; *An Autumn in Greece*; *France, Social, Literary, and Political*; and a *Life of Byron*.

BULWER-LYTTON, EDWARD ROBERT, Earl, only son of the English novelist, b. 1831: educated by private tutors; went into diplomatic service in 1849 under his uncle, sir Henry, who was then British envoy to the United States; afterwards served diplomatically at Florence, Paris, the Hague, Vienna, Copenhagen, Athens, Lisbon, Madrid, and again at Vienna and Paris. He succeeded to his title on the death of his father in 1873. In 1874, he was sent again to Lisbon as ambassador, and in 1876 was viceroy of India, where, Jan. 1, 1877, he presided at the ceremonial proclamation of Victoria as empress of India. In literature he is widely known, first as "Owen Meredith," the author of many poems, the chief of which is *Lucile*. Other works are *Tannhauser, or the Battle of the Bards*; *Neville Temple*; *Julian Fune*; songs of Servia; *The King of Amasis*; *Chronicles and Characters*; *Orval, or the Fool of Time*; imitations in verse from various languages; *Fables in Song*, etc.

BULWER LYTTON, SIR EDWARD. See **LYTTON**.

BUMBOAT, a boat employed to carry provisions and other articles from harbors and ports to vessels lying at some distance from the shore. Boats of this kind belong to a class of petty traders, who in England are, for the most part, women. The provisions commonly offered for sale are soft bread, butter, fruit, vegetables, fish, and fresh meat—the fish fried, and the meat roasted, if wanted. Among the other articles are included shirts, drawers, stockings, gloves, pipes, needles, thread, and a variety of odds and ends. The less respectable of the B. traders try to smuggle spirits on board; but if this is discovered, it leads to instant punishment. In fitting out and also in paying off ships in H. M. navy, the B. people are allowed on board for a certain length of time daily; but when a ship is in active commission, they come alongside only at meal-hours. Among the class of B. people generally, there is no little acuteness and enterprise. They learn all particulars about ships going and coming, and will even write to far-distant ports to secure a vessel's patronage. In their dealings, they of course prefer ready money, but in certain cases they give credit, and it is understood lose little by their liberality; for any attempt at evasion of payment by any of the crew, meets the displeasure of commanding officers. From Hong-Kong up to the Bogue forts, and in other Chinese waters, bumboats frequently accompany vessels, and are apt to become troublesome. From Malta and some other places in the Mediterranean, the bumboats also haunt vessels on short cruises, in the hope of doing a little trade.

BUMKIN, or **BOOMKIN** (diminutive of *boom*), on shipboard, is a short boom which projects over each bow of the ship, to aid in extending the lower edge or clue of the foresail to windward—in nautical phrase, "to board the fore tack to." In a boat, the B. is a small outrigger over the stern, used for extending the mizzen.

BUMMALOTI, *Saurus ophiodon*, a fish of the family *scopelidæ* or *sauridæ*, often regarded as a subdivision of the great family *salmonidæ*. It is a marine fish, a native of the coasts of India, particularly of the Bombay and Malabar coasts, from which it is exported in large quantities, salted and dried, to other parts of India, being highly esteemed for its rich flavor, and often used as a relish. In commerce, it is known not only by the name B., but by the singular appellation of *Bombay duck*. It is a fish of elongated form, with large fins and a very large mouth, the gape of which extends far behind the eyes, and which is furnished with a great number of long, slender teeth, barbed at the points. It is extremely voracious.

BUNCOMBE, a co. in s.w. North Carolina, n.e. of the Blue Ridge, on French Broad river and the Western North Carolina railroad; 450 sq.m.; pop. '70, 15,412—2303 colored; in '80, 21,640. The surface is rough, but the soil is fertile and good for cattle-raising. There are warm springs in the n.w. part. Corn, wool, and tobacco are the chief productions. Co. seat, Ashville.

BUNDELCUND, a territory of Hindustan, between Gwalior on the w. and the Jumna, which separates it from the Doab, on the n.e. The area formerly known as B. included four districts belonging to the British north-western provinces, (Banda, Jalun, Jhansi, and Hamirpur). Now B. is officially used only for the "Bandalkhand agency," a subdivision of the Central India agency and in this sense is applied to a group of nine native

states, and twenty-five petty jaghires under native princes. The area of the agency is 10,600 sq. m., and the pop. estimated (1872) at 1,278,000. Studded, as B. is, with isolated rocks, rising precipitously from its surface—each of them a nucleus, as it were, of independence—it has generally been very much subdivided. Notwithstanding that it is well watered, the climate renders irrigation indispensable; and it is accordingly interspersed, at the cost of great labor and ingenuity, with artificial dams. B., though not destitute of woodlands, presents rather jungle and copses than heavy timber. It is said to possess inexhaustible deposits of iron-ore and some coal. The principal towns of B. are Calpee, Jhansi, Callinger, Banda, Jalun, and Chaturpur. The first three are noticed in their places, Callinger being famous for its cave-temples, and Jhansi and Calpee having acquired celebrity in the mutiny of 1857-58.

BUNDI, or **BOONDEE**, a t. of India, in n. lat. 25° 26', e. long. 75° 43', 190 m. s.w. from Agra, the capital of a small state of the same name. It is situated in a valley nearly surrounded by rocky hills. The palace of the rajah is on the slope of the hill above the town, and is of great magnificence and beauty, consisting of a number of parts built at different dates, but harmonizing extremely well together. The town contains few notable edifices. It has two good bazaars, it is a place of little commerce. It is celebrated for its iron manufactures.—The raj or state of Bundi has an area of 2291 sq. miles. A range of mountains running n.e. and s.w., divides two nearly equal level tracts—that on the s.e. extending to the river Chumbul, and that on the n.w. to the base of the mountains towards Ajmere. The climate is said to be unhealthy. Although the rajah and dominant portion of the inhabitants are Rajpoots, the greater part of the population, particularly in the mountains, are Meenas, supposed to be an aboriginal race, who are indefatigable freebooters. The military force of the state, including the troops of the feudal chiefs and the police force, is 6170 men. The revenue is about £50,000. Pop. of B. 224,000.

BUNGALOW, a species of rural villa or house, so called in India. Bungalows which form the residence of Europeans are of all sizes and styles, according to the taste and wealth of the owner. Some are of two stories, but more usually they consist of only a ground floor, and are invariably surrounded with a veranda, the roof of which affords a shelter from the sun. In the chief cities of Calcutta, Madras, and Bombay some of the bungalows are really palatial residences, while in the mofussil they are of more moderate pretensions. In general, they are provided with exterior offices, to accommodate the large retinue of domestics common in Indian life. Besides these private bungalows, there are military bungalows on a large scale for accommodating soldiers in cantonments; likewise public bungalows, maintained by government for the accommodation of travelers, and in which seem to be blended the characters of an English road-side inn and an eastern caravanserai. These bungalows, though they vary greatly in actual comfort, are all on the same plan. They are quadrangular in shape, one story high, with high-peaked roofs, thatched or tiled, projecting so as to form porticoes and verandas. The B. is divided into "suits" of two, three, or four rooms, provided with beds, tables, and chairs; windows of glass, and framed glass doors. Off each room is a bath-room, and earthen jars of cool water. Travelers are expected to carry their servants, cooking-apparatus, wine, beer, bedding, etc., with them; but the khitmutgar of the better class of bungalows supplies table-ware, condiments, and even sometimes food and liquors, and he is usually skilled in cooking. Government charges one rupee, or two shillings a day, to each traveler for the use of the bungalow. A book is kept, in which travelers enter their names, the time of their arrival and departure, with the amount paid, and any remarks regarding the state of the B. and its attendance he may think proper. Natives seldom stop in these public bungalows, for though legally open to all, they are almost exclusively resorted to by Europeans; and natives even of good condition are fain to seek "the squalid desolation of a tottering caravanserai," or village "dhurrumsala." At every travelers' B. is stationed a government peon, who acts as watchman, and is bound to assist travelers' servants in procuring supplies of fuel and food in the nearest village. The distance between each B. on a trunk-road is generally about 12 or 15 m.—an Indian day's journey. The introduction of railways will very soon put an end to the present system of traveling in India—a fact greatly to be desired, as the annoyance experienced moving slowly on with baggage and servants at the rate of a stage a day is almost inconceivable.

BUNGAY, a market-t. of the co. of Suffolk, England, 30 m. n.n.e. from Ipswich. It occupies the sides and summit of a gently rising hill, on the right bank of the Waveney, and is a well-built town, with wide streets, the principal ones diverging from the market-place. The town grew around Bungay castle, which is supposed to have been erected by the Bigods, earls of Norfolk, and of the walls of which some ruins still remain. The ruins of a Benedictine nunnery are also to be seen in the town. The church of the Holy Trinity is an edifice with a round tower, supposed to be of the time of Edward the confessor. There are numerous places of worship, belonging to different denominations, and schools, charitable institutions, assembly-rooms, etc. What was formerly the theater is now used as a corn-hall. B. carries on a considerable trade by the river Waveney in corn, malt, flour, coals, and lime. Pop. '61, 3805; '71, 3503.

BUNIAS, a genus of plants of the natural order *crucifera*, distinguished by *incumbent* linear spirally twisted cotyledons (q. v.), and a nut-like silicle (or round pod) with 2 to 4 cells. Only a few species are known, natives of the Levant. One of these, *B. orientalis*, is cultivated in some countries—particularly in France—as a field-crop, for the sake of its leaves, which are used for feeding cattle. It was introduced into Britain more than 100 years since, but its cultivation has never become general, the amount of herbage which it yields being comparatively small. It is sometimes called **HILL MUSTARD**.

BUNION is a painful condition met with in the joints of the feet, most commonly at the junction of the great toe with its metatarsal bone. It is caused by a gradual displacement of the bones, the toe itself turning outwards, and leaving the head or further extremity of the metatarsal bone projecting inwards. Over the latter, the skin is generally thin, and occasionally a bursa (sac) is present between the skin and bone. The pressure of a boot causes this bursa to inflame, and this may go on to suppuration or painful ulceration. Rest, poulticing, and such remedies are generally sufficient to subdue any inflammatory attack, and wearing a shoe so constructed as to save the B. from pressure, will probably prevent a recurrence of painful symptoms; but amputation and excision of the ends of the bones have been resorted to for the cure of the troublesome distortion.

BUNION is a term applied in surgery to enlarged bursæ, or synovial sacs, situated in the anterior part of the foot, and especially over the metatarsal joint of the first or the fifth toe (see **FOOT**), and accompanied by more or less distortion of the joint. In the great majority of cases, bunions are directly produced by the pressure of badly-fitting boots; and if the boots are constructed of patent leather, or any material which stops the excreting action of the skin, this, too, may be regarded as an indirect cause of their formation. A bunion begins as a painful and tender spot over one of the metatarsophalangeal joints; the part gradually enlarges, and there are indications of an effusion into a natural bursa or a newly-formed sac. The progress of the affection may stop here, the bursa remaining, and serving to protect the subjacent parts from pressure; but far more frequently it undergoes repeated attacks of inflammation, causing its enlargement; or becomes the seat of corns; or suppuration of the contents of the cyst ensues. The last accident may be followed either by obliteration of the cyst, and cure, or by a troublesome form of ulcer, especially in persons of languid circulation.

It is only in its early stage that there is any hope of removing the disease; subsequently, the treatment must be only palliative. The tender spot that precedes the enlargement should be covered by night with wet lint and oiled silk, while by day a boot or shoe exerting no pressure on the part should be worn. If the part is very tender, it may be covered during the day with soap-plaster spread on wash-leather. As soon as a cyst can be detected, the part should be occasionally treated with strong tincture of iodine, with a view of promoting absorption. The writer of the article on this subject in Holmes's *System of Surgery*, recommends an ointment of biniodide of mercury (ten grains to an ounce of lard) for the cure of bunions when uninfamed, and for such as have much fluid within them. It should not be applied so constantly as to blister the skin. When, from any cause, inflammation takes place in the sac, water-dressing, or a poultice, should be applied; and as soon as there are definite signs of suppuration, a free incision should be made, which at once relieves the pain, and is often followed by a complete cure.

The ulcers resulting from the bursting of a bunion are very difficult to heal, especially in old persons whose circulation is languid. Stimulating local applications, such as ointment of resin, should be applied, while opium and stimulants should be prescribed for internal use, together with nourishing diet. Such ulcers, under the best treatment, not very unfrequently form the starting-point for senile gangrene.

BUNKER'S HILL. See **CHARLESTOWN**.

BUNKUM, a phrase used in the United States to signify an oratorical display in favor of a sham proposal, in order to catch popular applause. A member of the legislature, for example, desirous of standing well with his constituents, makes a flaming speech in favor of a measure in which they are interested; but with the knowledge that the measure is impracticable, and will not be carried. In fact, the speaker does not want to carry it; his sole object is to impose on his supporters, and acquire the character of a meritorious public leader. Such is speaking for bunkum. In some instances, the state legislatures enact laws brought forward on these dishonest grounds—the whole members, or at least a large majority of them, having no other object than bunkum. The consequence is, that many laws, agitated for by popular factions, remain a dead-letter, unless they happen to be enforced by clubs organized for the purpose. The word B. is said to be a corruption of Buncombe, the name of a county in North Carolina, the representative of which informed congress on one occasion that he was merely speaking "for Buncombe."

BUNODES GEMMA'CEA, a species of the order actinoida. See **ANEMONE**, **SEA**, *ante*.

BUNSEN, CHRISTIAN KARL JOSIAS, Baron, one of the most distinguished statesmen and scholars of Germany, was b., 25th Aug., 1791, at Korbach, in the principality of Waldeck, and studied philology at Göttingen (1809-13) under Heyne. He had been appointed teacher in the gymnasium of Göttingen in 1811, but quitted the position in 1813; and in pursuance of a course of study of old and middle high German, begun in company with Lachmann, and to extend his knowledge of the Germanic tongues, went to Holland, and afterwards to Copenhagen, where he learned Icelandic from Finn Magnussen. The historical works of Niebuhr and his character as a politician had filled B. with enthusiasm, and he spent some months of 1815 in Berlin, in order to become personally acquainted with the historian. In 1816, he went to Paris, and studied Persian and Arabic under Sylvestre de Sacy, and in the same year to Rome, where he married. Niebuhr, then Prussian ambassador, took the greatest interest in the scientific pursuits of B., and procured (1818) his appointment as secretary to the embassy. The residence of the king of Prussia, Friedrich Wilhelm III., in Rome in 1822, had a decided influence on his subsequent career. In the course of a conversation in which B. had disagreed with the king, the latter asked his views on the Prussian ritual (*Agende*) and hymn-book question, then much agitated. Though these views were very different from what the king had been accustomed to hear, he took them in good part, and with expression of his personal regard, requested B. to continue in the state service. On Niebuhr's departure from Rome (1824), B. conducted the embassy provisionally for a time, and was then appointed resident minister (1827). Living in intimate intercourse with Niebuhr, B. had employed the time in deepening his investigation into the philosophy of language and religion; and had made, on the one hand, the philosophy of Plato and the constitutions of antiquity; on the other, biblical inquiries, church history, and liturgies—objects of special attention. Though not within the scope of the great plan of his life, he contributed largely to the *Beschreibung der Stadt Rom* (Description of Rome), 3 vols. (Stutt. 1830-43); the greater part of the topographical communications on ancient Rome, and all the investigations into the early history of Christian Rome, are by him.—The first visit of Champollion to Rome formed an epoch in B.'s antiquarian studies. He was a zealous hearer of Champollion himself, and also encouraged Lepsius (q. v.) to the study of hieroglyphics. The archaeological institute, established in 1829, found in B. its most active supporter. When he founded the Protestant hospital on the Tarpeian rock (1835), he also built, adjoining his own house, a place of meeting for the institute; and labored earnestly for the cause of Protestantism. The king of Prussia had often asked his advice in the matter of the ritual, but had not adopted it. B. then, along with the chaplain, introduced (1835) into the chapel of the embassy at Rome a liturgy modeled after his own views, and sent a report (1838) to the king of the result. The king had this liturgy printed, and wrote the preface with his own hand. This work never came into the hands of the trade; but the most part of it was embodied in the *Allgemeine evang. Gesang- und Gebetbuch*, printed (1846) without the author's name, in the *Rauhe Haus*, Hamburg, which may be considered as the second edition of the *Versuch eines allgemeinen evang. Gesang- und Gebetbuchs* (Attempt at a General Evangelical Hymn and Prayer Book), Hamb. 1833.

In 1841, he was sent on a special mission to London, to negotiate the erection of an Anglo-Prussian bishopric in Jerusalem, and was shortly afterwards appointed ambassador at the English court. It is understood that, on occasion of a visit to Berlin in 1844, he was asked to write down his views on the question of granting a constitution to Prussia; and that in consequence he presented a series of memorials representing the urgency for a deliberative assembly, and also made a complete plan of a constitution closely resembling the English. In the Schleswig-Holstein question, B. strongly advocated the German view, in opposition to Denmark, and protested against the London protocol of 1850. But in the midst of all his political duties, B. continued unabated his literary and philosophical pursuits, the results of which have from time to time appeared. His views regarding the part that Prussia should act in the eastern question not being, it is understood, in accordance with those of his court, he ceased, in 1854, to represent Prussia at the court of England, and retired to Heidelberg. In the estimation of Englishmen, B. must ever hold a high place. No foreigner has ever shown a deeper appreciation of their national characteristics, or a heartier love of their social and political liberty. It must also be acknowledged that he has done service to the cause of enlightened Christianity, for while in England, he was regarded by those who knew him both as the most philosophical and most reverent of lay theologians. His chief works are: *De Jure Athenienseum Hereditario* (Gött. 1813); *Die Kirche der Zukunft* (the Church of the Future—translated into English, and published by Longman), Hamb. 1845; *Ignatius von Antiochien und Seine Zeit* (Ignatius of Antioch and his Time), Hamb. 1847; *Die drei echten und die vier unechten Briefe des Ignatius von Antiochien* (The Three Genuine and the Four Spurious Epistles of Ignatius of Antioch), Hamb. 1847; *Ägyptens Stelle in der Weltgeschichte* (Egypt's Place in the World's History—translated into English by Cottrell), Hamb. 1845-57; *Die Basiliken des Christlichen Roms* (The Basilicas of Christian Rome), 1843; *Hippolytus und seine Zeit* (Hippolytus and his Time), 1851; *Christianity and Mankind*, 1854; *Gott in der Geschichte* (God in History), 1857; and the *Bibelwerk*, which B. hoped to make his chief work, of which only a part appeared before his death, which took place in 1860. See *Memoir* by his widow (1868).

BUNSEN, ROBERT WILHELM, a distinguished German chemist, b. at Göttingen, where his father was a professor, on March 31, 1811. He entered the university of his native town in 1828, where he devoted himself to the study of the natural sciences, especially to zoology and chemistry. He afterwards prosecuted his favorite studies at Paris, Berlin, and Vienna. After having held the post of professor at Cassel, Marburg, and Breslau, successively, B. was, in 1852, appointed to the chair of chemistry at Heidelberg, where he has since remained. He has published numerous papers on physics and geology, as well as on chemistry. The charcoal pile and the burner which bear his name are in extensive use. That the hydrate of oxide of iron is an antidote to arsenic, is an important fact which was made known by him, along with his friend Berthold, in 1837. B. was the first to produce magnesium in large quantities; and, in 1860, he invented the magnesium light, which has proved so important to photography. But the greatest discovery with which his name is associated, is that of the spectrum analysis—made in conjunction with his friend Kirchhoff—which has been the means of working so many wonders in chemistry, and revealing so much to astronomers. Its first result was the discovery of two new metals. B. is not only a prolific discoverer in chemistry, but he has proved himself also one of its most successful teachers. His manner of demonstration is very happy. We have from his pen: *Descriptio Hygrometrorum* (Göttingen, 1830); *Eisenoxydhydrat* (2d ed., 1837); *Gasometrische Methoden* (1857; English by Roscoe); and other papers. The government of Baden made him a privy-councilor in 1863.

BUNT, a disease of wheat and other grains, or the parasitic fungus which causes that disease. The name B. is supposed to be a corruption of *burnt*, or at least derived from the same root, a derivation perhaps suggested by the analogy of *brand* (q.v.). B. is also called *pepper brand*, and sometimes *smut ball*. It is one of the most common and injurious diseases of wheat, often affecting great part of a crop, although its prevalence has been greatly diminished by care on the part of farmers, and particularly by the selection of clean seed, and the dressing of the seed, before sowing, with some substance, which, without injuring its vitality, destroys that of the spores or granules of the fungus. Even washing with water has a good effect, but greater benefit is derived from dressing with salt, quicklime, chloride of lime, Glauber's salt (sulphate of soda), and quicklime, or blue vitriol (sulphate of copper). Even arsenic and corrosive sublimate are used for this purpose. B. is now believed to be propagated by any contact of sound with unsound grain; by thrashing, which causes the B. dust to fly about; or by manure, in which the straw of infected grain has been mixed. Upon this knowledge, the means now adopted for its prevention are founded. A considerable mixture of B. is not supposed to render flour absolutely unwholesome, at least when made into fermented bread, but the bread is of a peculiar flavor, and a very dark color. It is said that such flour is used to no small extent in the manufacture of gingerbread, the treacle disguising both the color and the flavor.

BUNTER SANDSTEIN, or "variegated sandstone," is the lowest member of the triassic period. As the triass is more perfectly developed in Germany than in Britain, the German beds are considered the typical group of this period. The B. S. consists of various colored sandstones, interstratified with red marls and thin beds of limestone, which occasionally, as in the Harz, are oolitic, but in other places dolomitic. They attain a maximum thickness of 1500 feet. The English representatives of the B. S. are chiefly developed in Lancashire and Cheshire, and consist of red and mottled sandstones with beds of marl, and thick rather irregular bands of partially consolidated conglomerate called "pebble beds." Thirty species of fossil plants have been found in the B. S. near Strashurg, consisting chiefly of ferns, cycads, and conifers. But the most remarkable fossils in this formation are the remains of huge batrachians. Originally, the footprints which had been left by the animals on the moist sand were alone observed. From their resemblance to the impressions made by a human hand, the animal producing them was provisionally named *cheirotherium* (q.v.). The subsequent discovery and examination of the remains of teeth and bones in the same beds, have afforded sufficient materials to enable Owen to reconstruct an animal named by him *labyrinthodon* (q.v.), which undoubtedly produced the footprints. These remains have been detected in Lancashire and Cheshire, as well as in Germany.

BUNTINE, or **BUNTING**, is a thin woolen material, of which the flags and signals of ships are usually made.

BUNTING, *Emberiza*, a genus of birds closely allied to finches and sparrows, and included with them by some ornithologists in the great family *fringillidæ* (q.v.), but by others made the type of a distinct family, *emberizidæ*, of which the most marked characteristics are a short, straight, conical bill, a curved form of the gape, produced by a narrowing of the sides of the upper mandible, and a corresponding enlargement of the under one, and a hard rounded knob on the palate or inner surface of the upper mandible. This knob probably aids in crushing the seeds, which are a principal part of the food of these birds. The species of the B. family are numerous, and are arranged in several genera. The true buntings (forming the restricted genus *emberiza*) have the hind claw moderately short, curved, and strong, and the palatal knob large and bony. The COMMON B. or CORN B. (*E. miliaria*)—a bird considerably larger than a house-sparrow, brown, with darker streaks on the upper parts, whitish brown, with spots and lines of

dark brown on the under parts, and with a slightly forked tail—is frequent, particularly in low cultivated grounds in Britain, and in most parts of Europe, extending also into Asia, living in pairs during spring and summer, but in flocks in winter, and often visiting barn-yards at that season, along with chaffinches and sparrows. It is the largest of the British buntings. It is supposed that the winter flocks in Britain are much increased by migration from more northerly regions. This B. often passes the night on the ground in stubble-fields, and is taken in the nets employed for catching larks, and brought with them to market. It usually builds its nest on or very near the ground. Its notes are harsh and unmusical.—The REED B., or BLACK-HEADED B. (*E. shoeniclus*), is a species common in marshy situations, both in Britain and on the continent of Europe; a very pretty little bird, with black head and throat, strikingly contrasted with the white nape and sides of the neck.—The CURL B. (*E. cirrus*), of which the head is olive-green, with black streaks, and with patches of bright lemon-yellow on the cheeks and over the eyes, is a rare British bird, and belongs chiefly to the s. of Europe and the n. of Africa. To this genus belong also the Ortolan (q.v.) and the Yellow-hammer (q.v.).—The SNOW B. (q.v.) or SNOWFLAKE (*E. nivalis* of many authors), has been placed in the new genus *plectrophanes*. The name B. has been often very vaguely used, and many species have been almost indiscriminately called buntings or finches. The palatal knob affords the best distinctive character. North America has a number of species of bunting.—The BLACK-THROATED B. (*E. Americana*) is extremely plentiful on the prairies of Texas and other south-western parts of the United States; extending, however, as far as to Ohio, and even to Massachusetts. In the middle and northern states, it occurs only as a summer bird of passage. In its habits, it closely resembles the common B. of Europe; but the palatal knob is less hard.

BUNTING, JABEZ, an eminent Wesleyan minister, was b. at Manchester in 1779. At the age of 20, he devoted himself to ministerial work, in which he was very successful. He was elected president of the annual conference in 1820, and again in 1828, 1836, 1844. In 1834, he was chosen president of the theological institution belonging to the Wesleyan Methodist body, and he acted as one of the secretaries to the missionary society in connection with his denomination, for a period of more than twenty years. He was the chief authority in all matters relating to the government and polity of Wesleyan Methodism. On his retirement from official life in 1857, his friends presented him with an annuity of £200, in consideration of the great services he had rendered to Methodism. He did not live, however, to profit by their kindness and forethought, having died in June, 1858.

BUNYAN, JOHN, one of the most popular religious writers of any age, was b. at Elstow, near Bedford, in 1628. He was brought up to his father's trade of tinker, and spent his youth in the practice of that humble craft, of which his name alone now serves to lessen somewhat the disrepute. It has generally been taken for granted that his early life was very loose and profligate, on the sole ground of his terrible self-accusations in after-years, when, from the height of religious fervor and Puritan strictness, he looked back on dancing and bell-ringing as deadly sins. This point is satisfactorily disposed of by Macaulay (*Encycl. Britann.*, art. "Bunyan"). In his 16th or 17th year, he enlisted in the parliamentary army, and in 1645, was present at the siege of Leicester, where he escaped death by the substitution of a comrade in his place assentry. Nothing further is known of his military career. After leaving the army, he married, and soon after began to be visited by those terrible compunctions of conscience, and fits of doubt, sometimes passing into despair, which, with some quieter intervals, made his life, for several years, a journey through that valley of humiliation of which he afterwards gave so vivid a picture. Hope and peace came at last, and in 1655, B. became a member of the Baptist congregation at Bedford. Soon after, he was chosen its pastor, and for five years ministered with extraordinary diligence and success, his preaching generally attracting great crowds. The act against conventicles, passed on the restoration, put a stop to his labors; he was convicted, and sentenced to perpetual banishment. In the mean time, he was committed to Bedford jail, where he spent the next 12 years of his life, supporting the wants of his wife and children by making tagged laces, and ministering to all posterity by writing the *Pilgrim's Progress*. His library consisted of a Bible and Fox's *Martyrs*. The kindly interposition of a high-church bishop, Dr. Barlow of Lincoln, at length released him, and he at once resumed his work as a preacher, itinerating throughout the country. After the issuing of James II.'s declaration for liberty of conscience, he again settled at Bedford, and ministered to the Baptist congregation in Mill lane till his death, at London, of fever, in 1688. B.'s whole works were published in 1736, in 2 vols. folio. The most popular of them, after the *Pilgrim's Progress*, are the *Holy War*—another allegory, much less successful—and *Grace Abounding to the Chief of Sinners*, an autobiographical narrative. It is supposed that no other book, except the Bible, has gone through so many editions, and attained to so wide a popularity, in all languages, as the *Pilgrim's Progress*. A fac-simile reprint of the original edition of the *Pilgrim's Progress* was published in 1875. A statue of B. was unveiled at Bedford in 1874.

BUNZLAU, a t. of Prussia, in the province of Silesia, is situated on the Bober, about 25 m. w.n.w. of Liegnitz. B. has manufactures of woolens, linens, hosiery, tobacco,

and earthenware, and a trade in grain. An obelisk to the Russian gen., Kutusow, who died here in 1813, adorns the market-place. Pop. '75, 9959.

BUNZLAU, JUNG, a t. of Bohemia, on the left bank of the Iser, about 32 m. n.e. of Prague. B. is well built, has an old castle, and manufactures of cotton, woolen, soap, leather, etc. It is said to owe its origin to king Boleslaf, who founded it in the 10th century. Pop. '69, 8695.

BUNZLAU, JUNG OR NEUE (*New Bunzlau*), a t. of Bohemia, on the left bank of the Iser, a tributary of the Elbe, 31 m. n.e. from Prague. It is well built of stone, has several churches, a Jewish synagogue, barracks, a hospital, a Piarist gymnasium, etc. It has manufactures of cotton and woolen fabrics, soap, and leather. It is said to have been founded by king Boleslaf in 973, and the fort built by him still exists. Its Bohemian name is *Mlada Boleslaw*. Pop. 5000.

BUOL-SCHAUENSTEIN, KARL FERD., Count, Austrian statesman, was b. 17th May, 1797. After filling subordinate diplomatic posts, he became ambassador at Carlsruhe in 1828, afterwards at Stuttgart (1838) and at Turin (1844). Leaving Turin on the outbreak of the war in 1848, he went as ambassador to St. Petersburg, and it fell to him to uphold the interest and dignity of his country, on occasion of the aid given by Russia in the Hungarian war. A not less difficult task was assigned him when, in 1851, he was sent to represent Austria in London; his address and conciliatory bearing contributed not a little to bring about a more friendly feeling between the two governments. On Schwarzenberg's death, B. was recalled to Vienna, and became foreign minister. In this position, he carried out the new politics of Austria no less firmly and successfully, though more moderately and quietly, than his predecessor. In the negotiations during and after the termination of the Crimean war, B. showed himself a skillful and able statesman. After defending with zeal and ingenuity, in diplomatic notes and circulars, the position which Austria had taken up with reference to Sardinia, B. suddenly, on the actual commencement of the Italian campaign of 1859, resigned his place, which was immediately filled by count Rechberg. Failing health was the cause officially assigned for the step, but the general belief was, that it indicated a triumph of the war-party in the council of Francis Joseph. He died Oct. 28, 1865.

BUONAFEDE, APPIANO, 1716-93; an Italian philosopher and general of the Celestines; author of several works on philosophical themes.

BUONAROTTI, MICHAEL ANGELO. See **MICHAEL ANGELO**, *ante*.

BUOY is a floating body, intended as a mark for the guidance of mariners. It is made either of wood or metal, and is mostly hollow, to make it float better. Buoys are generally moored by chains to the bed of the river or channel. They are of various shapes and sizes, and are painted of various colors, partly to render them conspicuous, and partly to distinguish them one from another. Sometimes floating buoys mark out the best channel for entering a dock; sometimes they warn the mariner away from sands, spits, and shoals; sometimes they mark out a continuous double-line, as at Spithead, between which ships can alone with safety enter a harbor. The Trinity house has adopted a form of B., invented by Mr. Herbert, in which, by due attention the center of flotation, and to the point where the mooring-chain is fixed, the tendency to pitch and roll is much lessened, and the B. kept nearly upright in all weathers. Messrs. Brown and Lenox's *bell-buoy* is an ingenious contrivance for rendering a B. audible, whether it is visible or not; so long as any stream of water, whether caused by a tide or a current, passes through the lower part of the B., it moves an undershot water-wheel, which rings a bell.

The lighting of coast-buoys by means of compressed gas has been of late successfully attempted. Experiment proved that buoys 5 ft. by 3 ft. could contain enough of gas (made from shale-oil refuse or the like) to keep up a brilliant light for a month or more at a time.

BUOYANCY, of ships, is the amount of weight which can be buoyed up by the hull. The B. of a vessel is proportionate to the weight of water displaced by its presence (see **HYDROSTATICS**), and is found in this way: The cubic feet of the part of a vessel to be immersed being known, multiply it by the weight of a cubic foot of water (62.5 lbs.), and the product will be the weight of water displaced. From this subtract the weight of the vessel, and the result will be the B. or the weight a vessel will carry without sinking lower than the given line. It is admitted, however, by naval architects, that all the old rules concerning B., displacement, and flotation, must undergo modification by the introduction of iron ships, paddle and screw propulsion, and the increased weight of broadside.

BUOY-DUES. Buoys are under very stringent regulations, on account of their importance to the safety of ships. The public buoys, for guiding into channels, and warning from shoals and rocks, are usually marked on the best charts relating to that particular water-way. The corporation of the Trinity house has a peculiar jurisdiction over the buoys and beacons in the Thames, and along the Essex and Suffolk coasts; as well as on other coasts in England and Wales. All ships which enter the ports within this jurisdiction pay a small sum as buoy-dues. The payment is sometimes a tonnage rate, varying from 0½d. to 2d. per ton; sometimes a rate per vessel, varying from 4d. to 3s.; some-

times a payment on entering only, at others on departure as well as on entering; while some kinds of coasting vessels pay 5s. per annum, whatever may be the number of voyages. From the Thames buoys alone, the Trinity house receives £14,000 per annum. as dues.

BUPALŪS AND ATHENIS, Greek sculptors, 540 B.C., in the isle of Chios. They were brothers, and sons of Anthermus, also a sculptor. As they produced only draped figures, it is inferred that the art had not advanced so far as to attempt nude subjects. It is said that B. made a caricature of the poet Hipponax, who was naturally intensely ugly, and that the poet retorted by verses that drove the sculptor to suicide.

BUPHAGA. See BEEFEATER.

BUPHONIA, or **DIIPOLIA**, a religious festival held in Athens on the 14th July, when the very old ceremony of sacrificing an ox to Zeus was observed.

BUPRESTIS, a Linnæan genus of coleopterous (q.v.) insects, now divided into a number of genera, and forming a tribe or family, *buprestidæ*, of which some hundreds of species are known, most of them belonging to tropical countries, and remarkable for the splendor of their colors. The colors are generally metallic in their luster, have frequently a burnished appearance, and are often beautifully iridescent. One of the largest species, *B. gigas*, is a native of Cayenne: it is about 2 in. long. The English and other European species are all comparatively small. Most of the species spend the night on trees, shrubs, and other plants, flying about during the hottest part of the day. Some of them are popularly known as **GOLDEN BEETLES**. Plants are sometimes seen studded with them in the morning, as with gorgeous flowers. The golden *elytra* (wing-cases, see **ELYTRA**) of some species are used to enrich the embroidery of the Indian zenana; and the lustrous joints of the legs are strung on silken threads, and form necklaces and bracelets of singular brilliancy. The species of *buprestidæ* found in England are few; none have yet been found in Scotland. The larvæ seem sometimes to be transported from one country to another in timber.

BUR, in an engraving, is a slight ridge of metal raised on the edges of a line by the *graver* or the *dry point*. As the B. produces an effect like a smear, it is usually regarded as a defect, and scraped off. Some etchers, however, take advantage of it to deepen their shadows, and Rembrandt made use of it in this way with telling effect.

BURANHEM, or **BURUNHEM**. See **MONESIA BARK**.

BURANO, an island and t. of northern Italy, in the Adriatic, about 5 m. n.e. of Venice. The island supplies a large proportion of the vegetables consumed in Venice. B. has some lace-manufactures, boat-building, and an extensive ropework, but the inhabitants are chiefly employed in fishing. Population of town, 5000; of commune, 7000.

BURBAGE, or **BURBADGE**, **RICHARD**, d. 1619; an English actor, son of James, also an actor. Richard was the first person to receive license as a player (1574), and was for many years a business and professional associate of Shakespeare, acting "Richard III.," "Proteus," and other leading characters.

BURBOT, *Lota vulgaris*, a fish of the same genus with the ling (q.v.), and of the same family with the cod, haddock, etc., being the only British fresh-water species of that family, *gadidæ*. It is found in the Cam, the Trent, and other rivers of the eastern and midland counties of England, but is one of the most local of British fresh-water fishes. It is found also in various parts of the n. of Europe, and at least as far s. as Switzerland; in Siberia and other parts of Asia, even, it is said, in India. In English rivers, it often reaches 2 or 3 lbs. in weight, but has been taken of 8 lbs. weight; and in some parts of Europe, it is said to reach 10 or 12 lbs. weight. In appearance, the B. very much resembles the ling, but is rather thicker at the neck, and tapers rather more rapidly, although still of a somewhat elongated form. It has two dorsal fins, the first short, the second very long, and a very long anal fin. It differs from the ling in the form of the tail-fin, which is oval and slightly pointed; but agrees with it in having a single barbule on the lower jaw. It is of a yellowish-brown color, clouded and spotted with darker brown on the upper parts, the under parts lighter; the scales are small; and the whole body is covered with a mucous secretion. The flesh is white, firm, and of good flavor; "and as the B. is in its nature extremely hardy, few difficulties present themselves in the way of their increase in quantity, while the value of the fish would amply repay the trouble or the cost of the experiment."—*Yarrell*. The B. is capable of living for a long time out of water. It is commonly taken by trimmers and night-lines, as it feeds principally during the night. Its food consists of small fishes, worms, mollusca, etc. Its liver yields an oil similar to cod-liver oil.

BURBRIDGE, **STEPHEN GANO**, b. Ky., 1831; bred to the law, but engaged in mercantile business and farming. When the war of the secession began, he entered the union service, and was distinguished for bravery in many engagements. He resigned after the close of the war, with the rank of brevet brig.gen.

BURCKHARDT, **JOHN LEWIS**, an enterprising African traveler, was b. at Lausanne, in Switzerland, Nov. 24, 1784. In 1806, he came to London, and was introduced by sir Joseph Banks to the African association, which accepted his services to explore the

route of Hornemann into the interior of Africa, and he embarked for Malta, Feb. 14, 1809. He had previously qualified himself for the undertaking by a study of Arabic, and also by inuring himself to hunger, thirst, and exposure. From Malta he proceeded, under the disguise of an oriental dress and name, to Aleppo, where he studied about two years, at the end of which time he had become so proficient in the vulgar Arabic, that he could safely travel in the disguise of an oriental merchant. He visited Palmyra, Damascus, Lebanon, and other remarkable places, and then went to Cairo, his object being to proceed from thence to Fezzan, and then across the Sahara to Sudan. No opportunity offering itself at the time for that journey, he went into Nubia. No European traveler had before passed the Derr. In 1814, he traveled through the Nubian desert to the shore of the Red sea and to Jeddah, whence he proceeded to Mecca, to study Islamism at its source. After staying four months in Mecca, he departed on a pilgrimage to Mt. Arfat. So completely had he acquired the language and ideas of his fellow-pilgrims, that, when some doubt arose respecting his Mohammedan orthodoxy, he was thoroughly examined in the Koran, and was not only accepted as a true believer, but also highly commended as a great Moslem scholar. In 1815, he returned to Cairo, and in the following year ascended Mt. Sinai. The Fezzan caravan, for which he had waited so long, was at last about to depart, and B. had made all his preparations for accompanying it, when he was seized with dysentery at Cairo, which terminated his life in a few days, Oct. 15, 1817, at the early age of 33. As a holy *sheik*, he was interred with all funeral honors by the Turks in the Moslem burial-ground. His collection of oriental MSS., in 350 volumes, was left to the university of Cambridge. His journals of travel, remarkable alike for their interest and evident truthfulness, were published by the African association. B. was a man born to be a traveler and discoverer; his inherent love of adventure was accompanied by an observant power of the highest order. His personal character recommended him to all with whom he came in contact, and his loss was greatly deplored, not only in England, but in Europe. His works are—*Travels in Nubia*, 1819; *Travels in Syria and the Holy Land*, 1822; *Travels in Arabia*, 1829; *Notes on the Bedouins and Wahabis*, 1830; and *Manners and Customs of the Modern Egyptians*, 1830.

BURDEKIN, a river in n.e. Australia, in the colony of Queensland, about 350 m. long, falling into Upstart bay.

BURDEN, a term of law in Scotland, used to signify any restriction, limitation, or incumbrance affecting either person or property. Burdens are said to be either personal or real. Where a party is taken bound by acceptance of a right to pay a certain sum to another, but where there is no clause charging the subject conveyed with the sum, the burden is said to be *personal*; that is, it will be binding upon the receiver and his representatives, but will constitute no real incumbrance on the lands, or other subject conveyed, nor amount, indeed, to anything more than a mere personal obligation on the grantor. But where the right is expressly granted under the burden of a specific sum, which is declared a burden or charge on the lands themselves, or where the right is declared null if the sum be not paid, the burden is said to be *real*.

By the 10 and 11 Vict. c. 48, real burdens need not be inserted in full in conveyances, if they have already been set forth in an instrument of title, in which case they may be referred to in the terms, or as nearly as may be in the terms, set forth in schedule C annexed to the act. A similar provision is made in regard to lands held in burgage tenure, by the 10 and 11 Vict. c. 49.

BURDEN, or **BUR'THEN**, of a ship. See **TONNAGE**.

BURDEN, HENRY, 1791-1871; b. Scotland; son of a farmer; came to the United States in 1819, and the next year made the first cultivator used in agriculture in this country. His inventions include improvements in plows, a machine for making iron spikes, and one for fashioning horseshoes which produced 60 shoes per minute from the bar. He was agent and afterwards proprietor of the Troy iron and nail works, one of the largest manufactories in the world. He devoted much attention to steam navigation, and built, in 1853, a steamboat which from its shape was called the "cigar boat," but it was lost before its speed had been fairly tried.

BURDEN OF PROOF, in legal procedure, signifies the obligation to establish by evidence certain disputed facts; and, as a general rule, this burden lies on the party asserting the affirmative of the issue to be tried or question in dispute, according to the maxim *ei incumbit probatio qui dicit non qui negat*—that is, proof is incumbent on him who asserts, not on him who denies. The principle of the law is, that the B. of P. is on the party who would fail if no evidence were adduced on either side. Accordingly, it almost always rests on the plaintiff in an action, or on the party asserting the facts on which the result of the litigation must depend. In one case tried before the late baron Alderson, that learned judge laid down that the proper test was, *which party would be successful, if no evidence at all were given?* the B. of P., of course, falling on the party not in that position. This test has since been generally adopted and applied; but Mr. Best, in his learned work on the *Principles of Evidence*, improves on it by the suggestion, that in strict accuracy the test ought to be, "which party would be successful, if no evidence at all, or no more evidence, as the case may be, were given?" a consideration on which the discretion and judg-

ment of counsel frequently depend. But although such, in general, is the position of the plaintiff, it sometimes happens that the B. of P. is imposed on the defendant, and in consequence of his having the affirmative of the material issue to be tried.

It is this rule as to the B. of P. that demonstrates the real nature of the plea of *not guilty* in a criminal prosecution, and which divests that plea of the objections to it which are frequently heard expressed by overscrupulous sentimentalists; for the meaning of that plea is not necessarily an assertion by the prisoner that he is absolutely guiltless or innocent, but that he wishes to be tried, and that as the B. of P. is on the prosecutor, while he has meanwhile the presumption of innocence in his favor.—Besides the work referred to, see on the subject of this article Starkie on the *Law of Evidence in England*, and Dickson on the same subject in Scotland.

BURDENS, PUBLIC. See PUBLIC BURDENS.

BURDER, Rev. GEORGE, an active and influential minister of the Congregational body, was b. in London, June, 1752. After studying some time as an artist, he devoted himself to the ministry, and in 1778 was appointed pastor of an independent church at Lancaster. He afterwards removed to Coventry, and in 1803 to London. Here he became secretary to the London missionary society, and editor of the *Evangelical Magazine*, the duties of which offices he discharged with great zeal, until failing health compelled him to resign. B. took a prominent part in all the religious movements of his time. He died May, 1832. His *Village Sermons* have been translated into several European languages; and he was the author of other series of sermons and publications which have had an immense circulation.

BURDETT, Sir FRANCIS, Bart., the most popular English politician of his time, b. Jan. 25, 1770. Educated at Westminster school and Oxford university, he spent some years on the continent, and was a witness to the progress of the first French revolution. In 1793, he married Sophia, youngest daughter of Thomas Coutts, esq., the wealthy London banker, and in 1796 was elected M. P. for Boroughbridge, Yorkshire. In 1797, on the death of his grandfather, he succeeded to the baronetcy. In the house of commons, he made himself conspicuous by his opposition to government and the war, and his advocacy of parliamentary reform, Catholic emancipation, and other liberal measures, most of which were afterwards carried. One of the most effective political speakers of that excited period, he for many years prominently occupied public attention, and was the idol of the London populace. Having succeeded in obtaining a parliamentary inquiry into the abuses of the metropolitan prisons, he became, in 1802, a candidate for Middlesex. He was first returned, then unseated, and after a second contest, defeated. At the general election of 1806, B. again became a candidate for Middlesex, but was defeated. In May, 1807, he fought a duel with Mr. James Paull, one of the candidates for Westminster the previous year. Soon after, he was returned, with lord Cochrane, for Westminster, which he represented for nearly 30 years. B. having in 1810 published, in Cobbett's *Political Register*, a letter to his constituents, declaring the conduct of the house of commons illegal in imprisoning John Gale Jones, the speaker's warrant was issued for his apprehension, as being guilty of a breach of privilege. Refusing to surrender, he for two days barricaded his house; the populace supported him in his resistance, and in a street contest between them and the military some lives were lost; but on April 9, the sergeant-at-arms, aided by the police and military, obtained an entrance, and conveyed him to the Tower. The prorogation of parliament restored him to liberty. Prosecuted in 1819 for a libel contained in a letter to his constituents, strongly animadverting on the proceedings of the magistrates and yeomanry at the memorable Manchester meeting, he was sentenced to three months' imprisonment in the king's bench, and to pay a fine of £1000. In 1835, he deserted the liberal party, and joined the conservatives. In 1837, he was returned for Wiltshire. He died in 1844.

BURDETT-COUTTS, The Right Hon. ANGELA GEORGINA, Baroness, daughter of sir Francis Burdett, was b. in 1814. In 1837, she inherited much of the property of her grandfather, Thomas Coutts, the banker, on the death of his widow, who died duchess of St. Albans. The liberal and public-spirited use she has made of this wealth, in her efforts to mitigate the sufferings of her fellow-creatures and the lower animals, has rendered her name well known and deservedly popular. Besides spending large sums of money in building and endowing several churches and schools, she endowed the three colonial bishoprics of Cape Town, Adelaide, and British Columbia, at an outlay of about £50,000, and founded an establishment in South Australia for the improvement of the aborigines. In her zeal for the good of her own sex, she effected important reforms in the teaching of girls at the national schools, and established a shelter and reformatory for fallen women. To the city of London she has presented, besides several handsome fountains, the Columbia market, Bethnal green, for the supply of good and wholesome food in a poor district. She also built Columbia square, consisting of model dwellings at low rents, for about 300 families; and, taking great interest in emigration, has assisted many poor families in their passage and outfit. Her private charities have been on a corresponding scale; and she is also a liberal patroness of art. In 1871, she accepted a peerage from government, with the above title. In 1872, the freedom of

the city of London was conferred upon her (the first woman who ever received it); and in 1874 she received the same honor from Edinburgh.

BURDOCK, *Arctium*, a genus of plants of the great natural order *compositæ* (q. v.), tribe *cynarocephalæ*. The heads of flowers are globose, or nearly so; and each of the scales of the involucre runs out into a long rigid prickle, which is hooked at the point. By means of these hooks, the flower-head, popularly called a *burr*, readily lays hold of the clothes of a passer-by, the wool of a sheep, or the like, and thus the seeds are transported from one place to another, the short hairy pappus being insufficient to waft them far on the wind. The common B. (*A. lappa*), of which varieties very slightly distinguished have sometimes been described as species (*A. bardana*, etc.), is abundant in waste and bushy places, by waysides, etc., in Britain and throughout Europe, scarcely, however, growing except in rich land. Its root is biennial, large, and fleshy, somewhat carrot-shaped; the root-leaves large, stalked, heart-shaped; the stem stiff, upright, somewhat branched and leafy, 3 ft. or more high. The whole aspect of the plant is coarse, and it is somewhat clammy to the touch. The root is sometimes used in medicine, being diaphoretic and diuretic, and acting upon the cutaneous system and the kidneys. It is capable of being made a substitute for sarsaparilla. When fresh, it has a disagreeable smell, but when dry it is inodorous; it has a sweetish mucilaginous taste, becoming afterwards bitterish and rather acrid, and contains chiefly inulin, bitter extractive, mucilage sugar, and a little tannin. In many countries, the roots, young shoots, and young leaves of B. are used in soups; and the plant is cultivated for this use in Japan. The roots are said to resemble artichokes in taste. The leaves and their expressed juice are sometimes applied to burns and suppurations.

BURDWAN, a city in the district and province of the same name, in the government of Bengal, on the Grand Trunk road from the Hoogly to the n. w. provinces, in lat. 23° 12' n., and long. 87° 56' e., 74 m. from Calcutta, with which it is connected by railway. In point of architecture, it is a miserable place—an aggregate, as it were, of second-rate suburbs. Pop. '71, 32,321.

BURDWAN, the district of the last-mentioned city, lying between Beerbloom on the n., and Hoogly on the south. It stretches in n. lat. from 22° 52' to 23° 40', and in e. long. from 87° 21' to 88° 23'. It has an area of 3523 sq. m., with (1871) 2,034,745 inhabitants, or 577 to the sq. m.—a proportion which certainly seems to justify a name that signifies *productive*. The district is largely engaged in the refining of sugar. It exports also iron and coal; chiefly, however, brought from the mines of Bancoorah, the district on the west. Next to the capital, Cutwa and Culna are the chief towns.—The *division* of B. has an area of 12,719 sq. m., and a pop. (1871) of 7,286,957.

BURE, or **BUR**, a mythical being who stands in Norse mythology as the grandfather of Odin, the supreme deity in that religion. The larger portion of Snorro Sturleson's work known as the *Younger* or *Prose Edda* (in distinction from the poetical or *Elder Edda*) is devoted to the *fooling of Gylfi*, and these two older and younger Eddas correspond in that old heathen religion very nearly to the old and new testaments in Christianity. It is not in place here to tell all the strange adventures of Gylfi in his search for the origin of things, but only so far as concerns Bure. Gylfi (who was a king of Svithiod, or Sweden) journeyed to Asgard (the home of the gods) in search of knowledge, and the gods, knowing of his coming and his purpose, were ready to answer him. After he had been satisfied about the gods, their number and attributes, Gylfi asked about their origin. He was told that, many ages before the earth was made, Nifheim (the nebulous or shadowy region) was formed; that in the middle of Nifheim was a spring called Hvergelnur (the roaring cauldron), from which twelve rivers flowed. When the rivers had flowed far from their sources the venom which they rolled along hardened, as does the dross that runs from a furnace, and became ice. The ice stood still, and the vapor that gathered over it froze into rime, or frosty-snow, and in this manner were formed in Ginnunga-Gap (the yawning abyss, or all space) many layers of congealed vapor, piled one upon another. But the southern part of Ginnunga-Gap was filled with sparks and flashes of fire that flew into it from Muspellheim (the home of elemental fire). In the conflict of elements the rime was melted and the melted drops took a human semblance, and the being thus formed was named Ymir (the primordial giant). Another creature formed from this conflict of heat and cold was a cow named Audhumla (darkness), and from her teats ran four streams of milk, on which Ymir was fed. "But," asked Gylfi, "on what did the cow feed?" The answer was that she supported herself by licking the surrounding stones, which were covered with hoar-frost and salt. The first day she licked there appeared the hair of a man; the second day the head came to view; and the third day the whole man appeared. This man was called Bur or Bure ("born," whence old German "barn," and Scottish "bairn," a child). This first creature in the form of a man was the father of Bór (also meaning born), who took for his wife Besla, the daughter of the giant Bolthorn (calamity or evil), and this pair were the parents of Odin, the Norse allfather, and his brothers Veli and Ve. No wife is named for Bure, nor is anything further related of him.

BUREAU, a French word signifying a writing table or desk; also, an office for transacting business, a department of government or the officials that carry it on. **BUREAU**,

CRACY is popularly applied to signify the kind of government, exemplified in many continental states, where a host of government officials, regularly organized and subordinated, and responsible only to their chiefs, interfere with and control every detail of public and private life—the evil which the Germans call “much-government” (*viel-regieren*).

BUREAU, a co. in n.w. Illinois on the Illinois river; 800 sq.m.; pop. '70, 32,415; level and fertile, with little timber; the chief business is agriculture. It is intersected by the Chicago and Rock Island and other railroads. Co. seat, Princeton.

BUREN, MARTIN VAN, a president of the United States of America (1837–41), was b. at Kinderhook, in Columbia, N. Y., Dec. 5, 1782. Educated for the bar, he was elected, in 1812, senator in the legislative assembly of New York, and in 1821 took his seat in congress, where he supported democratic measures. In 1829 he was made secretary of state, and in 1837 he succeeded gen. Jackson in the presidency, being elected by a majority of 24 votes over his rivals, Clay, Webster, and Harrison. On beginning the duties of his office, he found himself involved in such financial perplexities, that he immediately summoned congress to an extraordinary session, and proposed an entire separation of state-finance from the banks of the union, a proposition which was decisively rejected, and B.'s popularity was greatly damaged. In 1840, he had to yield his place to gen. Harrison, the Whig candidate; and in 1844, when he again stood for the presidency, he was defeated by Polk. The result of this vote divided the democrats into two parties, one of which, at a convention at Utica, unanimously declared for Van B. as president for 1848; but his election was prevented by the military renown of gen. Taylor, who left both Van B. and Cass with minorities. In 1856, he was again named for the presidency; but the majority of the democratic party preferred Mr. Buchanan. He died July, 1862.

BURG, a t. of Prussia, in the province of Saxony, situated on the Ihle, about 13 m. n.e. of Magedeburg. It is walled, and has long been famous for its extensive woolen manufactures. It has also manufactures of linen, yarn, steel, pottery, and leather; dye-works, distilleries, foundries, etc., and a large trade in agricultural produce. Pop. '75, 15,262.

BURGAGE TENURE is a species of holding in the law of real property which prevailed both in England and Scotland, although somewhat differently regarded in these two countries. In England, it is a species of free *socage* (q.v.) holding, and it prevails where the king or other person is lord of an ancient borough in which the tenements are held by a certain and determinate rent, and subject to a variety of customs, the principal and most remarkable of which is that called *Borough English* (q.v.). Among the other customs was a law that the wife shall be endowed with all her husband's tenements, and not with the third part only, as at common law.

In Scotland, by this tenure is meant a peculiar sort of military holding affecting property in royal burghs, the sovereign being superior or over-lord, and each individual proprietor or burgess holding direct of the crown, for the *reddendo* or service of *watching and warding* (q.v.). This service is otherwise termed “service of burgh used and wont,” and is now merely nominal. Although the burgesses hold immediately of the crown, they do not receive their formal entry directly from the sovereign, but from the magistrates of the burgh, as the crown's commissioners. If the burgh, as such, ceases to exist, the crown does not thereby lose its rights over the proprietors, for they continue as crown vassals (q.v.). The statutes 31 and 32 Vict. c. 101, and 32 and 33 Vict. c. 116, abolished many useless forms in this tenure. See **TENURE OF LAND**.

BURGAS, or **BURGHAZ**, a t. of Turkey, in the province of Eastern Roumelia, on a promontory in the Black sea, about 76 m. n.e. of Adrianople. B., which is well built and clean, has manufactures of pottery of a superior kind, and a good trade in agricultural produce. Pop. about 6000. The gulf of Burgas, at the head of which the town is situated, is about 14 m. in length, and has a depth varying from 5 to 12 fathoms.

BURGDORF (FR. BERTHOUD), a t. in Switzerland, on the Emme, 14 m. from Bern. It is over 1800 ft. above sea level, and consists of a lower and an upper part, which are connected by spiral streets. There are an ancient castle, a town-house, hospital, library, etc.; also ribbon, tobacco, and chocolate manufactures, and a large trade in dairy products. In 1384 the town and countship were purchased by Berne for 37,000 florins, and the Bernese magistrates held rule until 1798. Pestalozzi had his school in the castle for a number of years. Pop. '70, 5078.

BUR GEO ISLANDS, belonging to England, and lying between Newfoundland and cape Breton, in lat. 47° 33' n., and long. 57° 44' west. Besides being valuable as a fishing-station, they occupy a commanding position with respect to British North America in general, and the gulf of St. Lawrence in particular. The group has 700 inhabitants.

BÜRGER, GOTTFRIED AUGUST, one of the most popular German poets, was b. Jan. 1, 1748, at Molmerswende, near Halberstadt, in Prussian Saxony. In his boyhood, he displayed no capacity for hard study, and was particularly averse to Latin; but he at the same time showed a relish for verse, though destitute of any other model than the Psalm-book. In 1764, he went to Halle, and applied himself to theology. In 1768, he abandoned this science for jurisprudence, which he studied at Göttingen. Here his conduct

was careless and immoral, and he would probably have sunk into obscurity, if the intimacy which he happily formed with Voss, the two Stolbergs, and other young poets, had not stirred up his better nature, and inspired him with an earnest ambition to excel. He labored hard at the classics of ancient and modern times, but the study of Shakespeare and Percy's *Reliques* had the greatest influence in deciding the style of poetry which he was to adopt. With regard to the intrinsic merits of his poems, which consist chiefly of ballads and songs, even German critics—such as Schiller, Gervinus, and Vilmar—differ widely in their opinions; but all agree in praising the popular style and fluent, spirited versification of his ballads, *Leonora*, *Leonardo and Blandine*, the *Parson's Daughter of Taubenhayn*, the *Wild Huntsman*, etc. B.'s life was spent in great poverty and misery, partly the result of misfortune, and partly induced by his own errors. He married thrice, in two instances very unhappily; lost his property by an unfortunate speculation; and, though the favorite poet of the German people, was left to earn his bread by translations and similar literary labors. He died June 8, 1794. Though a popular writer, B. was very careful as to style, and was one of the first who wrote good hexameter verse in German. Since 1798, there have been numerous complete and partial editions of his works. See B.'s life by Döring (1826), and by Pröhle (1856).

BÜRGERMEISTER, the German title of the chief magistrate of a city or town, analogous to the French *maire*, the English *mayor*, and the Scotch *provost*.

BURGERSDYK, or **BURGERSDICIUS**, FRANCIS; a Dutch logician, 1590–1629. He was professor of logic and moral philosophy, and afterwards of natural philosophy, at Leyden. His *Logie* was a valuable work; *Idea Philosophiæ Moralis* was a posthumous publication.

BURGES, TRISTAM, LL.D., 1770–1853; b. Mass.; a lawyer, and head of the Rhode Island bar; in 1815, chief justice of the state. In 1816, he was professor of oratory in Brown university; in 1825, elected to congress, where he served ten years. He was a ready, witty, and sarcastic speaker, and had many sharp discussions with the equally ready and sarcastic John Randolph. In 1839, he published *The Battle of Lake Erie, with Notices of Commodore Elliott's Conduct*.

BUR GESS, or **BURGH'ER**, from the same origin as borough, means, when taken in a general sense, much the same thing as the word citizen, but has a variety of special meanings, according to local institutions. In French literature, the word *bourgeois* is generally used to personify the excess of plebeian vulgarity; while, on the other hand, in England, the aristocratic member of parliament for a city is technically called a burges. In almost all parts of Europe, when used in a technical sense, the word means a person who holds some peculiar privilege in a town or municipal corporation. The burgresses of the European towns, indeed, were, and still nominally are, an interesting relic of ancient Roman institutions, existing in contest and rivalry with the institutions of feudality. The B., with a different name, is virtually the civis or citizen of the Roman municipality. It was a rank always of some moment, but especially valuable when the citizenship was of Rome, the metropolis. St. Paul, when he was to be scourged, raised the alarm of the chief captain by stating that he was a Roman. Such an event might often have happened in the middle ages, when a B., brought before the court of a feudal lord claimed the privilege of pleading in his own burgal court, or the king's tribunal. The European monarchs found it their interest to support the burgresses, as a check on the influence of the feudal aristocracy; and thus was nourished the great system of city communities, which have exercised so important an influence on the fate of the world. See MUNICIPALITY.

In the law of England, a B. is a member of the corporation of a corporate town, or he may be described as a freeman duly admitted as a member of the corporate body. This privilege was, and, to some extent, still is, acquired by birth or servitude—that is, by being born of a freeman, or by apprenticeship for seven years within the borough to a freeman. It might also be obtained by gift or purchase; and the municipal corporation act, the 5 and 6 Will. IV. c. 76—with the exception of abolishing the last-mentioned mode of admission by gift or purchase—expressly reserves the rights of such freemen and their families; and it also provides for the making up and preservation of a list of burgresses so admitted, to be called the *freeman's roll* (q.v.). In that act, a burges is defined to be a male person, who, on the last day of Aug. in any year, shall have occupied any house, warehouse, counting-house, or shop within the borough, during that year and the whole of the two preceding years; and during such occupation shall also have been an inhabitant householder within the borough, or within seven miles thereof. As the law now stands, every person of full age (and this includes females) who on the last day of July shall have occupied any house, warehouse, counting-house, shop, or other building within the borough during the whole of the preceding twelve months, and also shall have resided within seven miles of the borough, shall, if duly enrolled, be a burges and member of the body corporate of the mayor, aldermen, and burgresses of such borough, provided he shall have paid his borough rates up to the preceding Jan., and shall not have been in receipt of parochial relief. The premises occupied need not be the same throughout the year if they are within the borough, 35 and 36 Vict. c. 55. See TOWN COUNCIL. The vote is by ballot.

In the Scotch law, the old definition of B. is still maintained. This is very similar

to the old English one above mentioned, with the addition of admission to the privilege *by election of the magistrates of the borough*—the burgesses taking, on the occasion of their admission, a quaint form of oath, in which they confess the religion of the country, loyalty to the queen, to the provost and bailies of the burgh and their officers, and declaring *inter alia*, that they will “make concord where discord is, to the utmost of their power.” By the Scotch municipal reform act, 3 and 4 Will. IV. c. 76, s. 14, it was enacted that councilors must be entered burgesses of the burgh before their induction, but now, any councilor is at once made a B. by minute of council. One of the peculiar privileges of a B. in Scotland, that of his heir having a right to *heirship movables*, was abolished by the statute 31 and 32 Vict. c. 101, s. 160, titles to land (Scotland) act. An act assimilating the law of Scotland to that of England respecting the creation of burgesses was passed in 1876.

BURGESS, DANIEL, D.D., 1645–1712; an English dissenting divine, who openly avowed Presbyterian principles, and, in Ireland, frequently preached in defiance of the severe laws against non-conformity. He was imprisoned, and upon release went to London, where he soon gathered a large congregation by ardent zeal and the witty and ludicrous illustrations he used in his sermons. He was tutor of Henry St. John, afterwards lord Bolingbroke.

BURGESS, GEORGE, D.D., 1809–66; b. R. I.; graduate of Brown university and tutor therein, afterwards studying in Germany. In 1834, he was rector of an Episcopal church in Hartford, Conn., and in 1847 became bishop of Maine, officiating also as rector of a church in Gardiner. He published *The Last Enemy Conquering and Conquered*; *Sermons on the Christian Life*; and a metrical version of a portion of the Psalms.

BURGESS LIST AND BURGESS ROLL are lists made under the provisions of the municipal corporation act, 5 and 6 Will. IV. c. 76, amended by 20 and 21 Vict. c. 50, and 32 and 33 Vict. c. 55. The overseers of the poor of every parish wholly or in part within any borough, are directed to make out an alphabetical list, called the *burgess list*, of all persons who may be entitled or qualified to be enrolled on the burgess roll of that year, such list to be open for perusal by any person, without the payment of any fee, at all reasonable hours, between the 1st (when the list must be signed and delivered) and 15th days of Sept. in every year. This list is afterwards revised by the revising barrister, and the names of those persons allowed, on revision, to remain, are then transferred to the *burgess roll*, which is copied into a general alphabetical list in a book provided for that purpose by the town-clerk or clerk of the peace, and which book must be completed on or before the 22d of Oct. in every year; every such book being the burgess roll of the burgesses entitled to vote for councilors, assessors, and auditors of the borough. Copies of such burgess roll, so completed, shall be made in writing, or printed, for delivery and sale to all persons applying for the same, on payment of a reasonable price for each copy. There are other regulations respecting these lists, and with respect to neglect and informality in making up the burgess roll. Every person of full age, who occupies a house, warehouse, counting-house, shop, or other building within the borough for twelve months, and resident in or within seven miles, shall, if duly enrolled, be a burgess, 32 and 33 Vict. c. 55.

In regard to Scotland, it has been already explained (see BURGESS), that persons entitled to the privileges of burgesses must be admitted according to the old form, and councilors, before induction, may, by a minute of council, be made burgesses, 23 and 24 Vict. c. 47. But the list, which corresponds to the English burgess roll, is the list of municipal *electors* qualified according to the provisions of the 3 and 4 Will. IV. cc. 76, 77; 31 and 32 Vict. c. 108; and 33 and 34 Vict. c. 92, relating to royal burghs in Scotland.

BURGH is a descriptive name of towns and cities in Scotland, corresponding to the English word *borough* (q.v.). There were *burghs of barony*, *free burghs*, *burghs of regality*, and *royal burghs*. Since 1832, there have been what are called *parliamentary burghs*—that is, towns or burghs not being royal burghs, but sending or contributing to send representatives to parliament, under the act 2 and 3 Will. IV. c. 65. By the general police act for Scotland, the word B. was declared to mean also any populous place, the boundaries of which are fixed by the act. Among parliamentary burghs are Paisley, Greenock, Leith, Kilmarnock, Falkirk, Hamilton, Peterhead, etc.; and by the 3 and 4 Will. IV. c. 77, 15 and 16 Vict. c. 32, 16 and 17 Vict. c. 26, 31 and 32 Vict. c. 108, 33 and 34 Vict. c. 92, 35 and 36 Vict. c. 33, a code is given for the election of their magistrates and councilors, and for the appointment of other officers; the election being with the persons qualified to vote for a member of parliament—to be concluded in Paisley, Greenock, Leith, and Kilmarnock, by open poll in one day, the polling-books to be summed up, and the result declared by the provost: in Falkirk, Hamilton, Musselburgh, Airdrie, Port-Glasgow, Peterhead, Portobello, Cromarty, and Oban, to be by signed lists: a third of the council to go out, and others to be elected every year; and the provost and magistrates to be chosen by the council from their own number.

The police of burghs, and everything regarding their draining, cleaning, lighting, etc., are regulated by the police (Scotland) act, 20 and 21 Vict. c. 72, and the public health (Scotland) act, 30 and 31 Vict. c. 101.

BURGHs OF BARONY are corporations consisting of the inhabitants of determinate tracts of ground within the *barony* (q.v.), and municipally governed by magistrates, whose election is either dependent on the baron or lord of the district, or vested in the inhabitants themselves. Sometimes their charter of incorporation gave them power to create subordinate corporations and crafts, as in royal burghs; but all exclusive privileges of trading in burghs are abolished by the 9 and 10 Vict. c. 17. In other respects, the general corporate law of the country applies to burghs of barony. They have power to administer their common good, to elect their burgh officers, to make by-laws, and their burghesses are entitled to challenge the sale or other disposition of the burgh's property.

BURGHs, FREE, were burghs of barony enfranchised by crown charter with rights of trade both home and foreign, but subjected, at the same time, to the same class of public burdens and taxation which royal burghs had to bear as the price of their peculiar privileges. Since the gradual decay and ultimate suppression of commercial monopoly, this class of burghs has become extinct, or rather *all* burghs may now be said to be *free*.

BURGHs OF REGALITY were burghs of baronies, spiritual or temporal, enfranchised by crown charter, with regal or exclusive criminal jurisdiction within their own territories, and thence called *regalities* (q.v.). Some of these burghs of regality, especially those which were dependent on the greater bishops and abbots, were of high antiquity, and possessed jurisdiction and privilege of trade only distinguishable from those of royal burghs, by being more circumscribed in their limits. Since the abolition of hereditary jurisdictions by the act 20 Geo. II. c. 43, the distinction between burghs of regality and burghs of barony have ceased to be of any practical importance.

BURGHs, ROYAL. A royal burgh is a corporate body deriving its existence, constitution, and rights, from a royal charter—such charter being either actual and express, or presumed to have existed, and by the accident of war and time, to have perished. By a Scotch act passed in 1469, a constitution was given to royal burghs, by which the right of appointing their successors belonged to the old councils, the act also containing the singular provision, that when the new council was chosen, the members of it, *along with those of the old council*, should choose all the office-bearers of the burgh, each craft or trade corporation being represented at the election by one of themselves. But this simple plan was not universally adopted, and the election gradually lost its former free and popular form—a close and exclusive proceeding being ultimately established in its place. This "close system," as it has been called, notwithstanding its repugnancy to the spirit of the times, and modern ideas of public administration, continued in force until the year 1833, when an act of parliament was passed, the 3 and 4 Will. IV. c. 76, amended by the 4 and 5 Will. IV. c. 87, and the 16 Vict. c. 26, by which it was abolished, and an entirely new constitution given to royal burghs, with the exception of nine of them, which, on account of the smallness of their population, were left unchanged till the passing of the municipal elections amendment act (Scotland) in 1868. These nine burghs were: *Dornoch, New Galloway, Culross, Lochmaben, Bervie, Wester Austruther, Kilrenny, Kinghorn, and Kintore*. Of the other royal burghs, being those to which the reforming acts apply, the principal are—**EDINBURGH**, *Glasgow, Aberdeen, Dundee, Perth, Dunfermline, Dumfries, and Inverness*. The leading provisions of these acts are as follows: All persons within the burgh qualified under the parliamentary reform act, 2 and 3 Will. IV. c. 65, in respect of property or occupancy of premises, and who have resided for six months next previous to the last day of June, within the royalty, or within 7 m. of it, are entitled to vote in the election of councilors. In such burghs as do not now send members to parliament, property of the same value is required for the qualification, and claims for this privilege must be lodged with the town-clerk on or before the 21st of July, in a particular form. The councilors are chosen from among the electors residing, or personally carrying on business, within the royalty; and where there is a body of burghesses in the burgh, each councilor, before his induction, must be entered a burghess—a requisite clearly unnecessary for the purposes of the municipal administration contemplated by the act, and which, it is expected, will be done away. The number of councilors in each burgh is such as, by the *sett* or constitution existing at the passing of the act, formed the common council, or, where this was variable, the smallest number making a full council. The electors of Edinburgh, Glasgow, Aberdeen, Dundee, Perth, Dunfermline, Dumfries, and Inverness, are divided into wards or districts. At the election immediately succeeding the passing of the act, each ward elected six councilors; but as every year the third part of the council goes out of office, in the order prescribed by the act, two councilors are now annually chosen by each ward, there being no bar, however, to the re-election of an outgoing councilor. The electors in other burghs choose the whole council exactly as these wards do their proportion of it, and consequently elect each year a third part in place of that which has retired. Upon the third lawful day after the election succeeding the passing of the act, the councilors meet and choose, by a plurality of voices, a provost, bailies, treasurer, and other office-bearers, as existing in the council by the *sett* or usage of the burgh; and vacancies occurring among such office-bearers, in consequence of the annual retirement of the third part of the council, are directed to be supplied from the councilors in like manner, as soon as the election of the new third has taken place, the first attending magistrate having a casting vote in cases of equality. Vacancies taking place during the year by death or resignation are supplied, *ad interim*,

by the remaining members of the council, and the persons so elected by the councilors retire at the succeeding election. The rights of the guildry, trades, etc., to elect their own dean or guild, etc., are still preserved; but they are now no longer recognized as official or constituent members of the council, their functions being performed by a member of the council, elected by a majority of the councilors. In Aberdeen, Dundee, and Perth, however, the dean of guild, and in Edinburgh and Glasgow, the convener of trades and the dean of guild, are, *ex officio*, members of council; and the electors in all the above-named burghs choose such a number of councilors as, together with these officers, makes up the proper number. No magistrate or councilor can be town-clerk. The magistrates and council possess the same powers of administration and jurisdiction as were enjoyed by the magistrates and town-council before the passing of the act; and none of them is responsible for the debts of the burgh, or the acts of his predecessors, otherwise than as a citizen or burghess. The existing council in all burghs royal must every year make up, on or before the 15th of Oct., a state of their affairs, to be kept in the town-clerk's or treasurer's office.

The police of burghs and other populous places, and the paving, draining, cleansing, lighting, and improving the same, are regulated by the 25 and 26 Vict. c. 101, which repeals several previous acts. In this act "burgh" is defined to mean all burghs and populous places whose boundaries have been fixed; and it is provided that the sheriff may fix the boundaries and so constitute a burgh in this sense, for purposes of improvement and police, at the instance of seven or more householders.

BURGH ACRES are acres or small patches of land lying in the neighborhood of *royal burghs* (q.v.), usually feued or leased out to burghesses or persons resident within the burgh. A Scotch act of parliament, passed in 1695, relating to the division or partition of lands lying runrig, excepts burgh acres, or, as the act calls them, "burrow and incorporat acres," from its provisions; but this is to be understood only of royal burghs, and not of burghs of barony or others.

BURGHERS, a name popularly given to a religious denomination in Scotland. See UNITED PRESBYTERIAN CHURCH.

BURGH, CONVENTION OF. See CONVENTION OF ROYAL BURGHES.

BURGMAYER, HANS, a noted old German painter and wood-engraver, was b. at Augsburg, 1473. He was the father-in-law of the elder Holbein, and the friend of Albert Dürer, whose influence is manifest in B.'s works. Several excellent paintings by B. are preserved in the galleries of Munich, Berlin, Augsburg, and Vienna. But he is best known as a wood-engraver; his cuts amounting in all to nearly 700. Among the most celebrated of these is his "Triumph of the Emperor Maximilian," in 135 cuts, with a description by the emperor himself. Another fine series of 237 cuts, called "The Wise King," represents the deeds of Maximilian. B. is supposed to have died about the year 1559.

BURGLARY (through the old Fr. from Lat. *burgi latro*, a robber of a burg or inclosure), in the criminal law of England, is defined to be a breaking and entering the mansion-house of another in the night, with intent to commit some felony within the same, whether such intent be executed or not. It is peculiar to this crime, that it can only be committed in the *night-time*, which, by the 24 and 25 Vict. c. 96, s. 51, is considered as commencing at nine in the evening, and concluding at six in the morning of the next day. The next requisite of the crime, according to the definition we have given, relates to the *place* of its commission. It must be in a *mansion-house*, for such is the technical expression; but this is construed to mean any private dwelling, or any building temporarily or permanently used for that purpose. It cannot be committed in a distant barn, warehouse, or the like, unless there be a communication with the dwelling-house, nor in a house where no one resides. But it is B. to break into a house which is used as an occasional residence, and which the owner is in the habit of leaving for a short period, with the intention of returning, even although no one be in the house at the time of the offense. A chamber in a college, or an inn of court, is also within the meaning of a mansion-house; so likewise is a room or lodging in any private house, if the owner and the lodger enter by different outer doors; but if they both enter by one outer door, then the house is described as that of the owner. For the same reason, a building belonging to a corporation, and separately inhabited by the officers of the body corporate, is the mansion-house of the corporation, and not of the officers. Again, a shop which is part of another man's house, and hired merely for the purpose of work or trade, is not a dwelling-house, but B. may also by express enactment be committed in it, though the punishment is not quite so severe. This offense cannot be committed in a tent or booth erected in a market or fair, though the owner may lodge therein, for his doing so makes it no more B. to break open such an erection, than it would be to uncover a tilted wagon under the same circumstances. But it may be committed by breaking open a church, which, according to sir Edward Coke, is *domus mansionalis Dei*, that is, the mansion-house of God, and is now expressly protected.

As to the *manner* of committing B., it is laid down by Blackstone that there must be both a breaking and an entry to complete it. There must, in general, be an actual breaking, a substantial and forcible irruption—as, at least, by breaking, or taking out

the glass of, or otherwise opening a window; picking a lock, or opening it with a key; nay, by lifting up the latch of a door, or unloosening any other fastening. But if a person leaves his doors or windows open, it is his own folly and negligence, and if a man enters therein, it is no B.; yet if he afterwards unlocks an inner or chamber door, it is so. To come down a chimney is held a burglarious entry, for that is as much closed as the nature of things will admit; so also to knock at a door, and upon its being opened, to rush in with a felonious intent; or, under pretense of taking lodgings, to fall upon the landlord, and rob him. If the servant conspires with a robber, and lets him into the house by night, this is B. in both.

The *intent* must also appear, otherwise the offense will amount only to a trespass; and it must be an intent to commit felony, which may be inferred from the conduct of the offender while in the house.

The punishment for this crime is now regulated by the act 24 and 25 Vict. c. 96, called the larceny consolidation act. The provisions are to the effect, that any one convicted of B. shall be liable to penal servitude for life, or any term not less than five years, or to be imprisoned for any term not more than two years; and in the case of imprisonment, hard labor and solitary confinement may be superadded. It is further enacted, that whosoever shall burglariously break and enter into any dwelling-house, and shall assault with intent to murder any person being therein; or shall stab, cut, wound, beat, or strike any such person, shall be guilty of felony, and suffer penal servitude for five to seven years, or two years' imprisonment and hard labor. And by the same statute, section 58, it is enacted that any person found *by night*, armed with any dangerous or offensive weapon or instrument, or with housebreaking implements, or with face blackened or disguised, with intent to enter any buildings, and to commit felony therein; or if he be found by night in any building with intent to commit a felony therein—is liable to penal servitude for five years, or imprisonment not exceeding two years; and in case of a second conviction, is liable either to such imprisonment or to penal servitude for a period not less than five years, and not exceeding ten years.

Blackstone observes, that this offense was anciently called *hamesecken*, as, he adds, it is in Scotland to this day. But the Scotch law on this subject has some points of difference—*hamesecken*, or *hamesucken*, as it is spelled in the Scotch books, not being quite identical with B.: thus, the former is an offense exclusively against the *person*, and it may be committed in the daytime as well as at night; and there are other points of dissimilarity. The Scotch law relating to *housebreaking* and *stouthrief* affords analogies. See HAMSUCKEN, HOUSEBREAKING, STOUTHRIEF, LARCENY, ROBBERY, ASSAULT.

BURGLEN, a village of Switzerland, in the canton of Uri, about 2 m. from Altorf. It is celebrated as the birthplace of William Tell. The supposed site of the patriot's house is now occupied by a chapel, upon the walls of which are represented certain well-known scenes from his history. Pop. '71, 1391.

BURGOMASTER. See GULL.

BURGOS, a city of Spain, capital of the new province of the same name, and of the former kingdom of Old Castile, is situated in a fertile valley at the foot of the Sierra d'Oca, and on the right bank of the river Arlanzon, in lat. 42° 20' n., and long. 3° 45' w. Pop. 25,700. B. is a very ancient place, having been founded in 844. Many of the gloomy old houses of its early history still remain. In the castle of B., Edward I. of England was married to Eleanor of Castile. The cathedral of B., founded in 1221, is one of the noblest specimens of Gothic architecture in Spain. Its various chapels are rich in fine sculpture and tombs. It was the birthplace of the Cid (q.v.). B. has manufactures of woolens, linens, and hats, but it depends chiefly on the traffic which its position on the great road from France and the northern Spanish provinces to Madrid secures it. B. has several charitable and educational institutions. It formerly had a much larger population—as many as 50,000—but on the removal of the court to Madrid in the 16th c., B. began to decline in population and importance. It was further greatly injured in Nov., 1808, by the French, who sacked it. In 1812, the castle was four times unsuccessfully besieged by Wellington, who, however, took it in the following year, when the French blew it up, as well as the fortifications.—The province of B. has an area of 5650 sq.m., and a pop., in 1870, of 353,560. The surface is elevated, the soil fertile, yielding grain and fruits. The hills afford rich pasturage; and the minerals gold, silver, iron, lead, and copper are found.

BURGOYNE, JOHN, a British general and dramatist, natural son of lord Bingley, early entered the army, and in Aug., 1759, was appointed lieut.col. commandant of the 16th light dragoons. In 1761, he served at Belle Isle, and in 1762 commanded a force sent into Portugal for the defense of that kingdom against the Spaniards, when he surprised and captured Alcantara. In 1776, he served in North America, and in the summer of 1777 he was appointed to the command of a large force ordered to penetrate from Canada into the rebellious districts. The early part of the expedition was marked by his capture of Ticonderoga; but neglecting to preserve his communications with Canada, he encountered the greatest difficulties, and was at last obliged to surrender with his army to gen. Gates, at Saratoga. Soon after his return to England, having been denied an audience of the king, and refused a court-martial, he went over to the opposition party, and voluntarily resigned all his appointments. On a change of ministry, at the close of

the American war, he was appointed commander-in-chief in Ireland. This office he resigned two years after, and subsequently seems to have devoted his time to light literature. He was the author of some pamphlets in defense of his conduct, and of *The Maid of the Oaks* (1780); *The Heiress* (1786); and other stock dramatic pieces. B. was one of the managers for conducting the impeachment of Warren Hastings. He died in 1792. See *Episodes from the Life and Letters of B.*, by Barrington and Fonblanque (1876).

BURGOYNE, Sir JOHN FOX, Bart., an eminent engineer-officer, b. in 1782, entered the royal engineers in 1798. From 1800 to 1807, he served in the Mediterranean; was with Moore at Carunna in 1809; and served under sir Arthur Wellesley in the peninsula till the conclusion of the war in 1814, being present at all its sieges. In 1814, he was commanding engineer of the expedition to New Orleans, and in 1826 of that sent to Portugal. In 1851, he obtained the rank of lieut. gen., and in 1854 was made D.C.L. of Oxford university. In the Crimean war, he was chief of the engineering department of the British army till recalled in 1855. For his services at Sebastopol, he received from the sultan the order of the Medjidie, and from the French emperor that of grand officer of the legion of honor. He was made gen. in 1855, and created a baronet in 1856. He died 7th Oct., 1871.

BURGUNDY, the name of a once independent kingdom of wide extent, but most frequently used of an old French province (Fr. *Bourgogne*) now divided between the departments of Côte-d'Or, Saone-et-Loire, and Yonne. The ancient Burgundians (*Burgundi* or *Burgundiones*), originally a German tribe, were at first settled on the banks of the Oder and the Vistula, and afterwards extended themselves to the Rhine and the Neckar, and, in 407, penetrated into Roman Gaul. Their conversion to Christianity took place in the course of eight days! They adopted a brief Arian confession of faith, and were baptized. From 407 to 534, the kingdom of B. was several times divided; and in 451, Gundicar, king of B., with 10,000 men, confronted Attila, but was defeated and slain.

In 534, B. passed under the rule of the Franks; but the weak government of the later Carolingian kings allowed a part of it once more to assert a separate existence as a dependency of the empire under Boso of Vienne in 832. Boso's realm, known as Cisjuran B., or the kingdom of Arles (Arles), lay mainly in the basin of the Rhone. A second Burgundian state arose about the same time in the country between the Saone and the Reuss, and was known as Transjuran or Upper Burgundy. These states, united in 930, were for a time powerful and famous; but in 1038, on the extinction of the royal dynasty, B. became part of the German empire. It was afterwards broken into several fragments, which were gradually absorbed by France.

A similar fate befell the third Burgundian state, the dukedom of B. or Lower B., which was formed by a brother of Boso. Yet the dukes of B. played a large part in the history of mediæval Europe, and were long the dangerous rivals of the French kings. The nucleus of the dukedom was in Lower B., the region which afterwards became the French province of B., to the n. and w. of the other Burgundian realms; but the second line of dukes, beginning in 1363 with Philip the hardy, son of the French king John, held under their sway not only Franche Comté and adjoining portions of France proper, but great part of the Low Countries. Charles the bold (q. v.) was one of the most powerful sovereigns of Europe. Louis XI. of France succeeded in incorporating the duchy with the kingdom of France.

BURGUNDY, LOUIS, Duke of, the grandson of Louis XIV. of France, and dauphin of France after the death of his father, was b. at Versailles in 1682. Even in childhood he was ungovernable, and became excessively violent and haughty, and abandoned to all gross and sensual passions. Although educated under the care of the abbé Fénelon, he used, when 30 years of age, to divert himself with drowning flies in oil, and blowing up living frogs with gunpowder. He had the misfortune to be deformed; his deportment and manners were undignified, and his mind was imbued with bigotry. When only about 15 years of age, he was married to the princess Adelaide of Savoy, and spent his time wholly in amusements in the company of his spouse, and of the ladies of the court. Nevertheless, in 1701, he was nominally appointed generalissimo of the army, really under the command of the duke de Vendôme, and is said to have shown some spirit in a cavalry-fight at Nimeguen; but he quarrelled with Vendôme, chiefly because he had once been compelled to establish his head-quarters in a nunnery. He lost the respect of the army, and was exposed to many humiliations, partly proceeding from intrigues set on foot against him out of envy by his father. He returned to the court more eccentric, gloomy, and unsociable than before. But when he became, on his father's death, the second person in the kingdom, all his defects vanished from the sight of the courtiers, and flattery bestowed on him the title of the great dauphin. He died suddenly in the year 1712. A few days previously, his wife and her son, the duke of Bretagne, had died, and the same hearse carried father, mother, and child to St. Denis. The duke of Orleans, subsequently regent, and his daughter, the duchess of Berri, were accused, but without reason, of having caused them to be poisoned.

BURGUNDY PITCH, a resinous substance prepared from common frankincense (q. v.), the spontaneous exudation of the Norway spruce-fir (*abies excelsa*; see FIR) by melting it in hot water, by which means it is freed from a considerable part of the volatile oil which it contains. By straining it through a coarse cloth, impurities are also removed.

B. P. is of a yellowish-white color, hard and brittle when cold, but softening by the heat of the hand, and readily adhering to the skin. It has a not unpleasant resinous odor, and a slightly bitter taste. It is used in medicine as an external application only, and generally acts as a mild irritant. A very common application of it is as a plaster in complaints of the chest, and in rheumatic complaints. It enters also as an ingredient with resin, oils, etc., into a compound plaster of similar use. The B. P. of commerce is now principally brought from Hamburg; but the greater part of what is sold under that name is really manufactured of common resin and palm-oil, or from American turpentine. It has a fuller yellow color than the genuine B. P., and a less agreeable odor.

BURGUNDY WINES are chiefly the produce of vineyards cultivated on the hilly lands forming the Côte d'Or, between Dijon and Chalons. These hills average about from 800 to 1000 ft. in height; the vineyards ascend up the slopes in terraces, and spread along the table-land on the summit. "In richness of flavor and in perfume, and all the more delicate qualities of the juice of the grape, the wines grown here unquestionably rank as the finest in the world." The most celebrated of the *red* wines of Burgundy are the Closvougéot (near Beaune), Nuits, Chambertin (the favorite wine of Louis XIV. as well as of Napoleon), the Romané-Conti, Richebourg, Volnay, and Pomard. Of other red wines of Burgundy not grown on the Côte d'Or, those of Pitois, Perrière, Preaux, and Auxerre are held in most repute. The *white* wines of Burgundy are also the finest in France, but being produced in less quantity, they have less celebrity. The quantity of wine annually produced in Burgundy averages 3,500,000 hectoliters (77,000,000 gallons), of which only about a fifth is consumed in the district.

BURHÁNPUR, a t. in British India, 280 m. n.e. of Bombay, 21° 31' n., and 76° 20' e.; 2 m. from the railway station of Lalbagh. It was founded in 1400, and was the chief seat of the government of the Deccan provinces of the Mogul empire until 1635. In 1861, it was ceded to the British government. Pop. '72, 29,303. B. is celebrated for its muslins, flowered silks, and brocades.

BURHAUNPUR, a large t. of India, in the territory of Gwalior, or possessions of Scindia's family, on the right bank of the Tapti, in n. lat. 21° 18', e. long. 76° 20', 280 m. n.e. from Bombay. The banks of the Tapti are here bold, rising 60 or 70 ft. above the stream. The town is surrounded by a rampart of brickwork, and contains a palace built by Akbar. A few of the wealthier merchants have good houses, built of teak, and profusely decorated with carvings. The most wealthy and influential are the Borahs, a Mohammedan tribe, who inhabit a distinct ward, which they shut up at night, excluding all other persons. There are manufactures of muslins, flowered silks, and brocades, for which the place was formerly famous, so that, in the 17th c., they were exported in great quantities to Persia, Egypt, Russia, and Poland.

BURIAL, a word of Teut. origin (Ang.-Sax. *birgan*, to conceal), is applied to the prevalent method among civilized nations of disposing of the dead, by hiding them in the earth. As there is almost nothing else so deeply interesting to the living as the disposal of those whom they have loved and lost, so there is perhaps nothing else so distinctive of the condition and character of a people as the method in which they treat their dead. Hence, funeral customs associate themselves with a wide variety of sentiments, from gentle and rational sorrow, up to deification of the departed, accompanied sometimes with cruelty and ferocity towards the living. People of a low and barbarous type carelessly permit the remains of the dead to lie in the way of the living, and there are a few instances in which the object of artificial arrangements has been to preserve a decorated portion of the body—as, for instance, a gilded skull—among survivors. The general tendency of mankind, however, has always been to bury the dead out of sight of the living; and various as the methods of accomplishing this end have been, they have resolved themselves into three great classifications: 1. The simple closing up of the body in earth or stone; 2. The burning of the body, and the entombing of the cinders; and, 3. The embalming of the body. The first of these seems to be the earliest form of which we have any record, and it is the form most amply sanctioned by the existing practice of the civilized world. It is the method referred to in the earliest scriptures; and all are familiar with the touching scene in which Abraham buries Sarah in the cave in the land of Canaan which belonged to Ephron, but was, after a solemn and courteous negotiation, secured to Abraham for a possession to bury his dead in (Gen. c. 23). The horrible fate of being left unburied, either from scorn or neglect, is powerfully told in the prophecy of Jeremiah against Jehoiakim: "He shall be buried with the burial of an ass, drawn and cast forth beyond the gates of Jerusalem." There is frequent allusion in the later scriptures, and especially in the New Testament, to the embalming of the body in antiseptics and fragrant substances; and the burning of the bodies of Saul and his sons is accounted for by commentators on the supposition that they were too far decayed to be embalmed. The Israelites may have learned the practice of embalming from the Egyptians, among whom it was an art so greatly cultivated and extensively practiced, that Egyptian corpses, as inoffensive as any article of wood or stone, are scattered over Europe in museums, and are even to be found as curiosities in private houses. The soil and climate of upper Egypt seem to have afforded facilities for

embalming unmatched in any other part of the world; and in other places the vestiges of the practice are comparatively rare, though it is usual even yet to embalm royal corpses, and in some places to preserve a series of mummies, as in the vault of the monastery of Kreuzberg, at Bonn, where the monks have been successively preserved in their costume for centuries. The practice of incineration, or of the burning of the body, and the entombing of the ashes, deserves more inquiry than it has yet obtained. In Greece, in Etruria—both before and after it came under the Romans—and in the n. of Europe, the simple burial of the body, and its prior reduction to ashes, were both practiced, and sometimes contemporaneously. The tombs of Etruria are rich in art, much of it going to the adornment of the urns of baked clay in which the ashes of the dead are kept. Vessel of *terra-cotta*, or cooked earth, containing human remains, have been found, often so large that they appear to have served as coffins for containing the whole body. Vessels of this kind were found in the valley of the Scamander by some British officers while spending their leisure time after the siege of Sebastopol, upon the ground supposed to have been occupied by the besiegers of Troy. Smaller cinerary urns have been found over so extensive a portion of the world, that it is difficult to define the limits to which they belong. The Danish antiquaries say, that in their stone period, when the use of metals was unknown, the dead were all buried unburned in stone chambers, and that the burning of the bodies and the preservation of the ashes in urns came in with the age of bronze. These antiquaries associate with the older system those amorphous mounds of earth or stone called barrows or tumuli, which are to be found all over the n. of Europe. Mr. Bremner, in traveling among the steppes of the Ukraine, saw multitudes of these small mounds, which reminded him at once of what he had seen on the plain of Troy, at Upsala in Sweden, in Scotland, and in Ireland. The Irish tumulus of New Grange is perhaps the most remarkable of all, forming a connecting link between the simple barrow on the moor and the pyramids of Egypt, which are the perfection of the same kind of structure applied to the same purpose—the burial of the distinguished dead. These structures open up a large field of curious inquiry. The simple theory, that they were raised over the dead, has lately been disturbed by the discovery that many of them are not artificial, but relics of sheets of alluvial matter, the mass of which has been carried away; and even in these, human remains have been found, the natural mounds having been used as monuments. Even when human remains are connected with barrows, cromlechs, or the large shapeless pillars commonly called Druidical, it is often questionable whether the monument was made to receive such remains. It is certainly ascertained to have been a practice in ancient times to bury bodies in tombs which were themselves ancient when they received their inmates.

Some of the grandest buildings in the world have been tombs; such are the pyramids, the castle of St. Angelo, the tomb of Cæcilia Metella, and many temples scattered over Hindustan and other eastern countries. Thus, the respect paid by the living to the dead has preserved for the world many magnificent fruits of architectural genius and labor. A notion that the dead may require the things they have been fond of in life, has also preserved to the existing world many relics of the customs of past ages. The tombs of Egypt have supplied an immense quantity of them, which have taught the present age more of the manners of ancient nations than all the learned books that have been written. It is an awful remembrance, at the same time, that inanimate things were not all that the dead were expected to take with them. Herodotus tells us of favorite horses and slaves sacrificed at the holocaust of the dead chief. The same thing has been done in our own day in Ashantee. In many countries, the wives had the doom, or privilege, as it was thought, of departing with their husbands; and down to the present generation the practice has lived in full vigor in the Hindu suttis. Among the Jews, the Greeks, the Romans, and many ancient nations, the dead were buried beyond the towns. The "stop, traveler!" was a usual memorandum on Roman tombs. In Christian countries, if the remains of the saint to whom a church was dedicated could be obtained—or any thing passing for the remains—they were buried near the altar in the choir. It became a prevalent desire to be buried near these saints, and the bodies of men eminent for their piety, or high in rank, came thus to be buried in churches. The extension of the practice was the origin of churchyards. These, in crowded towns, became offensive and unhealthy. It can scarcely be said that this practice, so detrimental to the public health, as the B. within churches, was checked in this country until the whole system of intramural interment, as it was called, was attacked, about the year 1844, by Mr. Chadwick and other sanitary reformers. Measures were afterwards carried for shutting graveyards in crowded cities, and placing interments in open cemeteries under sanitary control. The first great measure was passed in 1850, when the board of health was made a B. board for the metropolis, and power was given to the privy council to close the city graveyards. The act was modified two years afterwards, by transferring the duties of managing cemeteries to local boards appointed by the vestries. It was in London that the danger was most urgent and the remedy immediate. It was extended to the English provinces in 1853, and to Scotland in 1855.

In England, B. in some part of the parish churchyard is a common law right, which may be enforced by mandamus—that is, every person may be buried in the parish where he dies. But the body of a parishioner cannot be interred in an iron coffin

or vault, or even in any particular part of a churchyard, as, for instance, the family vault, without an additional fee.

The fact that the only religious service which can at present be conducted at the grave is that of the church of England, has led of late years to the repeated proposal in parliament of measures to permit dissenters to have their own services performed in the churchyard—as yet without results.

By the canons of the church of England, clergymen cannot refuse or delay to bury any corpse that is brought to the church or churchyard; on the other hand, a conspiracy to prevent a B. is an indictable offense, and so is the willfully obstructing a clergyman in reading the B. service in a parish church. It is a popular error, that a creditor can arrest or detain the body of a deceased debtor; and the doing such an act is indictable as a misdemeanor. It is also an error, that permitting a funeral procession to pass over private grounds creates a public right of way. By the 3 Geo. IV. c. 126, s. 32, the inhabitants of any parish, township, or place, when going to or returning from attending funerals of persons in England who have died and are to be buried there, are exempted from any toll within these limits. And by the 4 Geo. IV. c. 49, s. 36, the same regulation is extended to Scotland; the only difference being, that in the latter case the limitation of the district is described by the word *parish* alone. The 6 and 7 Will. IV. c. 86 regulates the registry of deaths. The 4 Geo. IV. c. 52 abolished the barbarous mode of burying persons found *felo de se*, and directs that their B. shall take place, without any marks of ignominy, privately in the parish churchyard, between the hours of nine and twelve at night, under the direction of the coroner. The B. of dead bodies cast on shore is enforced by 48 Geo. III. c. 75. See Wharton's *Law Lexicon*.

In Scotland, the right of B. in a churchyard is an incident of property in the parish; but it is a mere right of B., and there is not necessarily any corresponding ownership in the *solum* or ground of the churchyard. In Edinburgh, however, the right to special B. places in churchyards is recognized.—For B. in cemeteries in England and Scotland, see CEMETERY.

BURIAL ACTS. These are the 15 and 16 Vict. c. 85, for London; the 16 and 17 Vict. c. 134, the 17 and 18 Vict. c. 87, and the 18 and 19 Vict. cc. 79 and 128, for places in England beyond the limits of the metropolis—all as amended by the 20 and 21 Vict. c. 81, and the 22 Vict. c. 1, 23 and 24 Vict. c. 64, 25 and 26 Vict. c. 100, 34 and 35 Vict. c. 33. These acts were rendered necessary when it was resolved on sanitary grounds to put a stop to burials in populous places, which could only be effectually done by giving power to parishes to acquire other burial-grounds in rural places. These statutes have long been proverbial for their confusion (e.g., 20 and 21 Vict., which proposes in the preamble to amend 18 and 19 Vict. c. 78, really amends c. 79), and relate to the appointment of burial-boards for parishes—the authorizing new burial-places, proper sanitary regulations, the control by the government and by order in council, and many other details too numerous to specify here. Our readers must be content with our referring them to the acts themselves, or to their lawyers.

The corresponding acts for Scotland are the 18 and 19 Vict. c. 68, amended by the 20 and 21 Vict. c. 42, and 29 and 30 Vict. c. 50.

BURIAL SOCIETIES are friendly societies constituted in the usual manner, and with the express object of supplying a fund for paying the funeral expenses of the members on their death. See FRIENDLY SOCIETIES. It became customary to enter the names, not only of adults, but of children, in such societies. The proceedings of the criminal courts have shown that, in some instances, children on whose lives such an insurance was effected have been killed or allowed to die of neglect, and the alarm created by such instances was enhanced by the discovery that children were frequently insured in more than one society. To obviate this calamitous use of a beneficial arrangement, it was provided that no insurance of a child under six years of age in a burial society should be legal. It was attested to the select committee of the commons on friendly societies in 1849, that the practice of such insurances continued in uncertified societies; and at the same time it was stated on behalf of the friendly societies: "In our long experience with these societies in Liverpool, in which are nearly 100,000 members, approximating to nearly one third of the population of this great town, we have not had one instance of death by violence for the sake of the burial money." In the friendly societies act of 1850, and in subsequent enactments, stringent arrangements for certifying the cause of death have been adopted as a sufficient protection from this crime.

BURIATS, a Mongolian people in the vicinity of lake Baikal. They are scattered in various tribes that take the names of their special localities; and the tribes are subdivided according to kinship. In 1857, the B. numbered about 190,000. They have high cheek-bones, flat noses, and sparse beard on the chin; they shave the head, leaving a cue at the top, like the Chinese. In summer they dress in wool and cotton; in winter in sheep-skins and furs. Rearing cattle is their chief occupation, and some of them possess large herds. A few tribes engage in agriculture, and in 1839 the B. had about 240,000 acres under cultivation. The soil is fertile, and they have an elaborate system of irrigation. Some activity is shown in trapping and fishing. In religion they are mainly Buddhists; their chief lama living at Goose lake. Some are Shamanists, and their sacred spot is the Shamanist stone at the mouth of Angar river. About 10,000 are

Christians. Reading and writing are general among the B., and they have books of their own, translated from the Thibetan. Their language is Mongolian, and in three distinct dialects. The Russians first explored the region in 1631, and after several unimportant contests permanently subdued the B. before the end of the 17th century.

BURIDAN, JEAN, a scholastic metaphysician of the nominalist party, was b. at Bethune, in Artois, in the 14th c., and studied at Paris under Occam, where he also became a teacher of philosophy. The events of his life, as well as the manner of his death, are very obscure. One account states that he was thrown into the Seine by command of Marguerite de Bourgogne, daughter-in-law of Philippe le Bel, whose infidelities he had rebuked. Another, later, but less mythical-looking account, states that B. was driven from France as a disciple of Occam, and fled to Austria, where he founded a school. His elucidations of Aristotle are among his most useful writings. In his *Logie*, his great endeavor was to facilitate the discovery of middle terms for all kinds of syllogisms. The celebrated sophism known to the schoolmen under the name of BURIDAN'S ASS, has been discussed at superfluous length, and with needless ingenuity, by Bayle. It is not at all likely that it was ever adduced by B., but more probably by his adversaries, who wished to ridicule his metaphysical doctrine of *Determinism*—viz., that in every mental and bodily action the will must be determined by something out of itself. The sophism referred to is that if a hungry ass be placed exactly between two bundles of hay of equal size and attractiveness, it must starve, as there is nothing to determine the will of the animal towards either bundle. His chief works are *Summula Dialectica* (Paris, 1487); *Compendium Logicæ* (Venice, 1489; Oxford, 1637); *In Aristotelis Metaphysica* (Paris, 1518).

BURIN, or **GRAVER**, the principal instrument used in copper-engraving, is made of tempered steel, and is of prismatic form, the graving end being ground off obliquely to a sharp point. The style of a master is frequently described by the expressions *soft B.*, *graphic B.*, *brilliant B.*, or whatever other character may belong to it.

BURITI PALM, *Mauritia vinifera*; see MAURITIA; a beautiful palm which grows in great abundance in the swamps of some parts of the n. of Brazil. It is one of the loftiest of palms. Its leaves are fan-shaped, and form a large globular head at the top of the stem. It produces a great number of nuts about the size of a small hen's egg, covered with rhomboidal scales arranged in a spiral manner. Between these scales and the albuminous substance of the nut, there is an oily reddish pulp, which is boiled with sugar, and made into a sweetmeat. An emulsion is also prepared from it, which, when sweetened with sugar, is a very palatable beverage, but if much used, is said to tinge the skin of a yellow color. The juice of the stem also makes a very agreeable drink; but to obtain it, the tree must be cut down, when several holes about 6 in. square, 3 in. deep, and 6 ft. apart, are cut in the trunk with a small axe; and these in a short time are filled with a reddish-colored liquid, having much the flavor of sweet wine.

BURKE, a co. in e. Georgia, on the Savannah river and the Central Georgia railroad; 1040 sq. m.; pop. '70, 17,639—13,436 colored; in '80, 27,130. Surface hilly, with fertile soil, producing corn, sweet potatoes, and cotton. Co. seat, Waynesborough.

BURKE, a co. in w. North Carolina, on the Catawba river and the Wilmington and North Carolina railroads; 450 sq. m.; pop. '70, 9777—2314 colored. Surface mountainous, with fine scenery; productions agricultural. Co. seat, Morgantown.

BURKE, EDMUND, a philosopher and politician, distinguished over all the men of his times for eloquence and political foresight, was born in 1730, in Dublin, where his father had an extensive practice as an attorney. As a schoolboy, he displayed those traits of character and the germs of those powers which ultimately gave him greatness. In 1744, B. entered the university of Dublin, of which he became a scholar. His undergraduate course was not unmarked by the ordinary distinctions of successful application; but it would appear that he mainly devoted himself to his favorite studies of poetry, oratory, history, and metaphysics. In Feb., 1748, he graduated B.A., and in 1751 took his degree as master of arts. In the interval (1750), being destined for the English bar, he proceeded to London, to keep his terms at the Middle Temple. To legal studies, however, he never took kindly, and ultimately he abandoned the idea of becoming a barrister. During the years 1750—56, he would appear to have occupied himself in traveling through England, enjoying the society of literary men, in study, and finally in writing for various periodicals.

B., when yet at the university, had achieved a local reputation for literary talent and eloquence. Among the compositions of his undergraduate life the most noticeable perhaps is his translation of the conclusion of the second *Georgic* of Virgil, which shows poetic talent of no mean order. His first important publication, however, was the celebrated *Vindication of Natural Society*, written in imitation and ridicule of the style and reasoning of lord Bolingbroke, in which, with well-concealed irony, he confutes his lordship's views of society by a *reductio ad absurdum*. This work, published anonymously in 1756, at the age of 26, attracted considerable attention. Soon after, in the same year, appeared his well-known essay, *A Philosophical Inquiry into the Origin of our Ideas of the Sublime and Beautiful*—a work containing a comprehensive induction of the various sources of the ideas referred to, but which must be pronounced a failure, so far

as it pretends to analyze into their primary elements the emotions of the sublime and beautiful.

The essay on the *Sublime and Beautiful* attained a rapid popularity, and its author soon found himself courted by all the eminent men of his time. Garrick was already one of his friends; among them he soon could count Reynolds, Soame Jenyns, lord Lyttelton, Warburton, Hume, and Dr. Johnson. Notwithstanding this popularity, however, his progress continued slow; for three years yet, he had to occupy himself with periodical writing, devoting his leisure principally to political subjects. What is considered a joint work of B. and his cousin, William Bourke, appeared in 1757—viz., *An Account of the European Settlements in America*—and shows how carefully at this date he had studied the condition of the colonies. In 1761, Mr. W. G. Hamilton ("Single-speech Hamilton"), then secretary for Ireland, having appointed him his private secretary, he returned to Dublin, where, during two years' service, he demonstrated his aptitude for political business, receiving in 1763, in reward of his services, a pension on the Irish establishment of £300, which, however, he did not long enjoy.

Returning to London, B., in 1764, along with Reynolds, founded the literary club, the history of which is associated with almost every considerable name in the literature of the period. But literary society did not call off his attention from the chances of a political career. He became private secretary to the marquis of Rockingham, on his becoming premier, and at the same time entered parliament as member for Wendover. Here his eloquence at once made him the reputation of being "the first man in the commons." The Rockingham administration, however, lived only a few months, and with it terminated this his second political employment. To trace his subsequent career in parliament is more than the limits of this article will allow; it must suffice to state briefly that his parliamentary life extended from 1766 to 1794 without intermission; that he was successively member for Wendover, Bristol, and Malton; twice held the post of paymaster of the forces, once under Rockingham, and again under lord North, with the standing of a privy councillor; that after a career in parliament remarkable for the laboriousness, earnestness, and brilliancy with which every duty was discharged, and extending over nearly 30 years, he retired at last, receiving the thanks of the commons for his numerous public services, and rewarded by government, on the express request of his sovereign, with pensions amounting in all to £3700. It would be wrong, however, to omit that, as paymaster of the forces, he, with a scrupulous regard to public economy, sacrificed all the perquisites of his office, exhibiting a severe integrity unexampled among public men; and that in his relation with the constituency of Bristol, which was alienated from him by his advocacy of the claims of the Roman Catholics and of the opening up of the trade of Ireland, he was the first to maintain the doctrine of the independence of parliamentary representatives—that they are not machines to vote for measures approved by their constituencies simply for that reason, but men and thinkers chosen by them to calmly consider and legislate for the good of the commonwealth. It must also be mentioned, that during his career he rendered more important service to the cause of humanity than any man of his time: he prepared the way for the abolition of the slave-trade, a measure which was destined to ripen to success in the hands of Wilberforce; he advocated the cause of humanity in India against the voracious greed of stockholders, who regarded its millions simply as materials for plunder, and largely contributed to improve the government of that country. Towards America he advocated a policy of justice and conciliation, which, had it been adopted, would have averted the horrors of the war of independence, and retained the colonies in amity with the mother-country. And to the advocacy of every cause which he espoused, he brought a capacity for patient research that was unlimited, and an eloquence that has never been transcended.

Before proceeding to remark on the character and powers of B., a very brief notice must be taken of his leading literary efforts connected with his political labors. Little more than a catalogue can here be given of them. Omitting a variety of valuable letters—several on the condition of Ireland—notice must be taken of his *Observations on a Pamphlet on the Present State of the Nation*, being his first political pamphlet, published in 1769, in answer to one variously ascribed to Fox or Grenville. In 1770, he published a pamphlet, *On the Cause of the Present Discontents*. On the 13th Feb., 1788, he commenced his celebrated speech opening the trial of Warren Hastings (q. v.), the most remarkable trial, perhaps, in the history of the world. This speech lasted over four days, and has been characterized as "a tempest of invective and eloquence." No idea can be conveyed of the effect which it produced. The trial lasted seven years, and closed with another great and splendid oration from B., lasting over nine days. Hastings, it is well known, was acquitted. While this trial was advancing, B. found time to take part in all the current business. In 1790, appeared his *Reflections on the Revolution of France*, which sold in tens of thousands, and is said to have produced an effect never produced before nor since by any political essay. Hereafter, the world showered honors on B., of which space forbids even the enumeration. Having, in 1791, withdrawn from the whigs on the French question, he offered for the consideration of government, *Thoughts on French Affairs*, which, however, was not published till after his death. *Heads for Consideration on the Present State of Affairs* and *Reply to a Noble Lord* next followed, the latter being relative to himself personally. His last work,

Thoughts on a Regicide Peace, showed that he retained to the end of his life his whole powers unimpaired.

Few men have been the subjects of higher panegyric than B., and, on the whole, few have better deserved praise. He was noble-minded, pure in his life, and a purist in politics. Intellectually, he was most richly endowed; with much imagination, rare powers of observation, and indefatigable industry, there was no subject which he could not master, and none which, having mastered, he could not expound with unparalleled richness of language. But with these virtues and powers were conjoined defects, which, without bating their greatness, largely neutralized their influence. He was, it may be said, too literary to be a philosopher, and too philosophic to be a politician. His career would seem to illustrate this position. His oratory astounded by its brilliancy rather than persuaded by its tone and argument; and in the long-run, the eloquence which failed to command the reason, ceased to captivate the ear. The man who at first evoked the enthusiasm of the house by the brilliancy and power of his eloquence, did actually at last empty it by persistence in the monotonous splendors of his speeches. Passionate, and in a great degree untractable, he was unsuited for party politics, and drifted from all his connections, breaking up slowly all party ties, and even the ties of friendship, till he reached at last a state of almost political isolation. At the same time, it must not be forgotten how great an influence he, half philosopher, half politician, exercised on the counsels of the state; many of his views on politics and public economy were anticipations of science, as many of his previsions of the course of events were prophecies.

B. died on the 7th July, 1797, in his 68th year. A collected edition of his works in quarto was published in 1827. The latest edition is that of the Clarendon press, begun in 1866. The best biography of B. is Mr. J. Macknight's. See also Morley's *Edmund Burke, a Historical Study* (1869).

BURKE, SIR JOHN BERNARD, b. 1815; son of John, who started the genealogical books known as *Burke's Peerage*, etc., and continuing the work after the father's death. He was called to the English bar in 1839, and was knighted in 1854. He has published, besides the *Peerage and Baronetage*, *History of Dormant, Abeyant, Forfeited, and Extinct Peerages*; *History of the Landed Gentry*; *Vicissitudes of Families*, and other works.

BURKING. See ANATOMY (in law).

BURLAMAQUI, JEAN JACQUES, a writer on natural law. He was professor and lecturer in Geneva, and was elected to the council of the state. His works are upon the principles of natural and political rights, and have passed through many editions.

BURLEIGH, WILLIAM CECIL, Lord. See CECIL.

BURLEIGH, WILLIAM HENRY, 1812-71; b. Conn.: printer and editor of several literary and religious journals, among which were the *Christian Witness*, Pittsburg, Penn.; the *Charter Oak*, Hartford, Conn.; and the *Washington Banner*. He published a volume of miscellaneous poems.

BURLESON, a co. in central Texas, on Brazos river; 976 sq. m.; pop. '70, 8072-3021 colored. It has an uneven but productive soil, about two thirds covered with oak forests. Productions, corn, cotton, and wool. Co. seat, Caldwell.

BURLESQUE (from Ital. *burla*, jest, mockery), denoting a style of speaking, acting, writing, drawing, is a low and rude grade of the comic. The legitimate comic brings together contrasts with a final view to harmonizing and reconciling them; the B. distorts and caricatures, and brings the incongruities into stronger relief. The farce is the B. of comedy. Deformities and monstrosities that excite disgust do not belong to the burlesque. The lofty and the abject, the great and the little are conjoined, with the sole view of exciting a laugh. Nor does the true B. turn real greatness and nobility into laughter, but only sham greatness—false pathos, and all hollow pretension and affectation. The B. style appears to have been unknown to the ancients; it originated among the Italians, more particularly with the poet Berni (q.v.). The genuinely national *buffone* of the Italians personates the burlesque. Carlo Gozzi, in his tragi-comedies, is perhaps the greatest in the B. vein. Scarron among the French, and *Hudibras* in English, are examples. Parody or travesty (q.v.) is a species of burlesque.

BURLETTA, a comic operetta or musical farce.

BURLINGAME, ANSON, LL.D., 1820-70; b. N. Y.; educated in Michigan and Harvard universities, and practiced law in Boston. He was chosen to the state legislature and the constitutional convention. He was an early worker in the free-soil party when Van Buren was the presidential candidate; and was also a leader in the American party in 1854, and by them sent to congress. His denunciation of Brooks's assault upon senator Sumner provoked a challenge from the South Carolinian, which the Massachusetts member at once accepted, naming rifles as the weapons. Brooks did not fight. Burlingame was a congressman until 1861, and in that year was sent as minister to Austria, where the feeling against him because he had favored Hungarian independence led to a positive refusal to receive him as a diplomatic representative. He was then sent to China, where he was successful in negotiating certain treaties favorable to both countries, and for the first time securing China's recognition of international rights of property, trade, and worship. In 1869, having gained the full confidence of the Chinese

government, he was sent as minister of the Chinese empire to Russia, and other European countries, but died soon after entering upon his duties.

BURLINGTON, a co. in central New Jersey, between the ocean and the Delaware river; 600 sq. m.; pop. '70, 53,639. It is level and in some parts fertile, but much of it is sandy and covered with pine forests. Iron ore, marl, and petrified animal remains are found. Chief productions, cereals, potatoes, hay, butter, and wool. The railways are the Camden and Amboy, Camden and Burlington County, Pemberton and Hightstown, and branches of the New Jersey Southern. Co. seat, Mount Holly.

BURLINGTON, the name of three cities of some note in the United States.—1. A port of entry in New Jersey, on the Delaware, about 20 m. above Philadelphia, with which, as well as with New York, it is connected by the Camden and Amboy railway. It possesses an Episcopalian college, founded in 1846. Pop. '70, 5817, with about 13,000 tons of shipping.—2. The most populous city in Vermont. It is beautifully situated on the e. shore of lake Champlain. It communicates with the St. Lawrence by means of the Richelieu river and the Chambly canal; while through the Champlain canal it has access to the Hudson. It has railway communication with all parts of the United States and Canada. The Vermont university crowns the slope on which the city stands. Pop. '70, 14,387.—3. A city of Iowa, on the right bank of the Mississippi, 207 m. by rail w.s.w. of Chicago. It occupies a natural amphitheater formed by the limestone bluffs which slope backward from the river. It carries on a large commerce, and there are numerous foundries, breweries, soap-works, pork-packing establishments, flour-mills, and saw-mills. The city is the center of considerable railway communications, and possesses among its educational institutions, business college and Baptist university. Pop. '70, 14,933.

BURLINGTON (*ante*), a city in Des Moines co., Iowa, on the Mississippi; 207 m. w.s.w. of Chicago; pop. '75, 19,987. It is at the junction of several railroads, and is an important business point, having also many manufactories. The business portion is of the river shore, while private residences are on the high bluffs in the rear. It is the seat of Burlington university, and has other excellent schools. There are extensive coal and limestone deposits near by. From 1837 to 1840 it was the state capital.

BURLINGTON (*ante*), a city in Burlington co., N. J., on the Delaware 18 m. above Philadelphia, founded by Quakers in 1677. It is on the Camden and Amboy railroad, and is connected by steamboats with Philadelphia. Among its educational institutions are a college and St. Mary's hall for young women (both Episcopal). There is considerable manufacturing business, and trade by the river and railroads. B. was for a long period the seat of government of the colony of West Jersey, and the last official residence of Wm. Franklin, the governor, at which period and afterwards it had a lucrative West India trade.

BURLINGTON (*ante*), the chief city of Vermont, a port of entry, and the co. seat of Chittenden co., on lake Champlain, 38 m. by rail n.w. of Montpelier; pop. '70, 14,387. The harbor is commodious and safe, protected by a breakwater 900 ft. long; and the location of the city is remarkably fine, both for commerce and charming scenery. Besides the lake navigation, the Central Vermont, Vermont and Canada, Burlington and Lamoyille, and Rutland and Burlington railroads give ample means of communication. There is a steam ferry to Plattsburg, N. Y. The lumber trade is the largest single business, but there are marble works, manufactories, and a large local trade. B. is connected with Winooski, a manufacturing suburb, by a bridge over the Winooski river. The university of Vermont, founded in 1791, is on the highest ground in the city; departments of the university are the agricultural college and a medical school. Another educational feature is the Vermont Episcopal institute, organized in 1858. The city is supplied with gas and water; its notable public buildings and institutes are: a U. S. custom house, a city hall, and a court house; 2 Congregational churches; 2 Roman Catholic; Unitarian, Baptist, Episcopal, and Methodist churches; the Fletcher free library; the Mary Fletcher hospital; Lake View cemetery, near lake Champlain, and Green Mount cemetery, overlooking the Winooski valley, the latter containing a creditable monument over the grave of Ethan Allen.

BURLINGTON. See BRIDLINGTON.

BURLINGTON LIMESTONE, a valuable material for building found in abundance near Burlington, Iowa, and elsewhere along the Mississippi, usually in double beds, the upper one nearly all carbonate of lime, and the lower one containing magnesia. This stone is peculiar for the vast abundance of fossils found in it, especially of crinoidea and corals.

BURMAH, EMPIRE OF, called also the EMPIRE OF AVA, an important kingdom of the Indo-Chinese peninsula, formerly of great extent; but by two contests with the British power in India, it lost several provinces, and is now, in its widest sense and including tributary states, comprehended between 19° 29' and 28° n. lat., and 93° and 100° e. long., having an area of about 188,000 sq. m., and a scanty population estimated at from 3,000,000 to 4,000,000. It is bounded on the n. by mountains, separating it from Assam and Thibet; on the e., by China; on the s., by the British province of Pegu; and on the w., by Munnipore and mountain-ranges dividing it from Tipperah, Chittagong, and

Aracan. The Burman empire, as it now exists, has three well-marked divisions: 1. Northern B., inhabited chiefly by Singphos, Shans, and other tribes; 2. B. proper; 3. The Eastern Shan tributary states. The area of B. proper, from lat. 24° n. to the frontier of Pegu, is 44,450 sq. m., with a population of about 1,200,000.

Physical features.—From the eastern extremity of the great transverse mountain barrier of Northern India, longitudinal ranges strike away southwards, and between two of these the Burman territories are situated. The country slopes from the highland regions of the n. towards the coast, and has been fitly described as "a varied surface of rolling upland, interspersed with alluvial basins and sudden ridges of hill."

The principal river, the Irrawaddy (q.v.), having its source amid the snowy mountains from which descends the Brahmaputra, is the great commercial highway of the country, through the heart of which it takes its course. Passing Amarapura, Ava, and other towns, it enters Pegu, and 90 miles below Prome, divides into an eastern and western branch, the former flowing past Rangoon, the latter forming the Bassein river. The Kyen-dwen is its principal tributary. To the e. of the Irrawaddy, the Salween, after an almost parallel course, enters the British territories in nearly the same latitude.

Climate.—On the coast, only two seasons are known—the dry and the rainy, which are regulated by the n.e. and the s.w. monsoons; but in B. proper, less rain falls, and there are three seasons—the cold, the hot, and the rainy. Some showers fall in May or June, but the great rains last from the middle of Aug. to the end of Oct. The cool season is from the middle of Oct. till the beginning of April, and from this month till the great rains is the hot part of the year, the thermometer ranging from 85° to 100°. The climate is, on the whole, healthy, but the jungles are very pestiferous.

Minerals.—B. has vast fields of mineral wealth, but little enterprise and capital are brought to bear upon them. There are gold mines at Bamo, near the Chinese frontier. Auriferous sand is found in many of the streams. Silver is obtained at Bau-dwen, likewise on the confines of China, and also in the Shan country, from whence comes the chief supply of lead. Iron is quarried at Poukpa, a lofty mountain a few miles e. of Pagan. The celebrated ruby mines of B. are situated 60 or 70 m. n.e. from the capital and are jealously guarded. Sapphires of great size are found in the same stratum, but are more rare. The annual value of the gems is estimated at from £12,000 to £15,000 sterling, and they are the property of the king. Wells of the mineral oil, petroleum, are worked at Ye-nan-young, on the Irrawaddy, above Prome. Marble, noble serpentine, and amber are likewise found in large quantities.

Vegetable productions.—A few only of the most striking of these can be noticed. Of the graceful palm-tribe (*palmeæ*), the cocoa-nut, the betel, the palmyra, and the nipa, or water-palm, are the most prized. The useful bamboo is widely diffused. The teak, of which B. possesses inexhaustible forests, and the hopea, are amongst the most valuable of the timber-trees. Forests of pine grow to the eastward of Amarapura. The wood-oil tree is found on the higher Salween, one trunk of which will produce from 30 to 40 gallons of oil every season. The staple fruit of the country is the plainain or banana. The jack is prized by the natives. The mango reaches the height of 100 ft., and produces a delicious fruit. Rice, wheat, tobacco, indigo, and cotton are cultivated.

Animals.—The *felide*, or cat family, abound, tigers, leopards, and tiger-cats being met with in every part of the country. Of the *pachydermata*, the elephant and rhinoceros are the most noteworthy. The elephant, buffalo, and Indian ox have been domesticated.

Ethnology.—The Burmans belong to that branch of the Mongolidae characterized by a monosyllabic language; they are short-headed, broad-skulled, and flat-faced. The hair is black, and the skin of a deep brown color. Their *dress* is simple, but peculiar. The *in-gie*, a white linen jacket, is common to both sexes. Wrapped around the lower part of the body, the men wear the *put-so*, which is several yards in length; the women, the *te-mine*, a scant garment of cotton or silk. Silks, muslins, and valuable gold ornaments are worn on special occasions. Betel-nut chewing and cigar-smoking are greatly practiced by both men and women. The Burmans are, generally speaking, fine, well-made men, and excel in wrestling, boxing, rowing, foot-ball, and other athletic exercises; they are clever as carpenters and smiths. Burman houses are made of a framework of bamboo, thatched with the leaf of the water-palm, and are invariably raised on posts several feet from the ground. The women are more industrious than the men; they buy, sell, weave, and attend to the domestic concerns. Both sexes delight in merry-making, feasting, buffoonery, and sight-seeing. A *pooy*, or theatrical representation, is a very favorite amusement, and a buffalo-fight attracts crowds of spectators. The Burman has little patriotism, but is attached to his home. Without individual cruelty, he is indifferent to the shedding of blood by his rulers. Though temperate and hardy, he dislikes discipline and continued employment; and when in power, is too often arrogant, arbitrary, and corrupt.

Besides the true Burman, a great variety of races inhabit the Burman territories. The *Telaings*, or *Moans*, descendants of the ancient Peguans, are pretty well amalgamated with the Burmans. The *Shans*, or *Tai*, perhaps the most numerous and widely diffused of the Indo-Chinese peoples, are scattered over the peninsula, from Munnipore to Bangkok. Of the eastern Shan states, some are tributary to B., others to Siam, while those w. of the Irrawaddy are wholly under Burman rule. The *Singphos* cluster round

the mountains of the n., and along the western mountain-boundary of B., wild *Kyghens*, and many tribes under different names, live in varying degrees of civilization. The *Karens* are met with chiefly in southern Burmah.

Religion.—Buddhism (q. v.) is the prevailing religion of B., where it has been preserved in great purity. Its monuments—temples, shrines, and monasteries—are innumerable; its festivals are carefully observed, and its monastic system is fully established in every part of the kingdom. While directing the reader to the special article on **Buddhism** for an account of its doctrines, history, etc., we may here glance at its development, institutions, and edifices among the Burmans.

The members of the monastic fraternity are known in B. as *pon-gyees*, meaning "great glory;" but the Pali word is *rahan*, or holy man. The *pon-gyees* are not priests, in the usual acceptation of the term, but rather monks. Their religious ministrations are confined to sermons, and they do not interfere with the worship of the people. They are a very numerous class, living in monasteries, or *kyoungs*, and may at once be known by their yellow robes (the color of mourning), shaven heads, and bare feet. They subsist wholly by the charity of the people, which, however, they well repay by instructing the boys of the country. The *kyoungs* are thus converted into national schools. The vows of a *pon-gyee* include celibacy, poverty, and the renunciation of the world; but from these he may at any time be released, and return to a secular life. Hence, nearly every youth assumes the yellow robe for a time, as a meritorious act, or for the purpose of study, and the ceremony of making a *pon-gyee* is one of great importance. The ostensible object of the brotherhood is the more perfect observance of the laws of Buddha. The order is composed of five classes—viz., young men who wear the yellow robe and live in the *kyoungs*, but are not professed members; those on whom the title and character of *pon-gyees* have been solemnly conferred with the usual ceremonies; the heads or governors of the several communities; provincials, whose jurisdiction extends over their respective provinces; and, lastly, a superior general, or great-master, who directs the affairs of the order throughout the empire.

No provision is made for religion by the government, but it meets with liberal support from the people. A *pon-gyee* is held in profound veneration; his person is sacred, and he is addressed by the lordly title of *pra* or *phra*; nor does this reverence terminate with his death. On the decease of a distinguished member, his body is embalmed, while the limbs are swathed in linen, varnished, and even gilded. The mummy is then placed on a highly decorated cenotaph, and preserved, sometimes for months, until the grand day of funeral. The Burman rites of cremation are very remarkable, but we cannot here enlarge upon them. On the whole, a favorable opinion may be passed on the monastic fraternity of B.; although abuses have crept in, discipline is more lax than formerly, and many doubtless assume the yellow robe from unworthy motives.

In B., the last Buddha is worshiped under the name of Gautama. His images crowd the temples, and many are of a gigantic size. The days of worship are at the new and full moon, and seven days after each; but the whole time, from the full moon of July, to the full moon of Oct., is devoted to the Burmans to a stricter observance of the ceremonies of their religion. During the latter month, several religious festivals take place, which are so many social gatherings and occasions for grand displays of dress, dancing, music, and feasting. At such times, barges full of gayly-dressed people, the women dancing to the monotonous dissonance of a Burman band, may be seen gliding along the rivers to some shrine of peculiar sanctity. The worship on these occasions has been described by an eye-witness, in 1857, as follows: "Arrived at the shrines and temples, the people suddenly turn from pleasure to devotion. Men bearing ornamental paper-umbrellas, fruits, flowers, and other offerings, crowd the image-houses, present their gifts to the favorite idol, make their *shek-ho*, and say their prayers with all dispatch. Others are gluing more gold-leaf on the face of the image, or saluting him with crackers, the explosion of which in nowise interferes with the serenity of the worshippers. The women for the most part remain outside, kneeling on the sward, just at the entrance of the temple, where a view can be obtained of the image within." On another occasion, we read: "The principal temple being under repair, was much crowded by bamboo scaffolding, and new pillars were being put up, each bearing an inscription with the name of the donor. . . . The umbrellas brought as offerings were so numerous, that one could with difficulty thread a passage through them. Some were pure white, others white and gold, while many boasted all the colors of the rainbow. They were made of paper, beautifully cut into various patterns. There were numerous altars and images, and numberless little Gautamas; but a deep niche or cave, at the far end of which was a fat idol, with a yellow cloth wrapped round him, seemed a place of peculiar sanctity. This recess would have been quite dark, had it not been for the numberless tapers of yellow wax that were burning before the image. The closeness of the place, the smoke from the candles, and the fumes from the quantity of crackers constantly being let off, rendered respiration almost impossible. An old *pon-gyee*, however, the only one I ever saw in a temple, seemed quite in his element; his shaven bristly head and coarse features looking ugly enough to serve for some favorite idol, and he seemed a fitting embodiment of so senseless and degrading a worship. Offerings of flowers, paper-ornaments, flags, and candles were scattered about in profusion. The beating a bell with a deer's horn, the explosion of crackers, and the rapid mutter-

ing of prayers, made up a din of sounds, the suitable accompaniment of so misdirected a devotion."

The rosary is in general use, and the Pali words *aneitya! doka! anatta!* expressing the transitory nature of all sublunary things, are very often repeated. The Burman is singularly free from fanaticism in the exercise of his religion, and his most sacred temples may be freely entered by the stranger without offense; indeed, the impartial observer will hardly fail to admit that Buddhism, in the absence of a purer creed, possesses considerable influence for good in the country under consideration. "It teaches man to combat, control, and master the passions of his heart, to make reason predominate over sense, mind over matter, and to practice the virtues required for the attainment of these objects."

The sacred edifices are of three kinds: 1. The tope, dagoba, or *shrine* (*zudee* or *tsa-dee*), a monument erected to the last Buddha, is a solid, bell-shaped mass of plastered brickwork, tapering to the summit, which is crowned by the *tee*, or umbrella, of open ironwork. 2. The *temple*, in which are many images of Gautama. The most remarkable specimen of Burman temple-architecture is the *ananda* of Pagan. The ground-plan takes the form of a perfect Greek cross; and a tapering spire, with a gilded tee at the height of 168 ft. from the foundation, crowns the whole. 3. The *kyoung* or monastery (*vihara*) is generally constructed with a roof of several diminishing stages, and is often elaborately adorned. Burman architecture "differs essentially from that of India in the frequent use of the pointed arch, not only for doors and windows, but also in the vaulted coverings of passages."

Cities.—Mandalay, the present capital of B., and seat of royalty, is situated 3 m. from the Irrawaddy, a little to the n. of Amarapura and Ava. It is laid out in three parallelograms, one within another, of which the inner two are walled; the palace occupies the center. Ava and Amarapura, each at one time the capital of the empire, are now almost entirely deserted. Pagan represents the past of B., and is remarkable for its magnificent ruins of temple-architecture, extending over 8 sq.m.; the prevailing type is the cruciform vaulted temple.

Government.—The government of B. is a pure despotism, life and property being at the mercy of the reigning sovereign. Many instances of the cruel abuse of arbitrary power, by even recent kings, might be given. The present monarch is, however, mild, approachable, and apparently desires the welfare and happiness of his subjects. The *lot-dau*, or high court of council, is composed of the four *woon-gyees*, or principal ministers of state. The *atreen-woons*, or household ministers, are likewise four in number. They receive the royal commands, and are in close attendance upon the king. The *woon-douks* are a third order of ministers, and act as assistants to the *woon-gyees*. The decisions of the *lot-dau*, when sanctioned by the king, become law. The *Dam-a-that*, a Burman translation of the *Institutes of Menu*, is also in force. White umbrellas and white elephants are regarded as insignia of royalty. The "lord white elephant," indeed, is looked on as an estate of the realm, a mark of universal sovereignty, and a sacred being. It has a palace, a minister, and numerous attendants.—The *military power* of the country is not great, and of musketeers it is probable that the king could not command more than 18,000.

The *civilization* of B., if not retrograde—which the ruins of Pagan would almost seem to indicate—is stationary and stereotyped, like that of China. All the wealth of the country is lavished on the sacred edifices, £10,000 sterling being sometimes expended on the gilding and beautifying of a single shrine or temple, whilst roads, bridges, and works of public utility are neglected.

The *vernacular tongue* of B. belongs to the monosyllabic class of languages, and is without inflection; the character is formed of circles and segments of circles. It is engraved on prepared strips of palm-leaf, and a number of these form a book. Printing is unknown, except where introduced by the missionaries. *Pali* is the language of the religious literature.

Commerce.—Since B. was deprived of its harbors and maritime districts, its foreign commerce has been very limited. The principal exports (from B. proper) consist of Sesamum oil, teak-timber, petroleum, sweet-oil, tobacco, lackered boxes, gold leaf, silver, lead, copper, stick-lac, indigo, cocoa-nuts, ponies, wheat, pulse, and cotton. The imports (into the Burman empire) are *ngapee* (a paste of rank pickled fish, which is eaten with rice, the staple food of the Burman), paddy, rice, dried fish, salt—all these being imported by thousands of tons annually—cotton piece-goods, silk do., and woollens: B. carries on an overland traffic with China, exporting cotton and importing silk. A commercial treaty with Britain was concluded in 1867, but has remained almost a dead letter.

The standard *currency* of B., called *yowet-ni* (red-leaf), is silver, but there is no coinage. This metal is used, however, of varying degrees of purity, which complicates mercantile transactions, and assayers are employed to find the value of the metal.

History.—Of the early and mythical history of B., nothing need here be said. The kingdoms of Ava and Pegu long contended for mastery. The latter was in its zenith in about 1580 A.D. Passing on to 1752, it appears that the Peguans, after a period of subjection, obtained the advantage. At this time, however, Alompra, or *Aloung Pra*, the most celebrated warrior-king in Burman history, rose to power, founded the present

dynasty, subdued the Peguans, and incorporated their country, as well as many neighboring states, with his own. The Burman empire attained its greatest expansion in 1822. The wars of 1822-24 and 1852, with the British, reduced B. to its present limits. The savage excesses of the king of B. led in 1879 to the withdrawal of the British ambassador and his staff. See Yule's *Narrative of the Mission in 1855*; Fyche's *Burma Past and Present* (1878); Winter's *Six Months in B.* (1858); Capt. Bower's *Bhamo Expedition* (1869); Vincenti's *Land of the White Elephant* (1874); Gordon's *Burmah and its Inhabitants* (1876); Anderson's *Mandalay to Momien* (1876); M'Mahon's *The Karens and the Golden Chersonese* (1876).

BURMAH, BRITISH, includes the three maritime provinces of India beyond the Ganges, which were united under one local administration in 1862. It extends along the eastern side of the bay of Bengal, from 20° 50' to 10° 50' n. lat. It has a coast-line of fully 900 English m., and a total area of 88,556 sq. m., distributed as follows: Aracan, 14,526, Pegu, 27,300; Tenasserim, 46,730.

The whole of this territory was taken from the king of Burmah in the two wars provoked by him.

Akyab, Rangoon, and Maulmain are the principal seaports of Aracan, Pegu, and Tenasserim respectively. Pegu is the most prosperous of these three divisions, and has made the most progress within recent times. Pop. of B. '72, 2,747,148. The Burmans (including Aracanese and Talcins, or Peguens) number about two millions. Of the other races—Karens, Shans, Chinese, and Hindus—the Karens are the most numerous and interesting.—Report by lieut. col. sir A. P. Phayre, etc.

BURMANN, PETER, the most important member of a Dutch family celebrated for learning, was b. at Utrecht 1668, studied law at the university of that city and of Leyden, and, after taking his degree in 1688, traveled through Germany and Switzerland. After practicing as an advocate for some years, he was appointed professor of history and rhetoric in the university of Utrecht; which office he subsequently exchanged for the professorship of Greek. In 1715, after the death of Perizonius, he removed to the university of Leyden, where he died 31 Mar., 1741.

His literary career was very active, and his hot temper and intolerant spirit involved him in many controversies. Among his most distinguished adversaries were Le Clerc and Bentley. His chief works are editions of the Latin classics—Petronious, Velleius Paterculus, Quintilian, Valerius Flaccus, Phædrus, Ovid, the Poætæ Minores, Suetonius, Lucan. The first of these appeared in 1709, and the last in 1740. They are characterized less by taste and critical acumen than by learning, fullness of matter, and beauty of type.

BURMEISTER, HERMANN, b. 1807; a German naturalist; studied medicine and natural history, and in 1842 was appointed professor of zoology in the university of Halle. In 1848, he was a deputy to the Frankfort assembly, and afterwards a representative in the first Prussian chamber. In 1850, he made a survey in Brazil in the interest of science, and visited other parts of South America a few years later. He has published many elaborate works on natural history, travels, etc.

BURMESE WARE, small cups, etc., made of strips of bamboo woven like fine basket work, the interstices being filled with paste made of wood-oil and fine powders, and when sufficiently hardened the surface smoothed with pumice-stone and water. Sometimes they are ornamented with pictures worked in with the varnish.

BURN, RICHARD, was b. in 1720 at the village of Winton, in Westmoreland. After being educated at Queen's college, Oxford, he received the living of Orton, in his native county, which he continued to hold until his death in 1785. He is widely known as the compiler of two very useful law-books, the *Justice of the Peace* and *Ecclesiastical Law*, which have each passed through many editions. He also published a *History of the Poor Laws*, an edition of Blackstone's *Commentaries*, and several sermons and works of a religious nature.

BURNAP, GEORGE WASHINGTON, D.D., 1802-1859; a graduate of Harvard and pastor of the First Independent church of Baltimore from 1828 until his death. He was the author of many volumes on religious themes, lectures, a life of Calvert, governor of Maryland, etc.

BURNES, Sir ALEXANDER, a distinguished traveler in Central Asia, was b. at Montrose, in Scotland, 1805, where his father, who was a cousin of Robert Burns the poet, was an active magistrate. He early entered the Indian army, and his knowledge of oriental languages gained him rapid promotion. After performing some important missions for the Indian government, he was, at his own suggestion, sent on an expedition into Central Asia. Starting from Lahore on the 11th Feb., 1832, B., having adopted the dress and usage of the Afghans for greater safety, passed through Peshawur and Cabul, and, crossing the Indian Caucasus, reached Balkh on the 9th June. Thence he passed on to Bokhara, Astrabad, and Teheran, and journeying through Ispahan and Shiraz, reached Bushire on the Persian gulf, from whence he embarked for India. He received the special thanks of the governor-general for his travels; and on his return to England in 1833, he received a warm welcome from the India house and board of control, and was highly honored by the royal geographical and other societies. In Sept.,

1839, having previously, for his important services, been knighted and promoted to the rank of lieutenant-col., he was appointed political resident at Cabul, where he was murdered on the breaking out of the insurrection in that city in Nov., 1841—a tragedy re-enacted in 1879, when sir Louis Cavagnari, newly appointed resident in Cabul, was massacred, with his staff and guards. B. was author of *Travels into Bokhara* and a work on *Cabul*.

BURNET, the English name of two genera of plants, *sanguisorba* and *poterium*, belonging to the natural order *sanguisorbeæ* (q.v.)—very generally regarded as a suborder of *rosaceæ*—which have much resemblance to one another, and receive a common name also in other languages. *Sanguisorba* has hermaphrodite flowers with four stamens; in *poterium*, the flowers are polygamous, and the stamens indefinite in number. In both, the calyx is 4-fid, and the corolla wanting. GREAT B. (*sanguisorba officinalis*) is common in meadows in all parts of Europe, and not unfrequent in some parts of England, particularly where the soil is calcareous. It has a stem 1 to 2 ft. high, pinnate leaves, with about four pair of ovate serrated leaflets and an odd one; the flowers are crowded in dark red spikes. It is cultivated in Germany for feeding cattle, and is much esteemed for this use, as it grows well even on very poor soils, and the produce is abundant. Cattle are very fond of it. The root is astringent, and was formerly used in medicine. COMMON B. (*poterium sanguisorba*) grows in sunny places on hills in the middle and south of Europe, and is common in England, especially in the chalk districts. In habit and foliage, it much resembles the Great B., but the leaflets are smaller and the flowers are in heads of a dull purplish color. It has been much cultivated in some parts of England as a substitute for clover on chalky soils, and is relished by cattle. It forms great part of the natural pasture of the South Downs, and of the excellent sheep-walks of Salisbury plain. It is regarded as a plant particularly suitable for poor arid soils. It is sometimes cultivated in gardens, and its leaves, which are slightly astringent, are used in salads or soups. They are said to form one of the ingredients of the famous *cool tankard*, and the name *poterium* is from Greek word signifying a drinking vessel.—Both this and the preceding are perennial plants.—There are several other species both of *sanguisorba* and *poterium*, some of the latter shrubby, natives chiefly of the warmer temperate parts of the world.

BURNET, a co. in central Texas, on the Colorado river; 995 sq. m.; pop. '70, 3688—358 colored; in '80, 7033. The surface is hilly and rocky, with fertile soil. Marble of various colors, limestone, coal, iron, and petroleum are found. Agriculture is the main business. Co. seat, Burnet.

BURNET, GILBERT, bishop of Salisbury, was b. at Edinburgh, on the 18th Sept., 1643. He was educated at home, and afterwards at Marischal college, Aberdeen, where he pursued his studies so diligently, that he took his degree of M.A. before he was 14. In the course of a year he made up his mind to enter the church, and read so hard at theology, that in less than three years he had mastered the chief systems of divinity, besides having gone over the Old and New Testaments in the original, with all the commentaries of note in his time. In 1663, he visited Cambridge, Oxford, and London, where he met with many of the leading divines of England. Next year, he passed over into Holland and perfected his knowledge of Hebrew under a learned rabbin of Amsterdam. In 1665, he was presented to the parish of Saltoun, where he remained five years. In 1669, he was appointed professor of divinity in the university of Glasgow, but having mixed himself up in the politico-ecclesiastical affairs of the time, he brought upon himself the enmity of Lauderdale, and found it prudent to resign his chair in 1674. He now removed to London, and was made preacher at the Rolls' chapel by sir Harbottle Grimston, and afterwards lecturer at St. Clement's. In 1676, he published his *Memoirs of the Dukes of Hamilton*, and in 1679, the first volume of his *History of the Reformation*, which procured him a vote of thanks from both houses of parliament. Next year appeared *Some Passages in the Life and Death of the Earl of Rochester*, in which B. records the religious interviews which he had with that profligate nobleman during his last illness, and which led to the latter's conviction of the truth of Christianity. In 1681, he published the second volume of his *History of the Reformation*, and in 1682 his *Life of Sir Matthew Hale*. The efforts which had previously been made, were now repeated, to induce him to break with the liberal and moderate party, and to attach himself to the king. He was offered the bishopric of Chichester, but refused it. In 1683 he narrowly escaped being brought into trouble in regard to the Ryehouse plot. He conducted the defense, attended the execution, and vindicated the memory of his friend lord William Russell. The king exhibited his unkingly spite by depriving B. of his St. Clement's lectureship. On the accession of James II., he went to the continent, and traveled through France, Italy, Switzerland, and Germany. In 1684, he was introduced to the prince of Orange, with whom he became a great favorite, and by whom he was frequently consulted in reference to the great scheme for the deliverance of England. When William came over, B. accompanied him in the capacity of royal chaplain, and shortly after, was appointed bishop of Salisbury. He entered on the duties of his diocese with great ardor; but his first pastoral letter, in which he founded the right of William to the throne on conquest, gave so much offense to both houses of parliament, that they ordered it to be burned by the hands of the common hangman. William, however, who

knew the excellent qualities of the bishop, was not greatly impressed by this solemn performance, and continued to trust B. to the end of his life. In 1698, B. was appointed preceptor to the duke of Gloucester; in 1699, he published his celebrated exposition of the 39 articles, which was condemned as heterodox by that not very competent assembly, the house of lords. In 1714, appeared the third volume of his *History of the Reformation*. In the spring of 1715, he was attacked by a pleuritic fever, and carried off on the 17th of Mar., in the 72d year of his age. B. was thrice married: his first wife was remarkable for her beauty; the second, for her fortune; and the third, for her piety.

Soon after B.'s death, appeared *Bishop B.'s History of his Own Time, from the Restoration of King Charles II. to the Conclusion of the Treaty of Peace at Utrecht, in the Reign of Queen Anne*. It was sarcastically but foolishly abused by the tory writers of the day—Swift, Pope, Arbuthnot, and others. B. was a man of strict, almost of puritanic virtue; yet his charity, geniality, and moderation of sentiment might be imitated with advantage even in our own day. His style is neither elegant nor correct, and his judgment is not always reliable, yet the honesty, earnestness, simplicity, and vigor of his writings, as well as their fullness of details, make his works very valuable to the student of history.

BURNET, JACOB, LL.D., 1770–1853; a graduate of Princeton, and one of the early settlers of Cincinnati; judge of the Ohio supreme court in 1821, and U. S. senator in 1828. He published *Notes on the Early Settlement of the North-west Territory*.

BURNET, JOHN, a painter, engraver, and author, was b. at Fisherrow, near Edinburgh, Mar., 1784. He was first brought under the notice of the public through his engravings of Wilkie's works, which he executed in a most admirable manner. Of his own paintings, the best known engraving is that of "Greenwich Pensioners receiving News of the Battle of Trafalgar." He has written several works on art, illustrated by drawings and engravings of his own, the most important of which is a *Practical Treatise on Painting*. He is also the author of *Rembrandt and his Works*, 4to, 1849; and in conjunction with Mr. Peter Cunningham, of *Life and Works of J. M. W. Turner*, 1852. He died in 1868.

BURNET, THOMAS, best known from his *Theory of the Earth*, was b. in Yorkshire, 1635, and studied at Cambridge. After acting as traveling tutor to several noblemen, he was elected master of the charter-house (1685), and later, succeeded archbishop Tillotson as clerk of the closet to William III. But having (1692) published a work, *Archæologia Philosophicæ, sive Doctrina Antiqua de Rerum Originibus* (also in English), displaying great learning, but treating the Mosaic account of the fall as an allegory, he was obliged to retire from the clerkship, and lived in the charter-house till his death, in 1715. His *Telluris Theoria Sacra* (first part, 1680; second, 1689) was written in Latin, but translated, or rather recomposed in English, by the author. It is an ingenious speculation, written in ignorance of the facts of the earth's structure, and is therefore a mere system of *cosmogony*, and not geology. But it abounds in sublime and poetical conceptions and descriptions, conveyed in language of extraordinary eloquence, and called forth the highest applause at the time.

BURNETT, A. CO. in n.w. Wisconsin, on the St. Croix river, 1100 sq. m.; pop. '70, 1456. Co. seat, Gordon.

BURNETT, WALDO IRVING, 1828–54; a naturalist and microscopist; b. Mass. He did a great amount of microscopical work within the five years preceding his death. His chief publication was a prize essay on *The Cell, its Physiology, Pathology, and Philosophy, deduced from Original Observations; to which is added its History and Criticism*.

BURNETT PRIZES, THE, are two theological premiums, founded by Mr. Burnett of Dens, Aberdeenshire. This gentleman (b. 1729—d. 1784) was a general merchant in Aberdeen, and for many years during his lifetime spent £300 annually on the poor. On his death, he bequeathed the fortune he had made to found the above prizes, as well as for the establishment of funds to relieve poor persons and pauper lunatics, and to support a jail chaplain, in Aberdeen. He directed the prize fund to be accumulated for 40 years at a time, and the prizes (not less than £1200 and £400) to be awarded to the authors of the two best treatises on "The evidence that there is a Being all-powerful, wise, and good, by whom everything exists; and particularly to obviate difficulties regarding the wisdom and goodness of the Deity; and this independent of written revelation, and of the revelation of the Lord Jesus; and from the whole to point out the inferences most necessary and useful to mankind." The competition is open to the whole world, and the prizes are adjudicated by three persons appointed by the trustees of the testator, together with the ministers of the established church of Aberdeen, and the principals and professors of King's and Marischal colleges, Aberdeen. On the first competition in 1815, 50 essays were given in; and the judges awarded the first prize, £1200, to Dr. William Lawrence Brown, principal of Marischal college and university of Aberdeen, for an essay entitled *The Existence of a Supreme Creator*; and the second prize, £400, to the Rev. John Bird Sumner, afterwards archbishop of Canterbury, for an essay entitled *Records of Creation*. On the second competition, in 1855, 208 essays were given in; and the judges, Rev. Baden Powell, Mr. Henry Rogers, and Mr. Isaac Taylor, awarded the first prize, £1800, to the Rev. R. A. Thompson, Lincolnshire, for an essay entitled *Christian Theism*; and the second prize, £600, to the Rev. Dr. John Tulloch, principal of St. Mary's college, St. Andrews, for an

essay on *Theism*. The above four essays have been published in accordance with Mr. Burnett's deed. It is expected that £10,000 will be available in 1895.

BURNETT'S DISINFECTING LIQUID AND ANTISEPTIC FLUID is a liquid introduced by sir W. Burnett for the purpose of deodorizing the bilge-water of ships, sewerage-water, etc. It is a strong solution (sp. gr. 2) of chloride of zinc, accompanied by a small amount of chloride of iron; and when intended to be used, it is mixed with water in the proportion of one pint to five gallons of water. The liquid acts only as a *deodorizer* and *antiseptic* (see **ANTISEPTICS**), and does not yield any vapor which can exhibit the properties of a disinfectant (q. v.). It is of service in preserving dead animal tissues, as in the dissecting-room, and in jars containing anatomical specimens. It has little action on knives or steel instruments. When added to bilge or sewerage water, the chloride of zinc (ZnCl) mainly acts by decomposing the offensive sulphide of ammonium (NH₄S), which it does by forming the sulphide of zinc (ZnS) and chloride of ammonium (NH₄Cl), both of which are odorless. The strong solution of chloride of zinc has also been applied to the preservation of timber, and the process of so treating wood is called, after its inventor, *Burnettizing*. *Creech's* disinfectant liquid is chemically the same as the above.

BURNEY, Dr. CHARLES, a musical composer, celebrated as the author of the *General History of Music*, was b. at Shrewsbury, 1726. Having studied music in his native city, in Chester, and under Dr. Arne in London, he commenced giving lessons in music himself. After composing three pieces—*Robin Hood*, *Alfred*, and *Queen Mab*—for Drury Lane, B. London, and settled at Lynn, in Norfolk, where he designed his work on the *History of Music*. In 1770-72, he traveled in France, Italy, the Netherlands, and Germany, collecting materials for his proposed work, and published an essay on the *Present State of Music in France and Italy*, etc. (2 vols., Lond. 1772). This was followed by his *General History of Music from the Earliest Ages to the Present Period* (4 vols., Lond. 1776-89.) Besides other minor works, B. wrote a *Life of Handel*, and nearly all the musical articles in *Rees's Cyclopaedia*. He was appointed organist to the hospital at Chelsea in 1789. He died in 1815. He was intimately acquainted with many of the most eminent men of the day, including Edmund Burke and Dr. Johnston.—His second daughter, FRANCISCA B. (afterwards Madame D'Arblay), became distinguished as authoress of *Evelina*, *Cecilia*, *Georgina*, and *Camilla*—novels formerly very popular, and still retaining some interest.

BURNEY, FRANCES (Madame D'Arblay). See **BURNEY, Dr. CHARLES**, *ante*.

BURNING GLASSES AND MIRRORS. See **HEAT, LENS, and MIRROR**.

BURNLEY, a thriving t. and parliamentary borough in Lancashire, situated in a narrow vale on the banks of the Brun, a mile and a half above its junction with the North Calder, and 24 m. n. of Manchester. Pop. '71, of p. b., 44,320. It has manufactures of cottons and woollens, calico-printing works, iron and brass foundries, machine-making works, breweries, tanneries, and rope-works. There are collieries in the vicinity, and traffic is facilitated by railways and canals, which unite it with the principal centers of trade in Lancashire and Yorkshire. B. returns one member to parliament.

A Roman vicinal way passed through the town, part of which is still known and used as the "Long Causeway." Roman coins, pottery, urns, etc., have been found near the town, and an extensive series of beacons, encampments, dikes, etc., occupy the slopes of the hills in the neighborhood for a linear distance of more than 10 miles. From the name of the river, *Brun*, and other circumstances, these slopes are supposed to furnish a very probable site for the battle of Brunnanburh, so celebrated in Saxon history.

BURNOUF, EUGENE, one of the most distinguished orientalists of modern times, was b. at Paris, April 1, 1801, and after entering on the study of law, betook himself to the oriental languages, especially those of India and Persia. In conjunction with prof. Lassen of Bonn, he published, in 1826, *Essai sur le Pali*, which was followed, in 1827, by *Observations Grammaticales sur quelques Passages de l'Essai sur le Pali*. His great aim, however, at this time, was to obtain a complete knowledge of the remains of the religious literature in the Zend, or old Persian language, which had been neglected since the time of Anquetil du Perron, or, at least, not philologically and critically examined. B. undertook to decipher those curious MSS. which Anquetil du Perron had brought home with him, and which lay unregarded in the *Bibliothèque Impériale*. He commenced by causing the *chef-d'œuvre* of old Persian literature, the *Vendidad-Sadé* (one of the books of Zoroaster), to be lithographed with great care, and published from time to time in the *Journal Asiatique* the brilliant results of his laborious studies, which drew upon him the regard of the learned world. In 1834, he published the first volume of his *Commentaires sur le Yaçna l'un des Livres Liturgiques des Perses*, a work which, for the first time, rendered possible a knowledge not only of the dogmas, but also of the language of Zoroaster. It is a masterpiece of conscientious industry, united with copious lingual and antiquarian lore. His studies in the Zend language induced him to make an attempt to decipher the cuneiform inscriptions of Persepolis, in his *Mémoire sur deux Inscriptions Cunéiformes* (Par. 1836). In 1840, he published the text along with a translation of the *Bhāgavat-Purāna*, a system of Indian

mythology and tradition. As the fruit of his study of the Sanscrit books of the Buddhists, appeared in 1845 the *Introduction à l'Histoire du Bouddhisme*. See BUDDHISM. This great work absorbed for six years the whole energies of B., who was now the recognized successor of Silvestre de Sacy. It is to be regretted that death did not permit him to continue his labors further. He died May 28, 1852.

BURNS, FRANCIS, D.D., 1809-63; b. in New York; a colored preacher who became a bishop of the Methodist Episcopal church. In 1834, he was a missionary in Liberia, where, in 1851, he founded the Monrovia academy.

BURNS, Rev. JABEZ, D.D., a Baptist minister, and one of the most prolific religious writers of the 19th c., was b. at Oldham, near Manchester, in 1805, and was educated at Chester, and afterwards at Oldham grammar-school. After helping his father as a medical practitioner, and acting as assistant in a drapery establishment, he joined the Methodist New Connection, and removed at the age of 21 to London. In 1828 and 1829, he published his first two works, *The Christian Sketch-book* and *The Spiritual Cabinet*, which gained him much popularity among the religious public. After having exercised the functions of the ministry at Perth, in Scotland, for a few years, he returned to London in 1835, to become minister of the General Baptist congregation assembling in New Church street chapel, Marylebone. Here his fame increased so much, that it was found necessary twice to enlarge his chapel during the first 25 years of his ministry, in order to afford room for the large numbers who flocked to hear him. He was elected by the body to which he belonged to fill various posts of honor, and lectured in all parts of the United Kingdom on temperance, peace, abolition of capital punishment, etc. In 1839, Dr. B. became editor of the *Temperance Journal*. About 1846, he received the degree of D.D. from the Wesleyan university of Middleton, Conn. Meantime his pen had not been idle, the number of his separate works, being upwards of 30, some of them consisting of a number of volumes, and one of them, *Sketches and Skeletons of Sermons*, of 15 vols., having reached the 14th edition. The following are the names of a few: *Christian Exercises for every Lord's Day* (1858); *Christian Philosophy* (1849); *Death-bed Triumphs of Eminent Christians*; *Light for the House of Mourning* (1850); *Pulpit Cyclopædia*, 4 vols. (1846-60); *Marriage Gift-book and Bridal Token* (1862); etc., which are all highly popular among a large section of the English and American evangelical religious world. Dr. B. died in 1876.

BURNS, ROBERT, the great lyric poet of Scotland, was b. 25th Jan., 1759, in a small cottage near Ayr. His father, then a nursery-gardener, and afterwards the occupant of a small farm, had to struggle all his life with poverty and misfortune, but made every exertion to give his children a good education; and the young poet enjoyed an amount of instruction and miscellaneous reading which, to those unacquainted with the habits of the Scottish peasantry, would seem incompatible with the straitened circumstances and early toil which were his lot. About his 16th year, he began composing verses in the Scottish dialect, which attracted notice in the vicinity, and extended the circle of his acquaintance; and thus he became exposed to temptations which, acting on an extremely sociable and passionate disposition, broke in upon the previous sobriety and correctness of his life. A small farm, on which he had entered with his brother in 1781, proved far from a prosperous undertaking; and being harassed and embittered by other misfortunes—the results of imprudence—he resolved to leave his native land, and go to Jamaica. Partly to procure the means of paying his passage, he published a collection of his poems at Kilmarnock in 1786. The reception these met with was highly favorable, and his genius was recognized in quarters where he had not looked for notice. While preparing to embark, he received a letter encouraging him to go to Edinburgh, and issue a new edition. This was the turning-point of his life. During his stay in the Scottish metropolis, he associated with all that was eminent in letters, rank, and fashion, and his conversational powers excited little less admiration than his poetry. The profits of the publication were considerable, and enabled him to take the farm of Ellisland, near Dumfries, where he settled in 1788, having publicly ratified his marriage with Jean Armour. With his farm he conjoined the office of an exciseman; but after 3 or 4 years, he was obliged to give up farming, and from that time lived in Dumfries, dependent on his salary from the excise, which, at first, only £50, never rose above £70. The striking contrasts in the lot of the rich and the poor with which his residence in Edinburgh had impressed him, made him hail the French revolution with enthusiasm; and some imprudent expressions of his having been reported to the authorities, destroyed his prospects of promotion in the service, and only the interference of an influential friend prevented him from losing his office. Such was then the terror of innovation, and the hatred of everything like liberal opinions, that many of the better classes, who had feted the poet, now shunned the "Jacobin," as they stigmatized him. Imbittered by what he felt to be injustice, he recklessly allowed those habits of dissipation to grow upon him which made the more respectable of all classes look coldly on him; and the remorse thus occasioned in his calmer moments aggravated that tendency to melancholy which the gloom and toil of his early years had probably implanted in his constitution. Broken in health, he died 21st July, 1796.

The poetry of B. is purely the outpouring of the moment—the response of the feelings to the immediate circumstances of life. Its charm and power lie in the justness

of the feelings expressed, and in the truthfulness and freshness which it derives direct from life. Seldom have such manliness, tenderness, and passion been united as in the songs of Burns. They formed the first awakening of the spirit of true poetry in Britain after a long slumber. The popularity that B. instantly acquired has continued unabated, not only in his native Scotland, but wherever English is spoken; his poems have also been translated into almost every European tongue. Dr. Currie, of Liverpool, published the first collected edition of his poems and letters, with a life (4 vols., Lond., 1800). Several more complete collections have appeared since, such as that by Allan Cunningham (8 vols., Lond. 1834), and that by Mr. Scott Douglas, of which the first volumes appeared in 1877. A life of B., by Lockhart, appeared, Edin. 1828. In *The Life and Works of Burns* (Edin. 1851-52), by R. Chambers, the poems are incorporated in the narrative in chronological order.

In 1859, the centenary of B.'s birth was celebrated with unparalleled enthusiasm, not only in every city and almost in every village of Scotland, but in the chief cities of England, and throughout America, the British colonies, and India.

BURNSIDE, AMBROSE EVERETT, b. Ind., 1824; a graduate of West Point, serving in the army until 1853, when he resigned and established in Rhode Island a factory for making a breech-loading rifle of his own invention. In the civil war he served as colonel, and brig. and maj.gen. of volunteers, and was in many important engagements. He resigned at the close of the war, and in 1866 was chosen governor of Rhode Island; was re-elected twice afterwards; in 1875 became U. S. senator.

BURNS and **SCALDS** are injuries to the surface of the living body arising from excessive heat—a scald implying that the heat proceeded from a fluid medium, as boiling water; a burn, from a solid. The injury is much the same in both cases; therefore the directions for the treatment of burns will be applicable also to scalds. These injuries may be divided into three classes: 1. Burns resulting in simple redness of the skin; 2. Burns resulting in vesication or blistering; 3. Burns resulting in sloughing, or death of the part. The first object, after the accident has occurred, is to relieve the suffering; and cold applied either in the form of ice or water seems in most cases to have almost a specific power in allaying pain and checking the advance of inflammation. In other cases, moderate warmth is found more efficacious, and we must be guided mainly by the sensations of the sufferer as to which of these remedies we make use of. In very severe cases, opium or chloroform may be employed. But if the injury the body has received be very serious, the patient complains less of pain than of cold; he shivers, is much depressed, and must be well supplied with stimulants, to prevent his dying from the shock.

The best local application is the Carron-oil, which derives its name from the famous ironworks, where it has been used for many years. It consists of equal parts of olive-oil and lime-water, and should be applied on linen rags or cotton-wool. Blisters may be pricked, and the contained serum allowed to trickle away, but on no account is the raised skin to be removed. The dressings should not be changed oftener than cleanliness requires; and as each portion of the old dressing is removed, it must at once be replaced with fresh, so that as little exposure as possible of the burnt surface may take place. The main principle of treatment is exclusion of the air from the injured part; and so long as this is effected, it matters but little what remedial agent is employed. Great care must be taken in the treatment of a sore resulting from a burn, that the contraction of the scar does not cause distortion of the neighboring parts.

When the clothes catch fire, the person should lie down on the floor, and roll herself, or be rolled, in the rug, table-cover, or anything sufficiently voluminous to stifle the flames; and afterwards the clothes, especially stockings, should be removed with great care, lest the cuticle should separate with them, which would materially increase the sufferings of the patient.

Extensive scalds or burns are very fatal to young children; and it must be remembered that their skin is more susceptible to external impressions, and will suffer from a degree of heat innocuous to an adult. Infants have frequently been scalded to death in too hot baths, or by too hot fomentations. The principles of treatment for burns produced by the contact of chemical agents to the skin, are the same as those for burns by fire.

BURNTISLAND, a seaport t. of Fifeshire, on the n. shore of the firth of Forth, about 8 m. n.w. of Edinburgh. It consists of one long street, clean and well kept, with a back street running parallel, and some diverging lanes. B. is an important station of the North British railway, having a steamboat ferry connecting it with Granton, the station on the opposite side of the Forth. It has a commodious harbor, which was greatly improved in 1876, and dock. Its trade consists principally of distilling, and the shipping of coal and iron; and in summer it is considerably resorted to as a convenient watering-place. It unites with Kinghorn, Dysart, and Kirkealdy to send one member to parliament. Pop. '71, 3422.

BURNT OFFERING. See SACRIFICE.

BURNT SIENNA, a fine orange-red pigment, transparent and permanent, used both in oil and water-color painting. It is obtained by simply burning the ferruginous

ochreous earth known as Terra di Sienna. Excellent greens are produced by mixing it with Prussian blue. It mixes well with other pigments generally, and dries quickly.

BURNT STONES, antique carnelians found in ruins, and seeming to have been acted upon by fire, having a dull appearance externally, but exhibiting a beautiful red color when held up to the light. They are sold at a very high price, particularly if to the natural beauty of the stone is added the merit of fine workmanship. They were once, however, more esteemed than now, and an imitation of them, by burning the upper surface of carnelians with a hot iron, was very fashionable.

BURNT UMBER, a pigment of a russet-brown color, is semi-transparent, mixes well with other pigments, and dries quickly. It is obtained by burning umber, an ochreous earth containing manganese, and deriving its name from the place where it was first discovered—Umbria, in Italy.

BURNUGUR, a t. of India, in Guzerat, the territory of the Guicowar, 52 m. n. from Ahmedabad, in n. lat. 23° 48', e. long. 72° 38'. It is a place of considerable trade, which is mostly in the hands of wealthy Brahmans. Pop. 12,000.

BURR OAK, *Quercus macrocarpa* (Michx.), a valuable tree for timber, found in the Atlantic and western states; sometimes called the mossy-cup oak.

BURR, AARON, 1716-57; a Connecticut teacher and clergyman; in 1738, pastor of the Presbyterian church in Newark, N. J., and in 1748 second president of the college of New Jersey. He published a Latin grammar, several sermons, and *The Supreme Deity of Our Lord Jesus Christ Maintained*. His wife was a daughter of Jonathan Edwards.

BURR, AARON, son of the clergyman Aaron Burr; b. N. J., Feb. 6, 1756; d. N. Y., Sept. 14, 1836. He was left an orphan before the age of three; graduated at Princeton in 1772; in 1775, went into the army as a private; at Arnold's attack on Quebec, acted as aid to gen. Montgomery, and endeavored to bring off the body of that officer, who fell at his side. He acted as brigade-major to Arnold, and in May, 1776, he became a member of Washington's military family, which he left after a few weeks to become aid to gen. Putnam. In 1777, he was made lieut. col., and won distinction at Monmouth in command of a brigade. In 1778-79, he was stationed near New York, and was for a short time in command of West Point. He was always opposed to Washington, whose military talents he esteemed very lightly. B. resigned in consequence of ill health in the spring of 1779, and three years later married Mrs. Prevost, the widow of a British officer, was admitted to the bar, and began the practice of law at Albany, N. Y. In 1784, and again in 1798-99, he was elected to the state assembly. In 1789, he was appointed attorney-general of the state, and in 1791 was chosen U. S. senator. He was an early, zealous, and unscrupulous partisan leader among the "republicans" (afterwards "democrats"), and the especial rival of Alexander Hamilton, the prominent leader of the federalists. In the presidential struggle of 1800, John Adams (then president), Thomas Jefferson, Charles C. Pinckney, and B. were the candidates, and the votes for Jefferson and B. were equal—73 for each. As the constitution then provided, the person having the greatest number of electoral votes was to be president, and the next highest was to be vice-president. This equal division devolved upon the house of representatives the settlement of the matter, and there each state had one vote only, a majority of all the states being necessary to elect. After a week of balloting, Jefferson was selected the president, B. being vice-president. He had been favored by Jefferson for that place from the first, but his ambition was higher, and he did his utmost to defeat Jefferson, who was the regular candidate of the party. This course politically ruined B.; he was thereafter trusted by no party, though in 1804 the federalists nominated him for governor of New York, the result being his defeat by Morgan Lewis. These disappointments and defeats, added to the intensely bitter character of the partisan warfare of the time, led to the duel (July 11, 1804) in which Hamilton was killed by Burr. For this act, which was then deemed little less than murder, B. was legally disfranchised in New York, and covered with the heavier curse of popular indignation. In the spring of 1805, he started for the western part of the country, bent, as was generally believed, upon establishing a government in the Mexican territories, and possibly comprising a portion of the Louisiana purchase. He bought a large tract of land on Red river, and intimated that the conquest of Mexican states was a part of the plan. It was in the course of these operations that he plundered the famous Blennerhassett (q. v.). President Jefferson caused him to be arrested (Feb. 19, 1807, in Alabama) on a charge of treason, for which he was tried the next month at Richmond, Va. The jury gave a verdict of acquittal, and the next year he visited Europe to raise the means for an attempt upon Mexico. Four years of effort amounted to nothing, and in 1812 he returned in extreme poverty, and began to practice law in New York; but his course had alienated the people, and he could never regain his position in the courts. At the age of 78 he married Madame Jumel, a widow, who had a large estate in the upper part of the city of New York; but they were soon afterward divorced, and B. died in 1836 on Staten island in poverty and utter abandonment, not only because of his political course, but more in consequence of his social character. He had but one legitimate child, a daughter named Theodosia, who became

the wife of Joseph Allston, governor of South Carolina. This daughter was probably the only human being except himself whom B. ever really loved; and she sailed from Charleston in the spring of 1812 on a visit to her father (who had just arrived from Europe), but the schooner on which she was a passenger was never afterwards heard of. There have been many stories told of its fate, and three or more dying prisoners have given relations of their part in the robbery and destruction of the vessel, but none have proved trustworthy. The most probable theory is that the schooner foundered off Cape Hatteras in a furious storm that came soon after she sailed.

BURRANPOOTER. See **BRAHMAPUTRA**, *ante*.

BURRIUS, or **BURRUS**, **AFRANIUS**, d. 62 A. D.; a Roman prætor who promoted Nero's advancement to the throne. With Seneca's assistance, B. successfully resisted many of Nero's tyrannous acts; he opposed the murders planned by Agrippina, but would not become Nero's accomplice in her assassination or in that of Octavia. This is one story; but another is that he congratulated the royal monster upon the murder of his mother, and had his share of the spoils of Britannicus.

BURRIANA, a t. of Spain, in the province of Castellon-de-la-Plana, about 8 m. s. from the town of that name, is situated on the left bank of the Rio Secco, about 1 m. from its mouth in the Mediterranean. It has a pop. of 6200, who are chiefly engaged in agriculture and fishing; and exports wine, oil, and fruit.

BURRILL, **JAMES**, LL. D., 1772-1820; b. R. I.; graduated at Brown university, and in 1791 began practicing law. From 1797 to 1813, he was attorney-general of Rhode Island; in 1816, chief-justice; and in 1817, senator in congress, where he was an able opponent of the Missouri compromise.

BURRITT, **ELI**, a distinguished advocate of the doctrines of the peace society, and widely known as "the learned blacksmith," was born at New Britain in Conn., United States, in 1811. He was brought up to the trade of a blacksmith, but devoted all his leisure to study, especially to mathematics and languages. In the latter field of study, his range has been very wide, embracing more or less Latin, Greek, Hebrew, Arabic, and other oriental tongues, and almost all modern European and Slavonic languages. He is, however, much better known to the world as an earnest apostle of peace than as a scholar. To preach the doctrine of "universal brotherhood," he has traveled through Europe and the United States. His chief works are *Sparks from the Anvil*, *Olive Leaves*, *Peace Papers*, and *Lectures and Speeches*. He has taken a prominent part in the peace congresses of Brussels, Paris, Frankfort, London, and Edinburgh; and in advocating an ocean penny-postage. For many years he resided in England, part of the time as U. S. consul at Birmingham. He d. 7th Mar., 1879.

BURROUGHS, **GEORGE**, a graduate of Harvard, and preacher in Falmouth, Mass., in 1676, and in Salem in 1680. He was accused of witchcraft in have "tortured, afflicted, pined, consumed, wasted, and tormented" one Mary Wolcott. Though a man of the most unblemished character, he was condemned and hung at Salem, Aug. 19, 1692.

BURROUGHS, **STEPHEN**, 1765-1860; a native of New Hampshire, who ran away from home when but 14 years of age and joined the army; deserted; became a student at Dartmouth college, where he committed various offenses and escaped; served for a time on a privateer; practiced medicine; taught school; officiated as pastor of a Congregational church until he was convicted of passing counterfeit money and imprisoned at Northampton. He set fire to the jail in hope of escaping, but did not succeed, and was sent to Castle island in Boston harbor, to a prison from which he escaped, with seven others, only to be recaptured. When finally released, he went to Canada, and was for years the chief of a band of counterfeiters. Late in life he was converted and became a member of the Roman Catholic church and a private teacher for the sons of wealthy citizens; and, it is said, "was esteemed and respected by all." His *Memoirs of My Own Life* was once as popular as the life of Jack Sheppard.

BURROWING OWL, or **COQUIMBO OWL**, *Athene cucularia*, a species of owl that lives in the burrows of the prairie dog, or digs a home for itself; and seeks its prey (chiefly small insects) in daylight rather than like other owls in the night.

BURROWS, **WILLIAM**, 1785-1813; entered the U. S. navy in 1779, and served on the Barbary station. In the war with England he commanded the *Enterprise* in the engagement with the *Boxer* off Portland, Me., Sept. 5, 1813. The *Boxer* was taken; but B. was mortally wounded, living only long enough to receive the surrender. The English commander was also killed, and both officers were buried near each other at Portland.

BURRSTONE. See **BURSTONE**, *ante*.

BURSARY (Fr. *bourse*, Lat. *bursa*, a purse), the annual proceed of a sum permanently invested for the maintenance of a student at a university. A number of small bursaries were till lately the only equivalents at the Scotch universities for the scholarships of the English. Their large number and the small amount of each was, in course of time, found to have a prejudicial effect, more particularly at Aberdeen, which possessed the largest number, and where a practice had obtained of multiplying bursars on the

foundation, at the discretion of the senatus or patrons. Both the university commissioners of 1831 and those of 1863 expressed their opinion that it was less provision for encouraging learning in its earlier stages than adequate inducements to persons who have passed the preliminary class to make learning the business of their lives, that was wanted in Scotland. The general effect of the ordinances issued by the commissioners of 1863, in carrying out the directions of act 21 and 22 Vict. c. 83, was to consolidate some of the smallest bursaries into others of greater value, and in some instances to remove restrictions that had proved injurious, while a large number was thrown open to competition. There are, however, still a large proportion of purely presentation bursaries, and in some there is a preference given to a particular name, or to natives of a particular district. At Aberdeen, the commissioners founded eight scholarships of £65 annual value; at St. Andrews they so modified the Ramsay foundation as to found two scholarships of £60; and in Edinburgh they acquired funds sufficient to establish the Pitt and Mackenzie scholarships of £60 and £120 annual value. Since 1863, a large number of scholarships, tenable by graduates, and fellowships, have been founded by private individuals on a more liberal scale than the old bursaries, particularly in Edinburgh and Glasgow. At Edinburgh there are at present about 200 bursaries, of which above 100 are in arts, and 30 in theology; they vary in amount from £2 15s. 6d. to £100. Among the most considerable of them are two of £90, founded in 1809 by Dr. Donald Grant, for students of his own surname; one founded by sir John Macpherson in 1821, worth £88, for Highland students; the Jardine competition bursary of £40, four Lennie bursaries of £48, four Bruce bursaries of £30, and three of £40; two competition bursaries of £100 and £50 respectively, founded in 1860 by Mr. Patrick of Roughwood, for young men educated in Ayrshire; two bursaries founded in 1865 by Miss Scott of Horsehill, and one by Miss Harrison in 1867, for £40 each; and two founded by the Rev. John Spence in 1867, for £50. The scholarships for graduates are about 30, varying in amount from £60 to £120; and there are about eight fellowships varying from £100 to £160. Of 190 bursaries at Glasgow, many of them small, the most considerable are six founded by lord Dundonald in 1672, four in philosophy and two in divinity, of £40; two by Mr. Patrick, of £100 and £50 respectively; and the Brisbane medical bursary of £50, founded in 1877. Glasgow has also 14 exhibitions to Balliol college, Oxford, on 30 scholarships of from £50 to £200, the highest being the four founded by George A. Clark, in 1872. At St. Andrews there are 81 bursaries belonging to the United college, varying in amount from £5 to £50; 20 belonging to St. Mary's, varying from £6 to £50; and 20 of the same value transferable from the United college, when the bursars proceed to the study of divinity; two Ramsay scholarships of £50; one Guthrie scholarship worth £100 the first year, and afterwards £50; one Patrick Kidd scholarship, worth about £40; and two scholarships of £50, founded by Mrs Tyndal Bruce. At Aberdeen there are about 250 bursaries, varying from £5 to £50; and 11 scholarships of £65 to £70, tenable for 4 years, also some valuable exhibitions to Cambridge.

BURSCHENSCHAFT, an association organized by German students for the purpose, originally, of reforming the excesses and outrages customary at the universities of Germany, and to arouse a spirit of nationality by uniting the students of different universities. The first organization of the B. took place at Jena in 1815, and most of the students who became members had fought in the German war of independence; during 1815-17 it spread to Tübingen, Heidelberg, Halle, and Giessen. As it was evident that the students were to be disappointed in the hope that the war would be followed by political reforms, the B. of Jena decided to have a general gathering of the associations, which took place at the Wartburg, Oct., 1817. At this festival all the universities were represented, and in Oct. of the following year, delegates from 14 universities adopted a constitution, which was agreed to by all except the universities of Austria, Göttingen, and Landshut; they adopted the colors of the German empire, black, red, and gold, and resolved to hold annual conventions. In 1819, Kotzebue, the German dramatist, who had been declared by the B. a traitor to his country, was assassinated by Sand. After a conference at Carlsbad, the German government took steps to suppress the B., but without avail; it resulted only in their holding secret instead of public meetings. The original plan of a national B. was revived in 1827; the chief obstacle was the difference of view held by the Germanen, who desired to bring about the unity of Germany by practical and political means, and the Arminen, who laid more stress on the ideal unity of their country and the cultivation of individual powers. The views of these two parties were discussed at the convention of Bamberg in 1827, and in Frankfort in 1831; and, although the Arminen had the larger number of followers, they were obliged to give way to the more energetic Germanen. On the 25th of Dec., 1832, the B. resolved to attain the freedom and unity of Germany by a revolution; all the students were called upon to support the B., whose headquarters were at Frankfort-on-the-Main. The attempt was made at Frankfort in June, 1833, in which nearly 2000 students were implicated. It resulted in the arrest and prosecution of students at all the German universities, and many of them were imprisoned and disfranchised. The students of Vienna, who had never before been connected with the B., took a prominent part in the revolution of 1848.

BURSLEM, a t. of Staffordshire, on the Trent and Mersey cana., in the pottery district, is a station on a branch of the North Staffordshire railway. It forms part of the parliamentary borough of Stoke-upon-Trent. Pop. '71, 25,562. The abundance of coal and the variety of clays have made B., since the 17th c., one of the chief seats of the fictile manufacture. Porcelain and pottery of all kinds—Parian, iron and stone ware, etc.—are produced on a large scale, as well as encaustic tiles. There is also a glass manufactory here. The affairs of the town are managed by a "local board of health." At Birche's Head, a mile and a half from B., stands a large service reservoir of the Staffordshire waterworks company, from which the town and neighborhood are supplied with excellent water. A fine new town-hall was erected in 1865, which, besides the usual municipal offices, contains lecture rooms and news rooms. B. was the native place of Josiah Wedgwood, who in the middle of the 18th c. greatly improved the manufacture of pottery. A Wedgwood memorial institute has recently been erected, to serve as a school of art, a free library, and a museum. An appropriate character is given to it by introducing into the ornamentation of the façade terra cotta moldings, Wedgwood's jasper ware, etc.

BURT, a co. in e. Nebraska, on the Missouri river; 500 sq. m.; pop. '76, 4354; in '80, 6977. The Omaha and Northwestern railroad passes through it. Agriculture is the chief business. Co. seat, Tekama.

BURTON, ASA, D.D., 1752–1836; a graduate of Yale in 1777; in 1779 settled as pastor of a Congregational church in Thetford, Vt., where he remained all his life. He published many sermons, and *Essays on Some of the First Principles of Metaphysics, Ethics, and Theology*.

BURTON, JOHN HILL, advocate (member of the Scottish bar), has achieved for himself a place in the world of letters by a variety of works, all remarkable for ability, and several for original thought. B. was born at Aberdeen on the 22d of Aug., 1809; his father was an officer in the army, and his mother the daughter of an Aberdeenshire laird. Having graduated at Marischal college, Aberdeen, he became an apprentice to the profession of law in his native city; which, however, he afterwards abandoned for the higher sphere of the Edinburgh bar. Here, with time on his hands, he devoted himself to study and letters. For a long series of years, from 1833 downwards, he was a contributor to the *Westminster Review* of articles on law, history, and political economy; and for several years he contributed to *Blackwood's Magazine* literary sketches. Among his original works may be mentioned, *The Life and Correspondence of David Hume*, 2 vols. (1846); *Lives of Simon Lord Lovat and Duncan Forbes of Culloden* (1847), both excellent biographies; *Political and Social Economy* (1849), which is a valuable, condensed, and lucid contribution to the literature of social science; *Narratives from Criminal Trials in Scotland*; *A Manual of Scottish Law*; *A Treatise on the Law (Scottish) of Bankruptcy*; *The History of Scotland from the Revolution to the Extinction of the Last Jacobite Insurrection*, 2 vols. (1853); *The History of Scotland from Agricola's Invasion to the Revolution of 1688*, 7 vols. (1867–70); *The Book-Hunter* (1862); *The Scot Abroad*, 2 vols. (1864); *The Cairngorm Mountains* (1864). A new edition of the *History of Scotland*, enlarged and partly rewritten, appeared in 8 vols., 1873. He has edited vols. i. and ii. of the *Register of Priory Council (Scotland)* for 1545–78; and is about to bring out a history of the reign of queen Anne. The high merits of B.'s historical works have been universally admitted. He has further edited the works of Jeremy Bentham (nominally in conjunction with the late sir John Bowring), with an able introduction; and has published a volume of *Benthamiana*. B. was, in 1854, appointed secretary to the prison board of Scotland; and on the abolition of that board in 1860, he remained as stipendiary manager and secretary in connection with the Home office. On the passing of the prisons (Scotland) act, 1877, B. was appointed one of the prison commissioners for Scotland. He holds the old office of historiographer royal for Scotland, is LL.D. of Edinburgh university, and D.C.L. of Oxford.

BURTON, RICHARD FRANCIS, one of the most daring and successful of modern travelers, was b. in 1821 in Norfolk. He is the son of col. J. N. Burton, and was educated in France and England. In 1842, he entered the Indian army, and served many years in Sindh. While in this employment, he exhibited a remarkable facility in acquiring the eastern languages, and a still more remarkable dexterity in imitating the appearance and habits of the natives of India. In 1851, he published his first important work—*Sindh, and the Races that inhabit the Valley of the Indus*—full of graphic description, and interesting to all readers. B. had acquired a very familiar acquaintance with Hindustani, Persian, and Moulani. He had devoted special attention to Arabic, and had made such progress as to be able to speak it like a native. Possessed of these qualifications, he resolved to explore Arabia in the disguise of an Afghan pilgrim; and after a visit to England, he set out on his journey. Political commotions prevented him from traversing the whole country, as he intended; but his *Personal Narrative of a Pilgrimage to El Medinah and Meccah* (1855) records one of the most daring feats on record. A perpetual strain on the ingenuity was necessary to keep up his assumed character, most difficult in moments of fatigue, and in the midst of shrewd and observant fellow-travelers. The next journey undertaken by B. was into the country of the Somaulis, in eastern Africa. It proved less successful than was anticipated. B.'s com-

panion, lieut. Stroyan, was killed, and B. himself was wounded. He succeeded; however, in reaching Harar (q.v.), a most important town in eastern Africa, not before visited by any European, and in penetrating a vast and populous region scarcely known to geographers. The journey led to a still more important series of expeditions—those to the country of the upper Nile. Towards the end of 1856, B. set out in company with lieut. Speke, also of the Indian army, to ascertain the truth of the reports collected by the missionaries, that a vast sea existed in the heart of the continent. The journey is one of the most memorable of our time. It led to the discovery and exploration of the great lake of Tanganyika, and the opening up of the eastern part of the continent. B. was rewarded with the medal of the geographical society. His health had been affected by his African journeys, and he sought to recover it by a journey in North America, from which he brought the first reliable account of the Mormons. In 1861, B. was appointed consul at Fernando Po, on the w. coast of Africa, and while holding this appointment, he visited the Cameroon mountains, and went on a mission to the king of Dahomey, the incidents of both journeys being recorded in two of his most interesting works. B. has subsequently been consul at Santos in Brazil, and at Damascus; and on the death of Mr. Charles Lever in 1872, B. succeeded him in the post of British consul at Trieste.

The following is a list of the principal works of capt. B. not mentioned above: *Sindh, or the Unhappy Valley* (1851); *Gou and the Buc Mountains, or Six Months of Sick Leave* (1851); *Fulcroy in the Valley of the Indus* (1852); *First Footsteps in East Africa, or an Exploration of Harar* (1856); *The Lake Regions of Central Africa, or a Picture of Exploration* (1860); *The City of the Saints, and Across the Rocky Mountains to California* (1861); *Abokuta, or the Cameroon Mountains* (1863); *The Nile Basin; A Mission to Gelele, King of Dahomey, with Notices of the so-called Amazons, etc.*; *Explorations in the Highlands of Brazil; Vikram and the Vampire; Zanzibar; Two Trips to Gorilla Land; Ultima Thule, or a Summer in Iceland; Etruscan Bologna* (1876); *Sindh Revisited* (1877); *The Gold Mines of Midian and the Ruined Midianite Cities* (1878), giving an account of B.'s investigations in that region during journeys in 1876 and 1877.

BURTON, ROBERT. author of the *Anatomy of Melancholy*. was b. at Lindley, in Leicestershire, in 1576, and studied at Brasenose and Christ church, Oxford. In 1616, he was appointed to the vicarage of St. Thomas, and in 1628, to the rectory of Segrave in his native county. He appears, however, to have continued all his life at Christ church, where he died in 1640, leaving legacies of £100 each to the Bodleian and Christ church libraries, and as many of his books as they did not already possess. A monument was erected to his memory in Christ church cathedral. B. is described by Anthony Wood as a good mathematician, a dabbler in nativities, a well-read scholar, and a thorough-paced philologist. "As he was by many accounted a severe student, and a melancholy and humorous person, so by others who knew him well, a person of great honesty, plain-dealing, and charity. I have heard some of the ancients of Christ church often say that his company was very merry, faceté, and juvenile." His *Anatomy of Melancholy*, in which he appears under the title of Democritus Junior, is one of the most curious *melanges* of heterogeneous elements ever put together. It consists mainly of an extraordinary mass of quotations from old and obscure writers, stung on a thread of rambling reflection: often tiresomely pedantic, but relieved by quaint touches of humor and feeling. In his own life-time, it was highly popular, and went through five editions; after that, it fell into comparative oblivion, but is now again popular among lovers of quaint literature. Dr. Johnson said it was the only book that ever took him out of bed two hours before his usual time.

BURTON, WILLIAM EVANS, 1804-60; b. London; son of William George B., author of *Biblical Researches*. He was intended for the church, and received a classical education; at 18 took charge of his father's printing establishment and edited a magazine. From amateur acting he drifted towards the regular stage, and made a successful début at the Haymarket, in 1832. He began also to write dramas, one of which was played simultaneously at five London theaters. In 1834, he came to the United States, where he was always prominent as actor or manager, chiefly in Baltimore, Philadelphia, and New York. In Philadelphia he established the *Gentleman's Magazine*, a literary monthly. His greatest success was in the management of the Chambers street theater, New York, where, with Brougham and others, he produced dramas from several of Dickens's novels. His own forte was low comedy, and some of his characters were so established in public favor that no actor has satisfied an audience in them since his death. Such were "Captain Cuttle," "Toodles," "Micawber," "Aminadab Sleek," "Paul Pry," and others. He was a fine scholar, and had a superior library, particularly of Shakespearian literature. He was for several years the editor of the *Literary Souvenir*, and published in two vols. a *Cyclopadia of Wit and Humor*.

BURTON-ON-TRENT, a market t. in Staffordshire, on the river Trent and the Midland railway. The Grand Trunk canal also passes the town, and enters the Trent below. A bridge of 34 arches, built before the Norman conquest, here crossed the river, but was replaced in 1864 by a new one of 29 arches. The population of B. has been nearly trebled within the last 20 years, being, in 1871, 20,378. This is owing to the rapid extension of the brewing of ale, which is the staple product of the place. There

are upwards of 80 breweries in B., some of them on a scale of unparalleled magnitude. The two establishments of Bass and Allsopp cover together more than 250 acres of ground, and can produce yearly about two million barrels of ale. There are, of course, extensive cooperages, and also iron-foundries. The public edifices are not particularly noticeable.

BURTSCHIED, or **BORCETTE**, a t. of Rhenish Prussia, about half a mile distant from Aix-la-Chapelle, with which it is connected by an avenue of trees. It has manufactures of woollen cloths and cassimeres, and celebrated sulphur springs and baths, with a temperature of 106° to 155° F. Pop. '75, 10,220.

BUR'WHA, or, as Dr. Barth spells it, **BARUWA**, a t. of Bornu, central Africa, situated on the w. bank of lake Tchad, about 80 m. n.n.w. of Kuka. The town, which consists of closely packed huts, is surrounded by high clay walls, which, however, "owing to the high mounds of rubbish imbedding them on all sides," afford no protection whatever from the attacks of the Tawarek, to whom the inhabitants have to pay tribute. Fish in great quantities are caught in the adjoining lake, and form the chief food of the inhabitants, as well as their only article of commerce. Pop. about 6000.

BURY, a flourishing manufacturing t. in the s.e. of Lancashire, on a rising ground backed by hills on the n. and e., between the Irwell and the Roche, 9 m. n.w. of Manchester. It was early a seat of the woollen manufactures, carried on by Flemings, but these, though still considerable, now yield in importance to those of cotton. Besides spinning and weaving factories, there are important print, bleach, paper, and dye works, and some large foundries and engine manufactories. In the vicinity are excellent free-stone quarries, and abundant coal-mines. The town has recently been much improved in drainage, and an ample supply of water has been secured from hills at a distance. Pop. '71, 41,344. B. returns one member to parliament. Some improvements in the cotton manufacture arose here—notably, the invention by John Kay of the fly-shuttle. The late sir Robert Peel was born in B., where his father established his great print-works. A bronze statue of sir Robert has been erected in the old market-place.

BURYING BEETLE, *Necrophorus*, a genus of coleopterous (q.v.) insects, of the tribe or family *silphites*, with short cub-shaped antennæ, remarkable for their habit of burying the bodies of mice, moles, and other small animals, in order to deposit their eggs in them, and to provide a supply of food for their larvæ. Some of the species are natives of Britain, among which is *N. vespillo*, the species of which the habits were first observed, which is, however, more common in some parts of continental Europe. It is a black beetle, about an inch long, with two bright orange bands across its back, and having an excessively fetid smell, which long adheres to whatever it touches. Its sense of smell would seem to be extremely acute, and a dead animal soon attracts it, a pair generally arriving together, male and female, to feed upon the body, and the male to proceed to its interment, if sufficiently small, previous to which, however, they have sometimes to drag it to some distance to a place suitable for their purpose. The head of the insect is the only tool employed in the operation, and is held sloping outwards, and employed in a manner which exhibits great muscular power. A furrow is first made around the body, then another within the first, and so on till the earth is so excavated from beneath, that the body begins to sink, when the insects, by great efforts, drag it down into the hole, and when it is fairly in, the excavated earth is thrown back over it. The female then lays her eggs in it; and when this is accomplished, and the cravings of appetite are satisfied, it is left for the larvæ, which are of a lengthened form, with six feet, whitish, and a brown head.—The known species of B. B. are mostly native of Europe and of North America.

BURY ST. EDMUNDS, or **ST. EDMUNDSBURY**, an ancient borough in Suffolkshire, on the Upper Lark, 26 m. n.w. of Ipswich. It is well built, and delightfully situated. Pop. '71, 14,928. It returns two members to parliament. It has a trade in wool, butter, corn, and cheese, but no manufactures. A very complete system of drainage has been carried out, the sewage being conveyed to a distance, and, by means of pumps, applied to irrigation. A new corn exchange was erected in 1862; in 1864, the Suffolk general hospital was rebuilt. B. received its name from Edmund, the Saxon king and martyr, who was crowned here on Christmas day, 856; taken prisoner, and put to death by the Danes. On the site of his tomb, six priests founded a monastery; and here Canute raised a Benedictine abbey, which in time became the richest and most important in England, save that of Glastonbury. From 1020 to its dissolution by Henry VIII., it was ruled over by a line of 33 abbots. The abbot was a spiritual baron of parliament, had judicial authority in all causes within the liberty of B., had the power of inflicting capital punishment, and the privilege of coining. At the dissolution, the annual income was equivalent to £50,000 of our money. Of this magnificent establishment, little now remains but the western gate, erected in 1327, a noble relic of the decorated Gothic style; and the "church-gate," a quadrangular tower of massive simplicity, 86 ft. high. The churchyard, to which this tower formed the portal, includes, besides the abbey ruins and some other buildings, the fine old churches of St. Mary and St. James. The celebrated grammar-school of B. was founded by king Edward VI. in 1550, and is free to sons of the inhabitants of the town. It has 2 scholarships at Cambridge, and 6

exhibitions to each university, and has produced many eminent scholars. Among the many religious and charitable institutions connected with the abbey, of which portions still exist, is St. Saviour's hospital, founded by that notable abbot, Samson, whose life and actions, as recorded by Jocelyn of Brakelond, Mr. Carlyle has so vividly recalled in his *Past and Present*. The poet Lydgate was a monk in this abbey; and sir Nicholas Bacon was born here. At B., king John first met his indomitable barons before he signed Magna Charta. Parliaments were held here in 1272, 1296, and 1446, the last of which ordered the arrest of Humphrey, the good duke of Gloucester, who was found dead in his bed the morning after his arrest; and sovereigns, as late as Elizabeth's time, were often nobly entertained at St. Edmund's town. Three m. s.w. of B., the Marquis of Bristol has a splendid seat, Ickworth park, a circular pile 90 ft. in diameter, and 140 ft. high.

BUSACHI NO, or **BISAQUINO**, a t. of Sicily, in the province of Palermo, about 29 m. s.s.w. of the city of that name. It has manufactures of linen, and a population of 9100.

BUSA'CO, a ridge or serra on the n. side of the river Mondego, in the province of Beira, Portugal, about 20 m. n.n.e. of Coimbra. Here Wellington, with about 40,000 British and Portuguese troops, repulsed the attack of Massena with 65,000 French, 26th Sept., 1810. Unable to force the position, Massena turned it by a pass over an adjoining ridge, and Wellington retired behind the lines of Torres Vedras, which indeed it was his intention to do, even if there had been no battle.

BUSBECQ, **AUGIER GHISLEN DE**, a Flemish diplomat, 1532-92. He was engaged in many important negotiations, and twice sent by the emperor Ferdinand I. to the court of Constantinople. In 1562, he was made tutor to Maximilian II. in Vienna. He wrote *Discourse of the State of the Ottoman Empire*, and a *Relation of My Two Journeys to Turkey*.

BUSBY, **RICHARD**, the most famous of English schoolmasters, was b. at Lutton, Northamptonshire, Sept. 22, 1606. Educated at Westminster school, and Oxford, he was, in 1640, appointed headmaster of Westminster school, the duties of which office he continued to discharge until his death in 1695. He is the type of pedagogues alike for learning, assiduity, and the application of the birch. He was a most successful teacher, and at one time could point to no less than sixteen occupants of the bench of bishops who had been educated in his school; and altogether, he has the reputation of having "bred up the greatest number of learned scholars that ever adorned any age or nation." He published several works, but they were chiefly for school use.

BUSCA, a t. of Piedmont, situated on the left bank of the river Maira, an affluent of the Po, about 9 m. n.w. of Coni. Excellent wine is produced in the vicinity. Pop. 9375.

BUSCH, **JOHANN GEORG**, 1728-1800; a German philanthropist and statistician, professor of mathematics in the Hamburg gymnasium. He established an association for the promotion of art and industry, and a school of trade, the latter becoming especially famous. He wrote largely upon the history and theory of trade and commerce, and on questions of political economy.

BÜSCHING, **ANT FRIEDR**, a celebrated geographer, was b. 27th Sept., 1724, at Stadthagen, in the principality of Schaumburg-Lippe, Germany. He studied theology at Halle, where he enjoyed the friendship of Baumgarten. In 1754, he was appointed extraordinary professor of philosophy in Göttingen, but soon incurred the displeasure of the Hanoverian government by his religious heterodoxy. Göttingen thus becoming an unpleasant residence to him, he accepted an invitation, in 1761, to St. Petersburg as preacher to a Protestant congregation there. In 1765 he returned to Germany, and in 1766 was called to Berlin as upper consistorial counselor and director of a *gymnasium* in Berlin, where he died, 28th May, 1793. Until the appearance of B.'s *Erdbeschreibung*, the first volume of which was published at Hamburg in 1754, neither Germany nor any other nation possessed a geographical work which made any pretension to scientific treatment or completeness of execution. The changes in the political arrangements of the world have, however, deprived the work of its original value, but it has been corrected and edited by subsequent writers. Of his other numerous publications, the most important is the *Magazin für Historie und Geographie* (25 vols. Hamburg, 1767-93).

BUSEMBAUM, **HERMANN**, a theologian of the order of Jesuits, was b. in 1600 at Nottelen in Westphalia. About 1640, he taught ethical philosophy at Cologne, and later was appointed rector of the college of Jesuits at Münster. He died 31st Jan., 1668. His work entitled *Medulla Theologiæ Moralis* (1645), was celebrated as a standard authority in the seminaries of the Jesuits, though several of its propositions were condemned by the pope. It has gone through more than fifty editions. It was enlarged by the Jesuit Lacroix (1707), and re-edited, with improvements and additions, by the Jesuit Montausan in 1729, and again by Alfonso de Ligorio in 1757. As it was found that the work contained doctrine in favor of regicide, it was burned, by order of the parliament of Toulouse, on the occasion of an attempt made on the life of Louis XV. by Damiens in 1757. Subsequently, the Jesuits Zachariah and Franzoja of Padua wrote in defense of B.'s work.

BUSENTO, a river of Salerno, Italy, emptying into the bay of Busento. This is the stream that was turned from its channel by the followers of Alaric, who buried that great leader in the original bed of the stream and then restored the water to its natural course so that no enemy could find the grave.

BUSH, GEORGE, D.D., 1796-1859; b. Vt.; a graduate of Dartmouth college and Princeton seminary; ordained in the Presbyterian church, and four years a missionary in India. In 1831, he was appointed professor of Hebrew and oriental literature in New York university. In 1832, he published a *Life of Mohammed*, and the next year a work on the millennium, in which he held that the beginning of the millennial age was marked by the triumph of Christianity over Roman paganism. He also wrote a Hebrew grammar, and seven volumes of commentary on the Old Testament. In 1844, he conducted *The Hierophant*, devoted to the explanation of prophetic symbols, and published a work in which he opposed the idea of a physical resurrection of the body. In 1845, he united with the New Jerusalem church, and began to translate Swedenborg's works. In support of these doctrines, he edited the *New Church Repository*. His latest work was *Priesthood and Clergy unknown to Christianity*.

BUSH ANTELOPE, BUSH BUCK, and BUSH GOAT, names common to a number of species of antelope (q.v.), natives chiefly of the southern and western parts of Africa, forming a section of the genus *antelope*, which some naturalists have attempted to erect into a distinct genus (*philatomba* or *cephalopus*). They are animals of more compact form, shorter limbs, and greater strength, but much less agility, than the true or typical antelopes. They are remarkable for the arched form of the back. They have short, straight, or slightly curved horns, situated far back, and generally peculiar to the male sex, with usually a long tuft of hair between them. They have no tear-pits, but instead of them, a naked glandular line, formed of two series of pores, on each cheek. They frequent jungles, thick forests, and beds of reeds, and when pursued, seek to escape by diving into a thicket. The common or white-backed B. A. of Sierra Leone (*antelope sylvicultrix*) is about 3 ft. high at the shoulder; it is a dull, heavy, awkward-looking animal; keeps concealed in the thickets during the day, living singly or in pairs, and feeds in the open spaces in the early mornings only. To shoot it, sportsmen place themselves on the margin of the woods, and watch their opportunity as it comes out to graze. Its flesh is more esteemed than that of the more agile antelopes. Nearly 20 other species are usually ranked in this section of antelopes, among which is the *kleene boe* (*antelope pygmaea*) of s. Africa, a species abundant in many parts of Cape Colony, of very small size, not more than one foot in height at the shoulder, and with horns only about 1½ in. in length. It is a timid, gentle animal, easily domesticated. It differs from the typical bush antelopes in the great activity which it displays.

BUSHEAB, a low, flat island in the Persian gulf, about 11 m. from the Persian coast, in lat. 26° 50' n., long. 53° 12' east. It is about 18 m. long, narrow, and well-peopled, with a town and harbor at its western extremity. Its proper name is *Khoshaub*, signifying "good water."

BUSHEL [Fr. *boisseau*, allied to *boi(s)te*, box, butt; Lat. *butta*, a measure in general], a dry measure used in Britain for grain, fruit, etc. The quarter contains 8 bushels, and the bushel 8 gals., the gallon measuring 277.274 cub. in., and holding 10 lbs. avoirdupois of distilled water. Hence the imperial bushel contains 80 lbs. of water, and measures 2218.2 cub. inches. The old Winchester bushel measured 2150 cub. in.; hence 33 Winchester bushels. = 32 imperial bushels, nearly.

BUSHIRE. See **ABUSHEHR**.

BUSHMAN'S RIVER, or **BOS'JESMAN'S RIVER**, in the e. part of the Cape Colony, s. Africa, is about 200 m. long, and forms on its lower course the w. boundary of Albany, whose capital is Graham's Town. Its general direction is from n. to s., its mouth being about 33½° s., and about long. 26½° east.

BUSHMEN, or **BOSJESMANS**; so named by the Dutch colonists, but calling themselves **SAAB**, or **SAAN**; an aboriginal race of s. Africa, somewhat like, and yet differing from, the Hottentot, but like them having nothing in common with the Kaffer or negro. They rank with the savage of Australia among the lowest existing types of mankind, and are in a most degraded and destitute condition. They are of small stature, of dirty yellow color, and very repulsive features. The cheek-bones are large and prominent, the eyes deep set and crafty in expression, nose small and depressed, and the hair in small woolly tufts with bald spaces between. Of 150 measured by a traveler, the tallest man was 4 ft. 9 in., and woman 4 ft. 4 in. Some are well proportioned, active, and capable of enduring great privations and fatigue. Those furthest n., near lake Ngami, are considerably larger in body. They clothe in skins and are fond of ornaments, decorating their arms and legs with beads and rings, and the women sometimes paint their faces red. They dwell in huts of reed or in holes in the ground; in the mountain districts they live among the rocks with mats for shelter. They have no cattle, nor any animals except a few half-wild dogs, nor have they the least signs of agriculture; but as they live by hunting they are well acquainted with the habits of animals, and follow the herds of antelope in their migrations. Their weapons are bows and arrows, the latter tipped with bone or iron, and poisoned with vegetable matter

mixed with the venom of snakes or spiders, or the entrails of an extremely poisonous caterpillar are used alone. On account of the use of these fatal poisons the B. are held in dread by neighboring tribes. The discovery of their rude tools for digging tubers, scattered over wide regions not now occupied by them, indicates the existence of greater numbers of B. in earlier times. They have no approach to tribal organization, nor any chiefs; bodily strength forming the only distinction of superiority. Their various dialects are not understood by the Hottentots, the tongue of the latter being more agglutinative, that of the B. more monosyllabic; the Hottentots use gender in names, while the B. do not. The Hottentots can count 20; the B. only 2—calling all above that "many." The B. possess a pictorial faculty not known in any other south African tribe, and the rocks of the Cape Colony and Drakenberg mountains show many examples of Bushman drawings of men, women, children, and animals. Rings, crosses, and other signs, drawn in blue on rocks and stones, and believed to be centuries old, have given rise to the suggestion that these may be the remains of hieroglyphic writing; and the discovery of drawings of men and women with antelope heads, also very ancient, recalls the mythological figures of Egypt. The B. have a kind of intelligence, and are valued as servants by the Boers, being much more energetic than the Hottentots. A wholesale destruction of B. on the borders of the colony in earlier years, reduced their numbers greatly; and though this hunting of them has ceased, their children are still captured by the Boers for servants. The B. retaliate by ravaging the farms on the border and driving off cattle. As they once occupied a much larger area, it seems probable that the B. are the remains of the earliest aborigines of s. Africa, and that they existed there before the Kaffers, and perhaps before the Hottentots. A former and more general distribution of the race is indicated by the discovery in late years of undersized people near the upper Nile basin and on the western equatorial coast land by Dr. Schweinfurth and Du Chaillu.

BUSHNELL, HORACE, D.D., 1802-76; b. Conn., graduated at Yale in 1827, where he studied law and theology; in 1833, became pastor of the North Congregational church in Hartford. He was a voluminous writer on theological subjects; some of his works being *Principles of National Greatness; Christian Nurture; God in Christ; Christian Theology; Sermons for the New Life; Nature and the Supernatural; Work and Play; Christ and His Salvation; Woman's Suffrage, the Reform Against Nature; The Vicarious Sacrifice*. He was also a writer for various periodicals and newspapers. He was a bold and original thinker, with peculiar eloquence of style. Though strongly evangelical in belief, he denied the Calvinistic theory of the atonement (known as the "satisfaction theory"), and gave less than the ordinary emphasis to the distinction between the persons in the Trinity. These, with other divergences, led to his being accused of heresy; but ultimately the fellowship of the Congregational churches was found broad enough to include him, and he kept his standing therein with growing influence until his death. During his later years his health compelled his relinquishment of the active pastorate, but his labors in authorship were unintermitted. While his theory of the atonement has not commended itself in its exact form to the majority of evangelical Christians, and is adhered to by no organized sect or party, it cannot be denied that his moral earnestness, his spiritual power, his wondrous suggestiveness, his brilliancy of thought and style, and his broad mental scope, have profoundly modified the thinking of the present age through almost the whole circle of Protestant denominations. Indeed, with his detestation of all provincialism and sectarianism, he would have chosen any other form of influence rather than that which is exercised by the leader of a party in the church.

BUSHWHACKERS, a term much in use in the war of the rebellion (though well known before) to indicate men who pretended peace or neutrality, but who were ready to make secret attacks whenever opportunity offered. They were numerous in some western states, where many of them were summarily shot as outlaws.

BUSIRIS, an Egyptian t., capital of the B. nomos, in the hieroglyphic language, the "Place of Osiris," believed to correspond to the modern Abusir, and situated about the middle of the delta. It was supposed to be near the entrance of the gates of Elysium. Close to B. was the pyramid of king Sahura, of the 4th dynasty, known as the Sa-ba, or "pyramid of the rising soul." The shrine of the goddess Isis was in B. and a great annual festival and lamentation for Osiris was held there. The place was destroyed by Diocletian, but the Copts and Arabs have preserved the name in Bousiri and Abusir.

BUSIRIS, a mythical king of Egypt mentioned by the later Greek writers. After Egypt had been afflicted for nine years with famine, Phrasius, a seer from Cyprus, announced that the famine would not cease until a foreigner was annually sacrificed to Zeus. B. began by sacrificing Phrasius, and continued the custom yearly; but when he undertook to make a victim of Hercules the latter burst his bonds and with his club slew B. and his son Amphidamas. Attempts to find the place of B. as an actual king have not succeeded. There is no good reason to believe that human sacrifices were ever offered in Egypt.

BUSKIN, a kind of half-boot, lacing tight to the leg. The ancient tragedians wore buskins (*cothurni*), often with thick soles, to add to their stature. Hence the B. is often put for tragedy, as the sock (*soccus*, a flat soled shoe) for comedy. In ancient sculpture,

Diana, and hunters in general, as well as men of rank and authority, are represented in buskins often highly ornamented.

BUSS is the name of a small vessel, usually from 50 to 60 tons' burden, much used in the herring-fishery, especially by the Dutch. The B. has two small sheds or cabins—one at the prow, to serve as a kitchen, and the other at the stern. The remaining space is a receptacle for fish.

BUSSAHIR, a hill-state of Northern India, on the border of Chinese Tartary, in n. lat. 30° 56' to 32° 8', and e. long. 77° 34' to 78° 52'. It is one of the most elevated and mountainous countries in the world, the lowest part being more than 3000 ft. above the sea, and much of it from 7000 to 12,000 feet. The Sutlej flows through the country from e. to west. The district on the n. of the Sutlej is called Kunawur, that on the s. is B. proper. The climate in the lower parts on the southern frontier is almost tropical, and there are many genial and fertile districts of mild temperate climate; other districts are near, and within the limits of perpetual snow. The vine succeeds admirably in many places, and it is supposed that some parts of this state are extremely suitable for the culture of tea, which, indeed, is cultivated to some extent. Very rich deposits of copper ore have been discovered in Kunawur, and copper-mining is prosecuted near the s. w. frontier. The inhabitants are little advanced in civilization; many of those in the more northern parts have strongly marked Mongolian features. Polyandry prevails among them, and the females left unmarried take refuge in Lamaic convents. The rajah and upper classes in the southern parts are Rajpoots, and the people generally are of Hindu race. Their observance of Hinduism, however, is very partial. The rajah of B. holds his dignity by a grant from the East India company, made on the expulsion of the Ghoorkas in 1815. The tribute paid is £340. The pop. is estimated at 90,000. Principal productions are opium, grain, and woolen manufactures.

BUSSEY, BENJAMIN, 1757-1842; served as a private soldier in the revolutionary army; after the war, began business in Boston and accumulated a fortune, most of which, after the death of certain relatives, went to the support of the law and divinity schools in Harvard college, and the founding of a school of agriculture, for which special object he gave a large farm near Boston.

BUSSORA. See **BASSORA**, *ante*.

BUSSU PALM, *Manicaria saccifera*, a South American palm, growing in the tidal swamps of the Amazon, the only known species of its genus. The stem is only 10 to 15 ft. high, curved or crooked, and deeply ringed. The leaves are simple or undivided, and are the largest of the kind produced by any known palm, being often 30 ft. long, and 4 or 5 ft. wide. They are simply branched, drooping, and the fruit is of an olive color, large, hard, and three-seeded. The leaves make excellent and durable thatch, being split down the midrib, and laid obliquely on the rafters, so that the furrows formed by the veins lie in a nearly vertical direction, and serve as so many little gutters to carry off the water. The spathe, taken off entire, is used by the Indians as a bag, or the larger ones are stretched out to make caps.

BUST (Ital. *busto*; Fr. *buste*), in plastic art, the name given to a sculptural representation of the head and upper part of the human body. The earliest busts formed by the ancients were probably those heads of Mercury which, when elevated on tall square blocks of stone, received the name of *hermæ* (q. v.). These *hermæ* were afterwards frequently surmounted by representations of other divinities, such as Minerva; and as they gradually assumed more and more of the human form, they passed into busts, which were made of marble, bronze, etc. But it was not till very late in the history of art that busts, in the sense of portraits of individuals, came to be used, either in Greece or Rome; and it is remarkable that neither Greeks nor Romans designated them by any special name, for the Latin word *bustum* had a quite different meaning. It was not till Alexander's time that busts were used for purposes of portraiture in Greece; and most of the Roman busts which we possess belong to the period of the emperors. During the learned period of Greece, which commenced with Aristotle, portraits of men of letters formed an important department of art; and it became an object with the founders of museums and libraries to procure complete sets of them. The artists of this period exhibited remarkable ability in expressing the characters of the individuals whom they represented. In this way we have well-authenticated busts of Socrates, Plato, Zeno the Stoic, and other philosophers; of poets and orators, such as Isocrates and Demosthenes; of Athenian statesmen and distinguished women. In Rome, representations of the kings, and persons of distinction belonging to the earlier period, were probably made from the *imagines majorum* which every patrician preserved in his atrium, and which were commonly made of wax. These, no doubt, were often merely fanciful representations, partly taken, it may be, from the more prominent features which belonged to the existing members of the family. The earliest well-authenticated Roman B. which we possess, is probably that of Scipio Africanus the elder. During the empire, busts for the most part were accurate portraits, and still furnish us with the means of becoming acquainted with the features, not only of the emperors themselves, but of most other persons of distinction. Busts of poets and men of letters are far less frequently met with amongst the Romans than amongst the Greeks. The chief marks of the authenticity in these busts

are the names which very frequently are inscribed on them, and, where these are not found, the comparison which we are enabled to make between them and coins. Private collectors of busts were not unknown in antiquity, as, for example, M. Terentius Varro and Pomponius Atticus. In our own time, king Louis I. of Bavaria made, in his celebrated Valhalla, the most remarkable collection of busts which perhaps anywhere exists. The first complete collection of engravings from antique busts was made by Fulvius Ursinius in his *Illustrium Imagines* (Rome, 1569, and Antwerp, 1606). Recently, we have been indebted to Visconti's *Iconographie Grecque* (Paris, 1811) and *Iconographie Romaine* (Paris, 1817) for a similar collection.

BUSTAMEN'TE, ANASTASIO, 1782-1851; a physician of San Luis Potosi, Mexico. He was among the earliest supporters of Iturbide when the revolt against Spain began in 1821. In 1830, he became vice-president of the republic, exercising the full power of president. He resigned when Santa Anna's revolution of 1832 became successful, and the next year was exiled, living in Europe until 1836, but recalled after the downfall of Santa Anna, and in 1837 elected president. In 1846, he was president of the Mexican congress.

BUSTARD, Otis, a genus of birds, sometimes made the type of a family, *otidæ*, usually ranked in the order *grallæ* (q.v.). The general structure seems to agree best with that of the *grallæ*; but there are points of strong resemblance to gallinaceous birds, both in the appearance and habits of the bustards; while their power of running, and the use which they make of their wings to aid in running, are indicative of a relation to the *struthionidæ*, or ostrich tribe. They differ, however, from these birds in possessing wings quite capable of flight, although even when pressed by danger they often seek to escape by running, and the great B. of Europe has been pursued and taken by greyhounds.—Bustards are birds of bulky form, with long neck and long naked legs; the toes, three in number, all directed forward, short, united at the base, and edged with membrane; the wings rather rounded; the bill of moderate length, straight, or nearly so. They are mostly inhabitants of open plains, to which all their habits are adapted.—The GREAT B. (*otis tarda*) was at one time plentiful in some parts of England, and was also an inhabitant of the s.e. of Scotland; but extending cultivation, and the persecution to which it has been subjected, have now rendered it a very rare British bird. It is common in the s. and e. of Europe, and abounds in the wide steppes of Tartary. It is the largest of European birds, the male sometimes weighing nearly 30 pounds. The female is much smaller than the male. The plumage is of a pale chestnut color on the upper parts, beautifully varied with black—much white and black on the wings, the tail tipped with white. The tail is short, spreading, and rounded. A tuft or plume about 7 in. long, springing from the chin, passes backwards and downwards on each side, in the summer dress of the male, partly concealing a long stripe of bare skin on each side of the neck. The anatomy of the male exhibits a remarkable peculiarity in a large bag or pouch, capable of holding several pints, the entrance to which is between the underside of the tongue and the lower mandible. The use of this bag is unknown; but it has been conjectured to be for conveying water to the females and young, in wide, arid plains. The great B. feeds indiscriminately on animal and vegetable food, swallows frogs, mice, worms, etc., and is very fond of turnip-tops. Its flesh is highly esteemed for its flavor. It is polygamous. No difficulty is found in taming it, but all attempts to reduce it to a state of true domestication have hitherto failed, from its not breeding in the poultry-yard.—The LITTLE B. (*O. tetrax*), frequently in the s. of Europe and n. of Africa, is only an accidental visitant in Britain. It is not half the size of the great B.—The BLACK-HEADED B. (*O. nigriceps*) is found in large flocks in the open plains of the Mahratta country. Its flesh is esteemed one of the greatest delicacies which India produces.—The KORI B. (*O. kori*) of s. Africa, a magnificent bird, standing upwards of five ft. in height, has a similar reputation as one of the best kinds of game.—Australia possesses a B. (*O. Australasianus*) somewhat exceeding the great B. of Europe in stature. It is called wild turkey by the colonists of New South Wales. Its plumage is finely freckled or spotted; the prevailing color is brown. It has become comparatively rare in the more settled districts, its flesh being particularly delicate and well flavored, but may be seen stalking majestically in the grassy plains, wherever human footsteps are still rare.

BUSTO-ARSI'ZIO, a t. of northern Italy, in the province of Milan, and 20 m. n.w. from Milan. It stands in a fertile plain, which produces much wine. In one of the churches are numerous statues and fine paintings by Daniel Crespi, a native of the town. Remains of ancient buildings show that Busto-Arsizio was in ancient times of considerable importance. It is a place of active trade, and has a cotton-thread factory. Pop. of town and suburbs, 12,909.

BUTADES (wrongly called Dibutades), a Greek modeler in clay, described as the first who copied the human face in that material. Seeing on a wall a drawing in outline of his daughter's lover, B. molded the face of it in clay, and baked it with the tiles which it was his business to make. The incident led B. to ornament the ends of roof-tiles with faces, a practice largely imitated in after years. He lived about 600 B.C.

BUTCHER-BIRD. See SHRIKE.

BUTCHER'S-BROOM, *Ruscus*, a genus of plants of the natural order *liliaceæ*, with male and female flowers on separate plants, a perianth of six leaves, filaments united, one style, and the fruit a berry. The common butcher's-broom (*R. aculeatus*) is a shrubby or almost shrubby evergreen plant, with a biennial stem, 1 to 3 ft. high, sending out many short branches and ovate alternate sharp-pointed false leaves of the same substance as the branches, the flowers minute and arising from the disk of the false leaves, solitary; the berries red, almost as large as wild-cherries, and of a sweetish taste. It is common in many parts of the s. of Europe, and in the s. of England in woods and hedges. The English name is derived from the use made of the plant by butchers, to sweep their blocks. It grows well under trees or shrubs, and can often be advantageously introduced for ornamental purposes. The root was formerly much used in medicine. It is aperient and diuretic.—*R. hypophyllum*, a native of Italy, had once a considerable reputation as a stimulant of the uterus.

BUTE, an island in the firth of Clyde, Scotland, separated from the coast of Argyle by a narrow winding strait, called the kyles of Bute, mostly under a mile wide, about 6 m. distant from the w. coast of Ayrshire, and 8 m. n. of Arran. It is about 16 m. long, of irregular breadth, and with an area of 60 sq. miles. The surface to the n. is high, rugged, and barren; in the center and s., it is low and undulating, and comparatively fertile. The highest point rises 875 feet. The coast is rocky and has some bays. The island has several small lakes. The climate is milder than in any other part of Scotland, and, though moist, less so than on the w. coast generally; hence, it is much resorted to by invalids. In the s. the soil is sandy; towards the n. clay predominates. Most of the arable land is under tillage, and agriculture is in a good state. The chief crops are oats, turnips, and potatoes. Pop. '71, 10,064. The principal town is Rothesay. Most of the island belongs to the marquis of Bute, whose beautiful seat, Mount Stuart, is about 4 m. s. from Rothesay. Among the antiquities of B. are Rothesay castle, Kames castle, Kilmorie castle, St. Blaine's chapel, Dungyle, a remarkable vitrified fort on a high crag on the s.w. coast, and the Devil's caldron, a circular erection, the original purpose of which is not well known. B. and the neighboring isles were for many centuries subject to the Norwegians.

BUTESHIRE, a county in the s.w. of Scotland, comprising the isles of Bute (q. v.) and Arran (q. v.), and the Cumbræes, Holy isle, Pladda, Inchmarnoch, and other smaller islands. The area of the whole, according to the ordnance survey, is 225 sq. m., or 143,977 statute acres. The pop. in 1871 was 16,977. B. returns one member to parliament. The county town is Rothesay, in the island of Bute.

BUTE, JOHN PATRICK CRICHTON STUART, third marquis, and reputed hero of Disaster's *Lothair*. He joined the Roman Catholic church in 1868, and took great interest in furthering religious education, in pursuance of which he, among other enterprises, purchased land, and established near Jerusalem an asylum for pilgrims.

BUTE, JOHN STUART, third earl of, was b. in 1713, and d. in 1792. About 1737, he attracted the favorable notice of Frederick, prince of Wales, who made him one of his lords of the bedchamber. After the death of the prince, he became groom of the stole to his son, afterwards George III., over whose mind he obtained a strong influence. In Mar., 1761, he was appointed one of the principal secretaries of state; and from the 29th May, 1762, to the 8th April, 1763, he was prime minister. His government is memorable only as one of the most unpopular that ever held office in Britain, its fundamental principle being the supremacy of the royal prerogative, of which the executive government were merely the humble servants. Lord Bute was given to scientific pursuits, especially botany, and showed himself a liberal patron of literature and art. He married the only daughter of lady Mary Wortley Montagu.

BUTEA, a genus of plants of the natural order *leguminosæ*, suborder *papilionaceæ*, remarkable for the great length of the standard of the flower, and having a compressed, one-seeded pod, membranaceous at the apex. The best known species are *B. frondosa* and *B. superba*, natives of India; and the former very widely diffused throughout that country, generally appearing as a sort of shrub in the neighborhood of villages, but in the jungles growing into a small tree. These trees present a gorgeous sight when covered with racemes of large deep scarlet flowers. They have trifoliate leaves, with roundish leaflets, velvety beneath. They yield a resinous exudation, which occurs in the form of lurid red tears, often covering the twigs, and is one of the kinds of lac (q. v.) brought to the market in India. The juice of the tree is not red, and the lac is supposed to be elaborated by insects, but of what species is unknown. *B. frondosa* is called the *dhak* tree in India. The bark and roots are very fibrous, and the fiber is used for calking boats. The flowers, called *teesoo* or *keesoo*, yield a beautiful yellow or orange dye.

BUTERA, a t. of Sicily, in the province of Caltanissetta, and 8 m. n.n.w. from Terranova. It stands on a height on the left bank of the Manfria. Ruins of great antiquity exist in the neighborhood, but the ancient name is unknown. In 853, B. was besieged for five months by the Saracens, who raised the siege on the surrender of 6000 persons as slaves. B. was almost the last town in Sicily taken by the Normans, having

held out against count Roger till 1089. The present castle is of Norman erection, and contains a number of medæval antiquities. Pop. 5150.

BUTLER, a co. in s. Alabama; 875 sq. m.; pop. '70, 14,981—6391 colored; hilly, and mostly covered with pine woods; produces corn, cotton, etc. The Mobile and Montgomery railroad passes through. Co. seat, Greenville.

BUTLER, a co. in n.e. Iowa, on Cedar river and the Dubuque and Sioux City railroad; 576 sq. m.; pop. '75, 11,734; an agricultural region, mostly prairie. Co. seat, Butler Centre.

BUTLER, a co. in s. Kansas, on the White and Walnut rivers; 1519 sq. m.; pop. '78, 14,175. Agriculture is the chief business. Co. seat, El Dorado.

BUTLER, a co. in s.w. Kentucky, on Green river; 500 sq. m.; pop. '70, 9404—643 colored. Surface uneven, with moderately fertile soil; agriculture the main business. Co. seat, Morgantown.

BUTLER, a co. in s.e. Missouri, on the Arkansas border, w. of St. Francis river; 560 sq. m.; pop. '70, 4298—21 colored. It has a level surface and fruitful soil, producing corn, tobacco, etc. Co. seat, Poplar Bluff.

BUTLER, a co. in e. Nebraska, s. of Platte river; 576 sq. m.; pop. '76, 4730; in '80, 9052; productions agricultural. Co. seat, David city.

BUTLER, a co. in s.w. Ohio, on the Indiana border, intersected by Miami river, the Miami canal, and three railroads; 455 sq. m.; pop. '70, 39,912. Productions agricultural. Co. seat, Hamilton. There are in the co. many interesting monuments of aboriginal inhabitants.

BUTLER, a co. in w. Pennsylvania, near the Alleghany river, drained by the waters of the Beaver; 800 sq. m.; pop. '70, 36,510. The surface is diversified, and the soil sandy but tolerably good, producing the usual crops. Coal, iron, and limestone are plentiful. Co. seat, Butler.

BUTLER, ALBAN; an English hagiologist, 1710—73. He was educated at the Douay Roman Catholic college, where he was professor of philosophy, and afterwards of divinity. He traveled on the continent, was chaplain to the duke of Norfolk, and president of the English college at St. Omer's, where he died. The *Lives of the Saints* was his great work. It has passed through many editions.

BUTLER, ANDREW PICKENS, 1796—1857; a graduate of South Carolina college, and lawyer of South Carolina. He was in the legislature in 1824, and in 1833 was appointed judge of sessions and afterwards of the supreme court. In 1846, he was chosen U. S. senator. It was Mr. Sumner's reply to B.'s last speech in the senate that led to the assault upon the Massachusetts senator by Preston S. Brooks.

BUTLER, BENJAMIN FRANKLIN, 1795—1858; a native of New York, and law partner of Martin Van Buren. He served in the legislature, and was a member of the commission to revise the statutes. In Jackson's cabinet he was attorney-general, 1831—34, and acting secretary of war, 1836—67. He was afterwards professor of law in the university of New York. He was a leading member of the Democratic party up to the time of the passage of the Kansas-Nebraska bill, after which he acted with the other party.

BUTLER, BENJAMIN FRANKLIN, general of volunteers, U. S. army, was b. at Deerfield, N. H., Nov. 5, 1818. He graduated at Waterville college, Maine, in 1838, studied law at Lowell, Mass., where he was admitted to the bar in 1841, and became distinguished as a criminal lawyer and Democratic politician. He was a member of the state legislature in 1853, of the state senate in 1859—60, and a delegate to the Democratic national conventions at Charleston and Baltimore in 1860, where he supported the nomination of Jefferson Davis and John C. Breckenridge, and was nominated as the Democratic candidate for governor of Massachusetts. B. had risen to the rank of brig. gen. of militia; and at the outbreak of the war of secession, April 17, 1861, he marched with the 8th Massachusetts brigade, and after a check at Great Bethel, was appointed to the command of Baltimore, and subsequently of eastern Virginia, with his head-quarters at fortress Monroe. In Feb., 1862, he commanded the military forces sent from Boston to Ship island, near the mouth of the Mississippi; and after New Orleans had surrendered to the naval forces under commander Farragut, he held military possession of the city, and by his severity, and especially by an, at least apparently, atrocious order respecting the treatment of women, brought upon himself the intense detestation of the southern people, and a very general feeling of reprobation. Relieved of his command, he returned to fortress Monroe, acted under gen. Grant in his operations against Petersburg and Richmond, and, June 13, 1865, by his refusal to co-operate with the naval forces, caused the failure of the first attempt to take fort Fisher, the chief defense of Wilmington. Returning to Massachusetts at the end of the war, he took an active part in politics as an extreme radical, advocated the impeachment of president Johnson; in 1866, he was elected member of the house of representatives, and has been repeatedly elected until 1878.

BUTLER, BENJAMIN FRANKLIN (*ante*), b. N. H., 1818; a graduate of Waterville (Me.) college; admitted to the bar in Massachusetts, and acquired a large practice in Lowell and other cities. He was early in politics as a member of the Democratic party, and by them was chosen to the legislature in 1853. In the same year he was a member of the constitutional convention, and in 1859 was elected to the state senate. On the first call for troops in the secession conflict (April 15, 1861), B., who was a brig.gen. of militia, called out his brigade. On the next day, the 6th regiment left Boston; and on the 18th, B. at the head of the 8th regiment started for Washington by way of Baltimore. Two regiments of his brigade had in the mean time sailed for fortress Monroe, of which they took possession. The burning of railroad bridges prevented B. from reaching Washington directly, and he took possession of Annapolis and repaired the railroad from that city to Washington so speedily, that the 7th New York and the 8th Massachusetts regiments reached the capital in season to prevent any attempt at seizure. In May, he took possession of Baltimore without opposition, and the same month was appointed maj.gen. and given command of fortress Monroe. Here he made the declaration, when requested to return runaway negroes, that the slaves were "contraband of war"—a doctrine that greatly discouraged the secessionists and correspondingly elated the union side, for up to that period there had been no hesitation on the part of the civil or military authorities in doing their utmost to arrest and return fugitive slaves. In the spring of 1862, he commanded the land force of 18,000 men designed to co-operate with Farragut in command of the fleet to operate in the lower Mississippi, and on the 1st of May he took possession of New Orleans, where he remained until relieved by gen. Banks in December. His administration in New Orleans was violently denounced: but he kept order; forced the people to keep reasonably clean streets and so avoided the yellow-fever for one season; compelled the rich secessionists to contribute to the support of those whom their rebellion had reduced to want; and enforced due respect for the flag of the nation. Near the close of 1863, he was put in command of the department of Virginia and North Carolina, and in May, 1864, occupied City Point and Bermuda Hundred in support of Grant's movement upon Petersburg. In October he was sent to New York to assure peace during the election, there being danger of serious trouble. In 1864, he was sent against fort Fisher, but the enterprise failed, in consequence of a storm, and he returned, contrary to orders, for which he was relieved from command. In 1866, he was chosen member of congress from the Boston district, and in 1868, was one of the managers in the impeachment of president Johnson. From the breaking out of the rebellion until 1876-77, Butler acted with the Republican party; but when the greenback and labor movement began to take shape he favored it, and in 1878 was the candidate of those parties, and of a large portion of the Democratic party, for governor of Massachusetts, receiving 109,435 votes to 134,725 for the successful Republican candidate. He was again a candidate of "greenbackers," labor men, and Democrats, in 1879, but was again unsuccessful.

BUTLER, CHARLES, 1750-1832; a prolific English writer, nephew of Alban. He was educated at Douay, and entered at Lincoln inn in 1775, coming to the bar in 1791. His literary activity was enormous. Among his works were *Reminiscences*; *Horæ Biblicæ*; *Horæ Juridicæ Subsecivæ*; *Book of the Roman Catholic Church*; and lives of Erasmus, Grotius, and others. He also edited his uncle's *Lives of the Saints*, and completed an edition of *Coke upon Littleton*.

BUTLER CLEMENT M., D.D., b. N. Y., 1810; a Protestant Episcopal minister in Georgetown, D. C., Boston, and Washington; rector of Grace church, Rome, Italy, 1862-64; professor of ecclesiastical history in the divinity school of the Protestant Episcopal church in West Philadelphia. He has published *The Book of Common Prayer Interpreted by its History*; *Old Truths and New Errors*; *St. Paul in Rome*; *Inner Rome*; *Manual of Ecclesiastical History from the 1st to the 18th Century*; *Sermons*, etc.

BUTLER, JOHN, a native of Conn.; d. Canada. 1794; a tory leader in the revolution, commanding a regiment of militia. In 1776, he organized a band of guerillas disguised as Indians, who committed many outrages. He also commanded the men who destroyed Wyoming, Penn., in 1778. After peace he settled in Canada, where he was agent for Indian affairs.

BUTLER, JOSEPH, one of the most eminent of English divines, was b. in 1692 at Wantage, in Berkshire, where his father kept a shop. With a view to the ministry of the Presbyterian church, he attended a dissenting academy at Tewkesbury, in Gloucestershire. At the age of 22, he gave proof of high metaphysical ability in a letter to Dr. Samuel Clarke, usually appended to that celebrated writer's *a-priori* demonstration, to which it offers some objections. About this time, he made up his mind to join the church of England, and in Mar., 1714, entered Oriel college, Oxford. Soon after, he took orders. In 1718, he was appointed preacher at the Rolls chapel, where he preached those remarkable sermons which he published in 1726. The first three, *On Human Nature*, constitute one of the most important contributions ever made to moral science. The scope of the reasoning is briefly, that virtue is consonant with, and vice a violation of, man's nature. In 1725, B. was presented to the rich benefice of Stanhope, in the co. of Durham, to which he removed in the following year. Here he resided in great retirement till 1733. His friend Secker, the archbishop, desired to see him pro-

moted to some more important position, and mentioned his name once to queen Caroline. The queen thought he had been dead, and asked archbishop Blackburne if it were not so. "No, madam," said the archbishop; "but he is buried." In 1733, B. became chaplain to his friend lord chancellor Talbot, and at the same time a prebendary of Rochester. In 1736, he published the great work of which the germs were contained in his three sermons, and which has entitled him, in the eyes of his eloquent disciple Chalmers, to be called "the Bacon of theology." The leading aim of the *Analogy* is to show, that all the objections to revealed religion are equally applicable to the whole constitution of nature, and that the general analogy between the principles of divine government, as revealed in the Scriptures, and those manifested in the course of nature, warrants the conclusion that they have one Author. Soon after the publication of this work, B. was appointed clerk of the closet to the queen, who greatly prized his conversation. In 1738, he was made bishop of Bristol; in 1740, dean of St. Paul's; and in 1750, he was translated to the see of Durham. He lived only to make one visitation of his diocese. His "charge" on the occasion, in which he pointed out, with characteristic depth of insight, the importance of a due maintenance of the externals of religion, as a means of keeping alive the thought of it in the minds of the people, subjected him to much censure as betraying a tendency to Roman Catholicism—a charge unworthy now of serious notice. B.'s private character was such as became a Christian prelate: grave and judicious, he was at the same time meek and generous. His intercourse with his clergy and people was frank and humane; his episcopal treasures were wisely and munificently distributed, as not his own; and no anxious legatee looked with hope to his death. That event took place at Bath, June 16, 1752, and the good bishop's remains were buried in Bristol cathedral. His works, notwithstanding a dry and uninteresting style, have gone through numerous editions. The best is that edited, with a life, etc., by Fitzgerald.

BUTLER, SAMUEL, poet, was b. at Strensham, Worcestershire, in 1612. His father was a farmer in that place, and said to be a person of some education. Young B., after acquiring the rudiments of his education at home, was placed at the college school at Worcester. His progress there was rapid, and on leaving it he proceeded to one of the universities. After finishing his education, he was appointed clerk to T. Jeffreys, esq., justice of the peace, and in his leisure hours devoted himself to the study of music and poetry. He afterwards entered the household of the countess of Kent, which he left, and went to live with sir Samuel Luke, who resided in the same county. After the king's restoration, he was made secretary to the earl of Carberry, which office he held till 1661. About this time, B. married a Mrs. Herbert, a lady of good family and some property, which, however, was afterwards lost by being invested in bad securities. He published the first part of *Hudibras* in 1663, and its reception at court was immediate and triumphant. It received all the favor Charles could spare from his spaniels and his mistresses, and he deigned even to garnish his royal conversation with its wit. The courtiers took up the fashion, the coffee-houses and taverns followed suit, and finally the mob went into raptures, in imitation of its betters. *Hudibras* was pirated within four weeks of its publication. The king had wit enough to see the merit of the work, but he lacked generosity to relieve the necessities of the writer. There seems to be no good reason to believe that B.'s palm ever tingled to the touch of royal pension or gratuity. Poverty is almost the only thing in B.'s life that one is certain of. In 1664, he published the second part of his book, and a third part appeared in 1678. He died in Rose street, Covent garden, in 1680; and while some say that he starved from pride, all agree that at his death he was very poor.

Hudibras is a kind of metrical *Don Quixote*; and if the work of Cervantes stands at the head of its class in the literature of Spain, *Hudibras* occupies the same place in the literature of England. The Puritans are the subjects of B.'s derision, and king Charles must have felt that the poet avenged for him the battle of Worcester. The weight, compression, and plenteousness of the wit is wonderful. *Hudibras* is like a mass of crystals, every point flashes. It is, beyond any other book, of wit "all compact." B. thinks in witty couplets, he argues in them, he spears his foes with a jest, he routs and chases them into oblivion with unextinguishable laughter. His best things have become proverbs. His mass of wit has been grated down into common speech, and particles of it may be found any day glittering in the talk of English plowmen and artisans.

BUTLER, WILLIAM ALLEN, LL.D.; b. N. Y., 1825; a graduate of the university of New York, studied law with his father (Benjamin F. of New York), and traveled extensively abroad before commencing practice. He is the author of several popular satirical poems, among which are *Nothing to Wear*; *Barnum's Parnassus*; and *Two Millions*. He has also published *Lavoyer and Client*, and a biographical sketch of Martin Van Buren.

BUTLER, WILLIAM ARCHER, a religious and philosophical writer of singularly high promise, was born in 1814, at Annerville, near Clonmel, Ireland. He was originally a Roman Catholic, but subsequently became a Protestant, and studied at Trinity college, Dublin, where he was appointed professor of moral philosophy in 1837. He died in 1848. The principal work on which his reputation is based, is the *Lectures on the History of Ancient Philosophy*, edited with notes by W. Hepworth Thomson (Cambridge, 1856, 2

vols.). These lectures are remarkable for their great learning, eloquence, and depth of judgment. Besides his lectures, there have appeared, *Sermons*, with a memoir by the Rev. Thomas Woodward (Dublin, 1849); *Letters on the Development of Christian Doctrine* (Dublin, 1850); *Letters on Romanism* (Lond. 1854).

BUTLER, WILLIAM ORLANDO, 1793-1880; b. Ky.; served in the Indian battles of 1812, and under Jackson at New Orleans, and after the war practiced law in Kentucky. He was a member of congress, 1839-43, and next year democratic candidate for governor; in 1848 the democratic nominee for vice-president, but not successful. He served as maj. gen. of volunteers in the war with Mexico, and was wounded at Monterey. He was a member of the peace congress of 1861.

BUTLERAGE OF WINE, as described by Blackstone and Stephen, is a very ancient hereditary duty belonging to the crown, and is, otherwise called the *prisage* of wines. This duty is taken notice of in the great roll of the exchequer, 8 Richard I., still extant. Under the right to levy it, the crown could take two tuns of wine from every ship (English or foreign) importing into England 20 tuns or more, one before and one behind the mast; which, by charter of Edward I., was exchanged into a duty of two shillings for every tun imported by merchant strangers, and called butlerage, because paid to the king's butler.

BUTO, an Egyptian goddess, deity of the town Buto in northern Egypt. She personified lower Egypt; and, it was believed, presided over fire, and resided in the sun. B. was considered to represent the Greek Latona, and to be the regent of certain districts and cities in Egypt and Arabia.

BUTOMUS, a genus of aquatic plants, of which one species, *B. umbellatus*, is frequent in ditches and ponds in England, Ireland, and many parts of Europe, but is very rare in Scotland. It is popularly called flowering rush, and is one of the plants to which the praise has been assigned of being the most beautiful in the British flora. The leaves are all radical, 2 to 3 ft. long, linear, triangular, their sharp edges sometimes cutting the mouths of cattle, whence the generic name (Gr. *ox-cutting*). The scape, or flowering stem, is longer than the leaves, terminating in a large umbel of rose-colored flowers, readily distinguished from those of all other British plants by having nine stamens, six in an outer, and three in an inner row.

BUTT, ISAAC, b. 1813; graduate of Trinity college, Dublin, and a member of the Irish bar. He was one of the counsel for Smith O'Brien and others tried in 1848 for treason, and also for the Fenians tried in 1865. In 1852, he was chosen to parliament from Younghall as a liberal conservative; and in 1871 he was returned from Limerick as a "home ruler," and has been to the present time the chief leader and support of the idea which that name involves. He was one of the projectors, and for a time the editor, of the *Dublin University Magazine*. He has also published *Literature of Political Economy*; *History of the Kingdom of Italy*, and works on the relations of landlord and tenant.

BUTTE, a small hill or knoll, or rising ground; in some places applied to mountains, as the Downieville Buttes in California, which are nearly 9000 ft. high.

BUTTE, a co. in n. California, on the Sacramento and Feather rivers; 1458 sq. m.; pop. '70, 11,403. The surface is rough and well wooded, and the soil fertile. The co. is rich in gold, silver, platinum, cinnabar, lead, and iron. The Marysville branch of the Pacific railroad crosses the w. portion. Wheat, barley, wine, and wool are the chief agricultural productions. Co. seat, Oroville.

BUTTER (Ger. *butter*; Fr. *beurre*; Lat. *butyrum*) is the fatty substance present in the milk of the mammalia, and capable of being extracted from it. In ancient times the Hebrews seem to have made copious use of butter as food; but the Greeks and the Romans used it only as an ointment in their baths, and it is probable that the Greeks obtained their knowledge of the substance from the Scythians, Thracians, and Phrygians, whilst the Romans obtained it from Germany. In southern Europe, at the present time, B. is very sparingly used; and in Italy, Spain, Portugal, and southern France, it is sold by apothecaries as a medicinal agent for external application. The amount of B. in cows' milk (q. v.) is about 4 per cent, though the kind of pasture, quantity of milk, and general condition, influence the relative quantity of the several ingredients of milk. In the extraction of B., the milk is allowed to cool, and the cream which rises to the surface is skimmed off, and put into a large, deep, earthenware vessel, where it lies for several days till enough has been collected for a *churning*. Any difference in the exact mode of treatment of the milk yields a B. with some peculiarity or other. Thus, the B. and cream of Devonshire, which are famed for their superior richness, owe this in greater part to the mode of manipulating the milk, and not to the special character of that fluid, or to the richness of the pastures in those districts. The milk in Devonshire is not allowed to cool slowly, as elsewhere, but is at once placed in large deep pans, and carefully heated. A scum quickly rises, which is pushed to the side; and whenever the bubbles of steam appear, the milk is removed, and allowed to cool in the ordinary way, when a good deal of the milk thickens to the consistence of B., and is skimmed off as the celebrated *Devonshire clouted cream*. In England, the B. of Epping and Cambridge is highly esteemed, and in every part of Great Britain, the Dutch B., in a salted form,

is very largely consumed; indeed, three fourths of all the foreign B. consumed in Great Britain is imported from Holland.

In order to separate B. from milk, recourse is always had to the process of agitation in churns (q.v.). The principle involved in each and all forms of this apparatus is the thorough agitation of the contents, so as to cause the rupture of the minute fat globules present in the milk, and the incorporation of these ruptured fat globules into larger or smaller masses of butter. The cream is strained through cloth into the churn, to remove any foreign matter; and the agitators being set in motion, the friction of the movement, combined with the admission of air, and the chemical changes it induces, raises the temperature of the whole contents. At one time, it was thought that one great object of the agitation was the admission of the oxygen of the air, which becoming thoroughly incorporated with constituents of the milk, combined therewith, and, as a consequence, led to the separation of the butter. It is found, however, that B. can be obtained from milk by mere agitation, without the admission of the oxygen of the air. At the same time, in the ordinary way of churning, oxygen does play a subordinate part by combining with the sugar of the milk, and forming lactic acid, which in its turn *sours* the milk, and separates therefrom the caseine (q.v.)—cheese-matter—in minute clots or flakes, yielding what is commonly called *sour* or *butter milk*. The process of churning must be conducted at a medium rate. If too quickly performed the B. is soft and frothy, and is said to *burst*; whilst when too slowly made, it is highly tenacious, strong tasted, and badly flavored. When all the B. has *come*, which is known by the particles agglutinating into irregular masses, the B. is *made* by taking the lumps, and well washing and kneading them on a wooden board in a tub of pure spring-water till all the butter-milk has been expressed; it is then divided into the requisite size of lumps, fashioned into rolls, or molded into forms, and usually stamped with some device. In the making up of the B. the hands of the operator must be scrupulously clean, and be free from the slightest taint of soap. Persons who are subject to moist hands should never knead B., as it is very liable to be contaminated by the slightest foreign matter, especially animal secretions; and it is better always for the operator to wash the hands with water containing some oatmeal before commencing. So important is this source of contamination regarded in America, that every endeavor is made to get quit of manual labor in working the B., and a wooden *butter-walker* has been invented, and is largely used there. When newly prepared, the B. is called *fresh* or *sweet* B., and is of a yellow color, which is well known to be deeper as the pasture on which the cows have been fed is richer, and hence the poorer kinds of B. are often artificially colored with annatto (q.v.).

A large quantity of the B. sent into market has more or less common salt added, for the purpose of preserving it. For use within a week or two, the proportion of common salt employed is about $\frac{1}{4}$ an oz. to 2 lbs. of B., though, where it has to be kept for some time, as much as 1 oz. of salt to 1 lb. of butter is used. The incorporation requires to be carefully and dexterously done, so that the resulting material may be uniform; and the better plan is to add only a portion of the salt at a time, and to knead and re-knead the B. till the whole is thoroughly mixed. When the less amount of salt has been employed, the result is *powdered* B., and the larger quantity yields *salt* butter. Much of the latter is closely packed in small wooden firkins or *kits*, and occasionally in stoneware, and sent into market. Great care must be taken to have these kits, and indeed to have every vessel used in the preparation, as clean or *sweet* as possible. Constant rinsings with cold water, and scaldings with boiling water, are resorted to. Attention must likewise be paid to the air of the apartments in which the operations are carried on, as a tainted air is very injurious.

The adulterations liable to be present in B. are an undue proportion of salt and water, and these run up occasionally to upwards of 33 per cent, or one third of the total weight. Another adulteration is the presence of lactate of zinc, derived from the milk being placed in zinc pails and basins, from the impression that by some imaginary electrical influence an increase in the amount of cream will be the result; but though this is not attained, yet the milk tending to form lactic acid, the latter attacks the zinc vessel, and forms lactate of zinc, which dissolves in the milk, and thereby contaminates it, imparting an unpleasant taste, and, when present in larger quantity, leading to violent spasmodic vomiting. When B. is allowed to get old, it becomes rancid and tastes and smells disagreeably. To some extent an acid is formed, called butyric acid (q.v.). For the use of B. in diet, see FOOD and NUTRITION.

BUTTER, in chemistry, is often applied generically to any substance of the same consistence of B., and is therefore used to designate palm, cocoa-nut, shea, and nutmeg oils. It is also applied to certain metallic substances which have an oily aspect and consistence resembling melted B.; thus we have B. of antimony, bismuth, zinc, and tin.—BUTTER of antimony is a thick, dense, oily compound, produced by acting upon the native sulphuret of antimony (Sb_2S_3) by concentrated hydrochloric acid (HCl) and heat, when the oily chloride of antimony ($SbCl_3$) is formed. See ANTIMONY.

BUTTERINE, a substitute for B., was first manufactured in France, but is now extensively produced in this country. It is composed of animal fat, amalgamated with milk, to which is sometimes added a small proportion of real butter.

BUTTER, Rock, a mineral which may be regarded as a variety of alum (q.v.)—an iron alum, appearing as a pasty exudation from rocks that contain alum or its constituents,

particularly alum-slate and other schistose rocks. It occurs at Hurlet alum-work, near Paisley, Scotland, and in a number of places on the continent of Europe. It is not unlike B. in color, varying from yellowish white to sulphur yellow. It is rather greasy to the touch, and is easily broken in pieces.

BUTTERCUP. See **RANUNCULUS.**

BUTTERFIELD, JOHN, 1783-1869; one of the founders of the express business in the United States. Before the time of railroads he was proprietor of many important lines of stage coaches, especially in New York state.

BUTTERFIELD, WILLIAM, b. 1814; an English architect noted as a leader of the "Gothic revival" in England. His work has been chiefly in church and collegiate architecture.

BUTTERFISH. See **GUNNEL.**

BUTTERFLY, the common English name of all the diurnal lepidopterous (q.v.) insects, corresponding with the genus *papilio*, as originally defined by Linnæus, but forming many genera in the most recent entomological systems. Butterflies exhibit a great similarity in almost all respects to other lepidopterous insects, the common characters of which will be found in the article on that order; but are distinguished even more than the rest of them generally, by brilliancy of coloring, which in butterflies also belongs to the under as well as the upper side of the wings, whilst the beauty of moths and hawk-moths appears chiefly on the upper side. Accordant with this circumstance, is the further peculiarity, that almost all butterflies, when at rest, usually hold their wings erect, the under side being thus chiefly exhibited; whilst the other lepidopterous insects, when at rest, hold their wings in a horizontal or somewhat inclined position, and some have them wrapped round the body. Butterflies are also the only lepidopterous insects which have no spines, bristles, or hooks on the margins of their wings, by which the second wing on each side can be attached to the first, but both when flying and at rest, have all their wings quite separate. The manner in which the scales of the wings are imbricated, gives those of butterflies a smoother appearance than those of moths and hawk-moths. The antennæ of butterflies are generally simple, slender, and elongated, and terminated by a little club. Their caterpillars have always sixteen feet (see **CATERPILLAR**). The pupa or chrysalis is angular; is seldom enveloped in a cocoon; is generally suspended by the tail, by means of a silky substance, often to a leaf or twig, but is sometimes supported by bands around the middle; and generally exhibits more or less of that golden coloring from which both the names *aurelia* (Lat. *aurum*) and *chrysalis* (Gr. *chrysos*) are derived.

Butterflies are found in all parts of the world; they are to be seen during the sunshine of the brief summer extracting nectar from the flowers even of Greenland and Spitzbergen, but they are most numerous in the warmest regions; where, however, many of them live chiefly in the shade of moist foliage, in woods and jungles. Dr. Hooker, describing the scenery on the banks of the Great Runjeet in the Sikkin Himalaya, says that "by far the most striking feature consisted in the amazing quantity of superb butterflies, large tropical swallow-tails, black, with scarlet or yellow eyes on their wings. They were seen everywhere, sailing majestically through the still hot air, or fluttering from one scorching rock to another, and especially loving to settle on the damp sand of the river edge, where they sat by thousands, with erect wings, balancing themselves with a rocking motion, as their heavy sails inclined them to one side or the other, resembling a crowded fleet of yachts on a calm day."

Butterflies possess no small power of wing; some of them, indeed, of which the wings are comparatively thin and delicate, are inferior in this respect, and have a sort of zigzag flight; but others soar in the air with a steady and continuous motion. Short-lived as they are all generally believed to be, some of the tropical species perform wonderful migrations; concerning which, however, nothing but the fact is yet well known. "Frequently," says sir James Emerson Tennent in his work on *Ceylon*, "the extraordinary sight presents itself of flights of these delicate creatures, generally of a white or pale yellow hue, apparently miles in breadth, and of such prodigious extension as to occupy hours and even days uninterruptedly in their passage, whence coming no one knows, whither going no one can tell."

The number of species of B. is very great, and the arrangement of them has been found difficult, chiefly upon account of the great similarity in all important respects which prevails among them all. They are divided, however, into two well-marked sections, of which the first is characterized by having only a single pair of spurs or spines on the *tibiæ* (or fourth joints of the legs), placed at their lower extremity; whilst in the other section, the *tibiæ* of the hinder legs have two pair of spurs, one pair at each extremity. This distinction, seemingly unimportant in itself, is accompanied by other differences. The second section of butterflies may be regarded as forming a sort of connecting link between butterflies and hawk-moths. A few British species belong to it, but the species are generally tropical, and some of them, found in tropical America, are remarkable for their rapidity and power of flight, and for the migrations which they perform, besides being amongst "the most splendid insects in creation," a resplendent green, inimitable by art, relieving the velvet black of their wings, and varying with

every change of light. The beautiful iridescence of the wings of these and many other butterflies is owing to the peculiar position of the scales.

Some groups of butterflies are remarkable for the imperfect development of the first pair of legs, so that they are generally described as having four legs instead of six.

The eggs of butterflies are deposited on the plants, the leaves of which are to supply the food of the caterpillars. In cold and temperate climates, the eggs deposited in autumn are not hatched till the following spring; but it is believed that many species produce several broods in a year, as the eggs in summer may be hatched in a few days. The caterpillars of each species are generally confined to some particular kind of plant, the leaves of which they devour; their ravages are well known, but the excessive increase of their numbers is in part restrained by many enemies, and by none more than by the ichneumons (q. v.) and other insects, which deposit their eggs in them, and the larvæ of which feed on them. An account of B. transformations will be given under INSECT TRANSFORMATIONS.

Butterflies vary in size from less than an inch to almost a foot across the expanded wings. The largest species are tropical. Some of the species are very widely distributed: *Cynthia cardui*, of which the caterpillar feeds on the leaves of thistles, is found not only throughout Europe, but in Egypt, Barbary, Senegal, Cape Colony, Madagascar, China, Java, Australia, Brazil, and North America, being, in fact, one of the most widely distributed of all insects. The geographical limits of other species appear to be very restricted. The diversity of coloring is almost endless, but a prevalence of certain hues, or of certain modes of the disposal of them, is observable throughout large groups. The caterpillars of many species are variously furnished with spines, those of others—none of them British—have long fleshy prominences, horny at the tip, probably intended as means of defense. The hinder wings of many butterflies are curiously prolonged into tail-like appendages, one or more on each wing, which vary in form, being sometimes long and linear, sometimes broad, and widening towards the extremity. These are, however, little seen in British species.

Butterflies are chiefly known to us as objects of admiration and of pleasing contemplation, enhancing the charms of the most delightful weather, and always associated with the most lovely scenes, or—it must be added—as a cause or annoyance and vexation by the ravages of their caterpillar young in our fields and gardens. There is, however, one small species (*euplaea humata*) which affords a supply of food to some of the wretched aborigines of Australia. Butterflies of this species congregate in such vast numbers on the masses of granite in the mountains, that they are collected by simply making smothered fires under the rocks, in the smoke of which they are suffocated. Bushels of them are thus procured, and they are baked by placing them on the heated ground, the down and wings removed, and the bodies made into cakes which resemble lumps of fat. The months of Nov., Dec., and Jan. are quite a season of festivity from the abundance of this food.

Brief notices of a few of the principal kinds of B. will be found in other parts of this work. See CABBAGE BUTTERFLY, CAMBERWELL BEAUTY, PURPLE EMPEROR, etc.

BUTTERFLY FISH. See BLENNY.

BUTTERFLY WEED, or PLEURISY ROOT, *Asclepias tuberosa*, see ASCLEPIAS; a plant found in all parts of the United States, and which has obtained a considerable reputation for the medicinal virtues of its root. The root is large, formed of irregular tubers or spindle-shaped branches, externally yellowish brown, internally white, with a somewhat acrid nauseous taste when recent, merely bitter when dried. It yields its properties to boiling water, and is usually administered in the form of a decoction, sometimes in that of a powder. It is diaphoretic and expectorant, and has been found useful in the commencement of pulmonary affections, in rheumatism, and in dysentery.—The stem of the plant is erect and hairy, with spreading branches; the leaves oblongo-lanceolate, alternate, hairy, and somewhat crowded; the flowers orange-yellow, forming numerous umbels.

BUTTERMILK is the form of milk from which the butter or oily matter has been abstracted. See BUTTER. B. contains the caseine, sugar, and salts of ordinary milk, and is only deficient in oily matters. It is therefore nutritious, and is largely used in Ireland and Scotland as an article of food, being very generally partaken of with porridge and with potatoes. It may be drunk *ad libitum*, is a very agreeable, cooling beverage, and is therefore useful in certain febrile and inflammatory conditions.

BUTTERMILK FALLS, in Le Roy, Genesee co., N. Y., on Oatka creek, which falls over a limestone ledge 90 ft. high. The same name is given to a cascade in Bog Meadow creek, near West Point, N. Y.

BUTTERNUT, or WHITE WALNUT, *Juglans cinerea*, a large, wide-spreading American tree, with nearly smooth bark, and large leaves. The nuts are well-known, and form agreeable food when dried; when taken green and pickled they are prized for the table. Sugar can be made from the sap, but it is much inferior to that made from maple. The timber is useful for coach and cabinet work, posts, rails, and wooden bowls.

BUTTER TREE, a name given to several tropical trees, of different natural orders, the fruits of which yield concrete fixed oils, having the appearance and used for the pur-

poses of butter. The B. trees of India and Africa belong to the genus *bassia* (q. v.), of the natural order *sapotaceæ*; the B. trees of Guiana and Brazil to the genus *caryocar* (q. v.), of the natural order *rhizophoraceæ*. The oil-palms (q. v.), and the *cocos butyracea* (see COCOA NUT), may also be regarded as B. trees, although not generally receiving that name.

BUTTERWORT, *Pinguicula*, a genus of plants of the natural order *lentibulariaceæ* (q. v.), distinguished by a two-lipped calyx, the upper lip trifid, the lower bifid, a spurred corolla, two-lipped and gaping, the upper lip arched; and a globose germen. The species are small plants with only radical leaves, found in the bogs and marshes of different quarters of the world. Some of them possess much beauty when in flower, particularly *P. grandiflora*, a rare native of the s. of France and of Ireland. The common B. (*P. vulgaris*) is abundant in the northern parts of Britain and of Europe. It has the power of coagulating milk. The Laplanders pour reindeer milk, warm from the animal, upon the leaves of this plant, instantly strain it, and set it aside for two or three days, till it acquires the consistence of cream, and some degree of acidity, when it is with them a favorite article of food. A little of it in this state will produce the same effect on warm reindeer milk which was at first produced by the leaves of the plant. The origin of the English name B. is sometimes referred to the power of coagulating milk, sometimes to the peculiar sliminess of the leaves.

BUTTISHOLZ, a village of Switzerland, in the canton of Lucerne, and 11 m. n. w. from the city of that name. Near to B. is a large mound called the English Barrow, because here are buried 3000 Englishmen, followers of De Coucy, son-in-law of Edward III. of England, who, while devastating the cantons, were defeated and killed by Swiss peasants in 1376.

BUTTMANN, PHILIPP KARL, one of the most distinguished philologists of modern times, was b. at Frankfort-on-the-Main in 1764, and studied at Göttingen under Heyne. He became, in 1789, assistant in the royal library in Berlin, and rose successively to be secretary and librarian (1811). He held at the same time (1800-8) a professorship in the Joachimsthal gymnasium in Berlin, which he afterwards exchanged for a professorship in the newly founded university of that city. He died 21st June, 1829. B. is best known by his Greek grammars, the *Griech. Grammatik* (Berl. 1792; 21st ed. by his son, Alexander Buttmann, 1863), and an abridgment of it, *Griech. Schulgram.* (14th ed. 1862); both have been translated into English. His *Lexilogus* (translated by Fishlake) and *Ausführliche Griech. Sprachlehre*, or larger Greek grammar, which have gone through several editions, are designed for scholars. In his *Mythologus*, he has collected his essays on the myths of the ancients.

BUTTON. The term B. is applied to the well-known appendages to dress used for fastening or for ornament; and to a sort of oblong latch moving upon a pivot in the middle, used by joiners and cabinet-makers for fastening the lids of boxes, doors of presses, etc. The mass of fused metal found at the bottom of a crucible or cupel, after fusing or assaying, is also technically called a button.

The history of button-making is in many ways a curious one. Dating no further back as a trade of any importance than the reign of Elizabeth, it has undergone several extraordinary changes, produced chiefly by the ever-varying fashions in dress, but also by some simple, though ingenious inventions, as well as by foreign competition. In Great Britain, Birmingham has always been the principal seat of the button manufacture. What has been called the "Augustan age" of button-making in that city included the latter portion of last and the early part of the present century, when even tradesmen wore coats "loaded with innumerable gilt buttons," and when employers on a moderate scale in this manufacture were making incomes of from £2000 to £3000 a year, and their workmen from £2 to £4 per week. Early in the present century, Mr. B. Sanders introduced the cloth-covered button, which initiated the change from those made of metal, and by which he rapidly made a fortune. His son, in 1825, effected the apparently trivial but really ingenious improvement of making it with a canvas tuft instead of a metal shank, by which both the button-holes and the garment itself were less subject to injury. This kind of button had an enormous sale, and is still much used. A further alteration was made on it by Mr. W. Elliott, who patented, in 1837, a mode of covering the button with silk, having a pattern in the center, the demand for which was at one time so great, that sixty looms were employed in London in making the special material required for them. In 1841, the old Dorsetshire wire and thread button was replaced by the "three-fold linen button," still considered by housewives indispensable for under-clothing, since neither washing nor mangling destroys it. It is said to be the invention of Mr. H. Jeffries, of Birmingham, but was patented by Mr. J. Aston, and continues to be made in vast numbers. A single English firm recently consumed in one year for this kind of button, 63,000 yards of cloth and 34 tons of metal, upon which 250 hands were employed.

Turning now to other materials which have had a great "success" in their day, we find that buttons made of hoof, under the name of "horn buttons," as introduced nearly 40 years ago by Mons. E. Bassot of Paris, were for a good many years most extensively manufactured at Birmingham, and sent to all parts of the world. In hoof buttons the trade is now comparatively insignificant, and the French makers possess the market for what of it remains. Tweed clothing and fabrics in imitation of it have, through the

necessity of matching their various colors, led to the buttons for them being made of a rather uncommon material, namely, vegetable ivory (q.v.). This substance, which is the fruit of a palm, somewhat resembles true ivory, but is rather softer. It can be readily turned in the lathe, and dyed of various colors. More than twenty tons of it, valued at from £25 to £30 per ton, are weekly consumed in Birmingham in making buttons, and it is also largely used for the same purpose in France and Germany.

What we have hitherto said refers principally to what manufacturers call the revolutions of the trade; but there are other important branches which have been less subject to change, chief among these being the so-called "pearl buttons"—that is, buttons made of mother-of-pearl shells. This has long been a leading branch, and employs a greater number hands than any other. Metal buttons, too, although not relatively so important as formerly, have never ceased to form a prominent section of the trade. They are a numerous class, and include all sorts for uniforms, trouser buttons, fancy buttons which are gilt, stamped, chased, or enameled, and many cheap varieties in iron and other metals for export. Numerous kinds of composite buttons are also partly composed of metal. Glass buttons form another interesting branch, carried on to a considerable extent in Birmingham, but more largely in Bohemia and Paris; so also do porcelain buttons, which, although an English invention, are now almost exclusively made in France. Vulcanite (q.v.) buttons have been extensively made in the United States. As to other materials, a Birmingham manufacturer says it were easy to write out a long list from which buttons have been made, but very difficult to name one from which they have *not* been made.

We shall now describe briefly some of the processes in button-making, beginning with metal buttons. Circular disks, called "blanks," are first cut out of sheet brass or other metal by means of fly-presses, usually worked by girls. The fly-press consists of a vertical iron screw with a triple thread, to which screw is attached a horizontal arm, bending downwards at the end to form a handle. A punch attached to the press rises and falls with the motion of this handle, and rapidly cuts out the blanks. When large quantities of one pattern are required, a self-feeding, self-acting machine is used, which cuts out the blanks in rows at one blow, turning them out at the rate of 2000 gross per day. After being annealed, the blanks are next made convex by a blow from a stamp. The shanks are formed of wire by a separate machine, which cuts off pieces, and bends them into loops of the required form. When these are soldered on, the buttons are dressed on a lathe. They are then gilded and burnished; some, however, are only lackered; and some, though gilt, are finished in a dead or frosted style.—"Shell" buttons are those with a convex face, a flat or convex back, and hollow. These are made of two blanks, that forming the face being larger than the back to which the shank is attached. These blanks are pressed into the required shape by dies worked in the fly-press, and then, by another die, the edge of the larger blank is lapped over the smaller, and thus attached without soldering. Livery and other buttons having a device in strong relief are stamped by a die placed in a stamping-press. See STAMPING OF METALS.

In making covered buttons, a metal blank is punched, and its edge is turned up by a die in a fly-press; then a smaller metal blank is punched with a hole in the middle, and of such size, that, when flat, it shall fit into the upturned edge of the first: this perforated blank, or *collet*, is next pressed into a concave or dished shape. Two cloth blanks—the face one of silk, and the other for the tuft of thin canvas—are now punched, one considerably larger than the front metal blank, the other somewhat smaller; the larger cloth blank is laid upon the flat face of the metal blank, which is filled with a disk of mill-board or paper, and its edges turned over; these edges are covered by the smaller cloth, and then the collet laid upon them with its concavity towards the cloth. They are now all pressed together in a sort of die or mold, by which means the collet is flattened and spread out, while the upturned edge of the metal blank is turned forcibly over it, thus securing the collet, and with it the cloth which is strained tightly on the face, and its edges bound between the blank and the collet, so that the whole is firmly held together. The linen-covered button for underclothing, above referred to, is formed of a single brass ring with a groove or canal on one face. Into this the edges of the two round linen blanks are placed, so that when the edges of the groove are pressed firmly down, the button is entirely covered with linen.

Buttons with holes, technically called "four-holes," "three-holes," and "two-holes," when of pearl-shell, wood, bone, or ivory, are cut with a tubular saw, turned separately in a lathe, and drilled. When of metal, the blanks are punched, then stamped in dies to the required form; the holes are punched, and "rymered," to round the sharp edges that would otherwise cut the thread.—Glass buttons are most largely made by taking a rod of glass of any color, softening the end by heat, and pressing it into a mold, each half of which is fixed to one limb of a pair of pincers. The shank is placed into a hole in the mold before the melted glass is inserted.

According to an estimate published a few years ago by Mr. J. P. Turner of Birmingham, to whose paper we have been much indebted, the number of artisans employed in the button manufactures of that city was then as follows:

Making metal buttons of all kinds.....	1200
“ covered buttons, including linen.....	1500
“ pearl buttons.....	2000
“ vegetable ivory buttons.....	700
“ other kinds, as glass, horn, bone, wood, etc.....	600
Total.....	6000

Probably about 1000 more are employed in London and elsewhere in Great Britain, and a large proportion of the whole are females. At that time, which was before the war with Germany, about 20,000 persons were employed in France, showing how much more largely the button industry has been developed in that country. Germany is a still greater producer, the cheaper kinds of fancy buttons made in the Rhenish provinces of Prussia, the glass buttons of Bohemia, and the pearl buttons of Vienna being more extensively exported than those of any other country. Buttons of various kinds are made on a large scale in the United States, but that country still imports them largely from Europe.

BUTTON, Sir THOMAS, the successor of sir Henry Hudson in the exploration of the n.e. coast of America. In 1612-13, he was frozen in and wintered on the w. coast of Hudson's bay. The next summer he explored all the coasts of the bay, returning to England in the autumn.

BUTTONWOOD. See PLANE.

BUTTRESS (old Eng. *botress*; Fr. *buttée*), a projection for the purpose of giving additional support or strength to a wall. In the classical style, there were no buttresses, their place being, to a certain extent, supplied by pilasters, antæ, etc. The different stages of Gothic architecture are marked by the form of buttresses employed, almost as distinctly as by the form of the arch. The Norman B. was broad, often semicircular, sometimes dying into the wall at the top, and never projecting from it to any great extent. Early English buttresses project much more boldly, and are considerably narrower, than the Norman. They are frequently broken into stages, which diminish in size as they ascend. In the decorated style, this division into stages is almost invariable, the B. being often supplied with niches terminating in pinnacles, and very highly ornamented with carving, statues, etc. In the perpendicular style, they retain the forms which had been introduced during the decorated period, the ornamentation, of course, being varied to suit the character of the style. Flying buttresses—i.e., buttresses in the form of a sloping arch, connecting the upper and central portions of an arched structure with the vertical buttresses of the outer walls—were introduced into England at the period of the early English, though they existed on the continent previously, where they continued to be used to a greater extent. They were also very common in Scotland. In England, they are generally called arch-buttresses.

BUTTS, a co. in central Georgia, on the Ockmulgee; 240 sq. m.; pop. '70, 6941—3435 colored. The surface is uneven, and soil fertile. Productions, corn, cotton, and sweet potatoes. Co. seat, Jackson.

BUTUA ROOT. See CISSAMPELOS.

BUTYRIC ACID may be best obtained by saponifying butter with potash, then adding dilute sulphuric acid till an acid reaction is attained, and distilling about one half of the mixture, adding a little water, and continuing the distillation till the residue is not acid. B. A. may also be obtained by allowing a small quantity of milk-curd to act upon a solution of sugar at a temperature of 77° to 86°, which excites a peculiar process of fermentation resulting in the formation of butyric acid. Some chalk is added to take up the B. A. whenever produced, and the better proportions to employ are 100 sugar, 8 to 10 fresh curd, and 50 chalk, with sufficient water to make a thin liquid. The butyrate of lime is left in the vessel, and on acting upon that by dilute hydrochloric or sulphuric acid, and redistilling, the free B. A. passes over in vapor, and is condensed. B. A. is a transparent, thin, oily liquid, with a most persistent rancid odor. It is mixable in all proportions in water, alcohol, ether, and oil of vitriol; has the specific gravity 973 (water being 1000), boils at 314°; though it volatilizes at ordinary temperatures, as appears from the rancid odor of its vapor. Its chemical symbol is HO, C₄H₇O₂, and it combines with bases, such as lime, soda, etc., to form salts.

BUTYRIC ETHER, or **PINE-APPLE OIL**, is an exceedingly fragrant oil obtained by distilling butyric acid (or the butyrate of lime), alcohol, and sulphuric acid. The material which passes over is the B. E., and it is generally mixed with alcohol, and sold in commerce as *artificial pine-apple oil*. It possesses the same very pleasant flavor which belongs to pine-apples, and there is little doubt that pine-apples owe their flavor to the presence of natural butyric ether. The artificial variety is now extensively used for flavoring confections, as pine-apple drops, for sophisticating bad rum, and for flavoring custards, ices, and creams, as also an acidulated drink or lemonade named pine-apple ale. B. E. alone cannot be used in perfumery for handkerchief use, as, when inhaled in even small quantity, it tends to cause irritation of the air-tubes of the lungs and intense headache, but it is employed as one material in the manufacture of compound perfumes.

It is composed of ordinary ether (C_4H_8O) and butyric acid ($C_4H_7O_2+HO$), and its strict chemical name and symbol is the butyrate of the oxide of ethyl ($C_4H_8O, C_4H_7O_2$). It is remarkable that a substance possessing such a disagreeable odor as butyric acid (that of rancid butter) should be capable of forming, in part at least, a substance with such a pleasant flavor as artificial pine-apple oil.

BUXAR', a t. of Shahabad, in Bahar, presidency of Bengal, situated on the right bank of the Ganges. It is chiefly remarkable as the scene of a victory gained in 1764 by sir Hector Munro. At the head of 7072 men, of whom only 857 were Europeans, he defeated a native army of 40,000, and captured 133 guns. B. is 62 m. n.e. of Benares, and 398 n.w. of Calcutta. Pop. '71, 13,446.

BUXBAUMIA, a genus of mosses, of which only one species is known, *B. aphylla*, a very rare British plant, remarkable for its apparent want of leaves; the whole plant above ground seeming to consist of a little conical bulb, with minute scales, which are, however, really its leaves.

BUXTON, a t. in Derbyshire, 33 m. n.w. of Derby. It lies 900 ft. above the sea, in a deep valley, surrounded by hills and moors, which have been tastefully planted; the only approach being by a narrow ravine, by which the Wye flows into the Derwent. The new part of the town is much under the level of the old. Five m. to the e. of B. is Chee Tor, a perpendicular limestone rock, rising to a height of between 300 and 400 ft. from the Wye. B. has, for 300 years, been famous for its calcareous springs, tepid ($82^\circ F.$), and cold (discharging 120 gallons of water per minute), and its chalybeate springs. It is visited annually, from June to October, by 12,000 to 14,000 persons, the waters being taken for indigestion, gout, rheumatism, and nervous and cutaneous diseases. Nearly 5000 strangers can be accommodated at one time. There is an institution, called the Devonshire hospital, containing 100 beds, supported by subscription, where nearly 1000 patients are annually boarded and lodged free of charge. The baths and public walks are numerous. Much of the splendor of B. is due to the dukes of Devonshire, one of whom, in the last century, at the cost of £120,000, erected an immense three-storied pile of buildings of gritstone, called the Crescent, a curve of 200 ft., with wings of 58 feet. It includes several hotels, a library, assembly rooms, etc. Near B. is the Diamond hill, famous for its crystals; and Poole's hole, a stalactitic cavern 560 yards long. The Romans had baths here. Mary Queen of Scots resided for some time at B., when in the custody of the earl of Shrewsbury. B. is approached by railway both from n. and s.; and the baths, which were rebuilt some years ago, are considered among the finest in Europe. The town, which in 1871 had a population of 3717, is rapidly increasing. Four newspapers are published.

BUXTON, JEDIDIAH, an English prodigy of skill in numbers, b. 1704, and lived about 70 years. Though the son of a schoolmaster and grandson of a vicar, B.'s education was so neglected that he could not write, nor was he at an early period remarkable for knowledge of numbers. He never could tell how his singular power came, or how he used it; but it was observed that when "figuring" his attention was withdrawn from all external objects. He worked out every question by his own methods, without external aid, and without understanding the common rules of arithmetic. He would stride over a piece of land and tell the contents to almost exact measure. In this manner he measured the whole estate of Clinton, some thousands of acres, giving not only the acres but even the square inches. Then for his own amusement, he reduced the whole to square hair-breadths, on the base of 48 hairs to a lineal inch. His memory was such that he could stop in the midst of an abstruse calculation, and a week or even a month later resume it where he had left off. This mania for figures shut him out from all other knowledge, and on returning from church it did not appear that he had brought away a sentence that had been given out. His faculty was tested before the royal society, where he was presented with a gratuity. While in London he was taken to see Richard III., but his only enjoyment was in counting the number of words spoken by Garrick. He would easily count the steps of a company of dancers, but admitted that the sounds given out by a number of musical instruments perplexed him beyond measure.

BUXTON, Sir THOMAS FOWELL, a man of singular earnestness and force of character, belonging to the class termed "philanthropists," was b. in 1786 at Earl's Colne, Essex. The eldest son of a wealthy family, and early deprived of paternal guidance, his youth was distinguished chiefly by a strong development of animal energy, natural enough to a young Englishman whose full stature exceeded 6 ft. 4 inches. At the university of Dublin, his mind at length asserted its claims, and the new consciousness of needing to raise the family fortunes animated him to extraordinary efforts. His preparatory education had been almost thrown away, but at 21 he left the university its most distinguished graduate. In that year he married a sister of the celebrated Mrs. Fry, and entered business as a brewer, with an energy which in due time was crowned with splendid prosperity. His warm religious and moral impulses soon brought him prominently forward as an advocate of philanthropic interests. Prison discipline formed one of the earliest subjects of his efforts. In 1818, he entered parliament as member for Weymouth, which he continued to represent for about 20 years, taking a prominent part in

every debate on such questions as the amelioration of criminal law and of prison discipline, widow-burning and slave emancipation. The latter, in particular, engrossed a large share of his activity for many years, and no man on that side displayed more indomitable zeal and firmness in its advocacy. In 1837, he was rejected by his constituency, and refused ever after to stand for a borough. His philanthropic labors, however, terminated only with his life. In 1840, he received the well-merited distinction of a baronetcy. He died on 19th Feb., 1845. See *Memoirs of Sir T. Powell B.* (1848).

BUXTORF, JOHANN, a celebrated orientalist, was b. 25th Dec., 1564, at Kamen, in Westphalia; studied at Marburg, Herborn, Basel, and Geneva. After traveling through Germany and Switzerland, he settled at Basel, where he became professor of Hebrew in 1591. He died of the plague, 13th Sept., 1629. In a knowledge of rabbinical literature, he surpassed all his contemporaries. The two works which prove his extensive acquaintance with this recondite branch of theological study, are his *Biblia Hebraica Rabbinica* (Basel, 1618-19), and his *Tiberias seu Commentarius Masorethicus* (Basel, 1620). The most useful of his grammatical works is the *Lexicon Hebraicum et Chaldaicum* (Basel, 1607).

BUXTORF, JOHANN, the son of the former, was b. at Basel, 13th Aug., 1599, and displayed at an early period a decided predilection for the same studies with his father. At five years of age—according to his rather credulous biographers—he could read German, Latin, and Hebrew. To perfect his knowledge of these tongues, he visited Holland, France, and Germany; and in 1630 was appointed to succeed his father in the chair of Hebrew at Basel, where he died 16th Aug., 1664. Besides his *Lexicon Chaldaicum et Syriacum* (Basel, 1622), and a work of Maimonides, entitled *More Nevochim* (Basel, 1629), which is an exposition of obscure passages of the Old Testament, he published from the MSS. of his father a *Lexicon Chaldaicum, Talmudicum, et Rabbinicum* (Basel, 1639), and *Concordantiæ Bibliorum Hebraicorum* (Basel, 1632).

BUX'US. See Box.

BUYING OF PLEAS by lawyers is prohibited by an old Scotch act passed in 1594. It is explained under the English term *champarty*, to which it is analogous.

BUYUKDEREH, a beautiful suburb of Constantinople, from which it is a few miles distant, situated on the Bosphorus, in the midst of the most charming scenery. It forms the summer residence of many of the Christian ambassadors, some of whom have splendid mansions here.

BUZZARD, Buteo, a genus of *accipitres* (q.v.), or birds of prey, of the family *falconidae*, having a rather small and weak bill, which bends from the base, and is not notched, as in falcons. The legs are short and strong, the tarsi covered with scales or with feathers, the toes short, and the claws strong. Buzzards may be regarded as an inferior kind of eagles; they do not possess courage equal to that of eagles and falcons, nor equal strength of bill or claws. They are large birds; the common B. (*B. vulgaris*) measuring almost 4 ft. from tip to tip of its outstretched wings. It is a bird still pretty common in Britain, although much less so than it formerly was. It is subject to variations of plumage; the prevailing color is brown, with a considerable mixture of black on the upper parts, and of white or grayish-white on the under. It is sluggish and inactive, in comparison with many other birds of the same family; is usually slow in its flight, and often sits long on a tree, watching for prey, which, when it perceives, it glides silently into the air, and sweeping rapidly down, seizes it in its claws. This B. is plentiful in all the wooded parts of Europe; it is found also in the n. of Africa, and is known to exist in the western parts of Asia; but it is doubtful how far it extends over that continent, a distinct although very similar species occurring in the Himalaya mountains. The common B. is, however, a North American bird. Tame female buzzards have been known in several instances to exhibit so strong a propensity for incubation, and the rearing of young, at the proper season, that they have hatched hens' eggs and brought up the chickens, although if chickens not of their own hatching were brought within their reach, they devoured them. Meat given to the B. nurse was carefully divided among her nurslings, but they found out by their own instincts the use of grain and other vegetable food.—The rough-legged B. (*B. lagopus*) is very similar to the common B., but is at once distinguished by having the tarsi feathered to the toes, whilst in the common B. they are covered with scales. It is a rarer British bird, yet not of unfrequent occurrence; it is very widely diffused, being found in the old world from Lapland to the cape of Good Hope, and equally common in North America. It is most frequently to be seen in marshy districts, and often skimming over marshes, where it makes prey of frogs.—The red-tailed hawk of North America is a species of B. (*buteo borealis*). It is in very bad repute among American farmers and housewives for its frequent invasion of poultry-yards, from which it has acquired the name of *hen-hawk*.—Several other species of B. appear to be limited to particular parts of the world, as *buteo jackal*—so called from the resemblance of its voice to that of the jackal—to s. Africa, and *B. melanosternon* to Australia. The Australian species has the head, chest, and center of the belly deep black. The honey-buzzards (q.v.) belong to a different genus, although nearly allied to the true buzzards, as are also the harriers (q.v.), of which the most common British species, the marsh harrier, is sometimes called the *moor buzzard*.—Bald B. is the name of the osprey (q.v.).

BUZZARD'S BAY, on the s. coast of Massachusetts, about 30 m. long by 7 wide; sheltered from the ocean by the Elizabeth islands and Vineyard sound. In the bay are the harbors of New Bedford, Wareham, Sippican, Fairhaven, and Mattapoiset.

BY-BIDDING, at auctions where the bidder may be employed by the owner, and really bidding to enhance the price, not meaning to purchase. This form is unlawful; but bidding merely to prevent the sale of property below its actual value is not so considered.

BYBLOS, an ancient city of Phenicia, now called Jubeil, situated at the base of the lower range of the Libanus, about half-way between Tripoli and Beyrout. B. was famous as the birthplace of Adonis, or Thammuz, in whose honor a splendid temple was erected, which attracted many worshipers. The name given to the town by the Jews was Giblah, and its inhabitants the Giblites are noticed in the Scriptures as stone-squarers and caulkers of ships. A wall belonging, apparently, to the era of the crusades, surrounds the town, and the remains of a Roman theater are still visible.—B. was also the name of a town in the Egyptian delta, celebrated for its manufacture of papyrus from the byblus or papyrus plant.

BY-LAWS are the private regulations which are usually made by corporate bodies for the control and government of the corporation. They are binding, unless contrary to the laws of the land, or to the charter, or act of incorporation, or, as it has been decided in England, unless they are manifestly unreasonable. Blackstone tells us that the right of making by-laws was allowed by the law of the twelve tables at Rome; and Mr. Stephen, in his *Commentaries*, states that in the law of England such a right is so much of course, as regards every corporation, that if the charter by which certain persons are incorporated give to a select body, out of their whole number, a power to make by-laws as to certain specified matters, the body at large is nevertheless at liberty to make them with regard to all matters not specified. Every corporation, too, can of course alter or repeal the by-laws which itself has made. By the municipal corporation act, 5 and 6 Will. IV. c. 76, s. 90, borough councils have power to make by-laws for the government of the borough, and for the prevention and suppression of nuisances; such by-laws, however, not to be of force till the expiration of forty days after the same, or a copy shall have been sent to one of the secretaries of state, during which period her majesty, with the advice of her privy council, may either disallow the by-laws, or a part, or enlarge the time within which they shall not come into force. Railway companies are required to lay before the board of trade, for the approbation of that authority, certified copies of the by-laws and regulations by which the railway is governed, which by-laws may be disallowed by the board at its pleasure. See CANAL, CARRIER, RAILWAY.

BYLES, MATHER, D.D.; 1706-88; graduated at Harvard, and ordained minister of the Hollis street church, Boston, in 1733. In 1765, he was given the degree of doctor of divinity by the university of Aberdeen. He was a correspondent of Swift and Pope, and published a volume of his own poems. During the revolution he adhered to the English side, and for that reason his connection with his parish was dissolved. In 1777, he was denounced as an enemy to the country, imprisoned for a time, and condemned to exile, but the latter sentence was commuted to confinement in his own house, before which sentinels were placed. His reputation for quick and caustic wit has kept his memory alive.

BYNG, GEORGE, Viscount TORRINGTON, a British admiral, b. Jan. 27, 1663, eldest son of John Byng, esq., of Wrotham, Kent, entered the navy as a volunteer at the age of 15, and rapidly rose to the rank of lieutenant. In 1688, he recommended himself to the prince of Orange by his activity and zeal in attaching the officers of the fleet to the cause of the revolution, and was advanced to the rank of captain. In 1702, he took part in the capturing and burning of the Spanish fleet at Vigo, and in the following year was made rear-admiral of the red. The attack on Gibraltar was solely confided to his command, and for his gallant conduct at the battle of Malaga he was knighted by queen Anne. In 1708, he became admiral of the blue, and commanded a squadron fitted out to oppose an intended invasion of Scotland from France, on the part of the pretender. He pursued the French fleet to the firth of Forth, took one ship, and forced the fleet back to Dunkirk, on which occasion he was presented with the freedom of the city of Edinburgh. On the breaking out of the rebellion of 1715, he was appointed to the command of a squadron in the Downs, and for important services against the French, was created a baronet. In 1718, he commanded the English fleet sent to Sicily for the protection of the neutrality of Italy, and gained a victory over the Spanish fleet off Messina. Soon after, he was appointed treasurer of the navy, and rear-admiral of Great Britain. In Jan., 1721, he was sworn one of the privy council, and in Sept. following, created baron Southhill and viscount Torrington. On the revival of the order of the bath, in 1725, he was installed one of the knights; and, on the accession of George II., was nominated first lord of the admiralty. He represented Plymouth in parliament from 1706 until 1721. Died Jan. 17, 1733.

BYNG, JOHN, a brave but ill-fated British admiral, fourth son of the preceding, b. in 1704, entered the navy early, served under his father, and, in 1727, became captain. In 1748, he had attained the rank of admiral of the red. In 1756, he was appointed to com-

mand a squadron of ten ships of the line in the Mediterranean, destined for the relief of Minorca, at that time blockaded by a French fleet under La Galissoniere. On the 20th May, B. made the signal to engage, which was obeyed by rear-admiral West with such impetuosity that several of the enemy's ships were driven out of the line; but B. not advancing to his support, the French were allowed to escape, and Minorca was lost. The dissatisfaction in England, on the news arriving, was taken advantage of by the ministry to avert the public odium from their own inefficient measures. B. was tried by a court-martial, and condemned to death, for a breach of the 12th article of war, but recommended to mercy. Sacrificed to the general indignation, he was shot on board the *Monarch*, at Portsmouth, Mar. 14, 1757, meeting his fate with firmness and resignation. In the fleet, he was not popular, being a strict disciplinarian.

BYNKERSHOEK, CORNELIUS VAN, a Dutch juriconsult, was b. at Middelburg, in Zealand, 29th May, 1673. He studied at the university of Franeker, took the degree of doctor in 1694, and immediately after commenced to practice as an advocate of the Hague. In 1703, he was elected by the states-general a member of the supreme court, and, in the exercise of his functions, soon had occasion to observe how defective and vague was the common law of the country. In 1710, with a view to remedy this, he published the first part of his *Observationes Juris Romani*; in 1719, his *Opuscula Varii Argumenti*; and in 1724, he was elevated to the dignity of president of the supreme court. In 1733, appeared the rest of his *Observationes Juris Romani*. B. now began to devote himself earnestly to the study of Dutch and international law, acquiring, of the former in particular, a most extensive and solid knowledge. His great work on this subject is his *Questiones Juris Privati*, which he did not live to finish, and on the other, his *Questiones Juris Publici*. In addition to these, B. collected (from his notes) the decisions and proceedings of the supreme court in his time, under the title *Observationes Tumultuariae*, and besides (what is perhaps his most valuable work) made a digest under the title of *Corpus Juris Hollandici et Zelandici*, of all the laws of his own country, whether statutory, or existing in the decisions of courts, or in the practice of the bar, or in the customs of particular places. He died 16th April, 1743. A complete edition of his works was published by prof. Vieat, of Geneva, in 1761.

BYRAM RIVER, a small stream, scarcely more than a brook, which is often mentioned as the farthest western boundary of New England, separating the towns of Greenwich, Conn., and Rye, N. Y. Recent surveys have straightened the boundary line, which, however, still begins at the mouth of the river and follows it a short distance. One mile above its entrance into Long Island sound, the stream widens, receives the tide, and is navigable for the smaller class of vessels to the village of Port Chester.

BYRD, WILLIAM, 1674-1744; b. Va., and educated in England, where he became a fellow of the royal society. Returning to America, he was receiver-general of revenue in Virginia, colonial agent, member of the council, and one of the commissioners to fix the North Carolina boundary. He laid out the cities of Richmond and Petersburg in 1733 on his own land.

BYRGIUS, JUSTUS, or, more properly, JOBST BÜRGI, the inventor of various astronomical instruments, was b. 28th Feb., 1552, at Lichtensteig, in the canton of St. Gall, Switzerland. In 1759, he went into the service of the learned landgraf of Hesse, Wilhelm IV. His first work was a celestial globe, the surface of which was plated with silver, and in which the stars were placed according to his own observations. The landgraf sent it to the emperor Rudolf II., who thought it so beautiful that, in 1604, he appointed B. his own mechanician. B. subsequently went to Austria, but returned to Cassel in 1622, where he died in 1633. Many of his reputed discoveries and inventions are questioned, such as those of logarithms and the proportional compasses; but he seems to have hit upon something like both, while it is certain that he was the inventor of a method of resolving spherical triangles.

BYRLAW, Birlaw, or Burlaw, the name given to a sort of popular jurisprudence formerly in use in Scotland, in villages and among husbandmen. Sir John Skene, writing in 1597, when the system was in full force, defines B. as "*leges rusticorum, de re rustica late*—laws made by husbandmen, concerning neighborhood to be kept among themselves."—*Reg. Majest.* lib. iv. c. 39; *De Verb. Signif.* voce Byrlaw. As the B. was enacted by the common consent of the villagers or neighbors, so it was administered by judges chosen by them from their own ranks. These judges were commonly called "byrlaw men," a name which is still applied in some parts of Scotland to an arbiter, oddsman, or umpire. The courts which they held were called "byrlaw courts," and took cognizance of disputes between neighbor and neighbor. B. is supposed to be derived from *boor*, or *baur*, a countryman.

BYROM, JOHN, 1691-1763; an English poet and miscellaneous writer. *Colin and Phoebe*, his first poetical essay, appeared in the *Spectator*. He was made a member of the royal society; invented and taught a system of short-hand writing: was a person of lively wit, and had a taste for the mystical theology of Böhme.

BYRON, ANNE ISABELLA MILBANKE, 1792-1860; only child of sir Ralph Milbanke, and wife of lord Byron. She married lord Byron Jan. 2, 1815, and separated from him in Feb. of the next year. On the death of her cousin, the earl of Scarsdale, she became

baroness of Wentworth, and for several years before her death employed her large income in works of charity. One child was borne by her to Byron, "Ada, sole daughter of my house and heart," who married William, lord King, afterwards earl of Lovelace.

BYRON, GEORGE GORDON, Lord, a great English poet, was b. in Holles street, London, on the 22d of Jan., 1788. He was the only son of capt. John Byron, of the guards, and Catherine Gordon of Gight, an heiress in Aberdeenshire. Capt. Byron and his wife did not live happily. Domestic peace perished in the conflict of their ungovernable tempers. The husband's habits were profligate in the highest degree, and the wife's fortune was soon squandered in the debauch and at the gambling-table. Separated from her husband, the lady retired to the city of Aberdeen with her little lame boy, whom she passionately loved, her sole income at this time being about £130 per annum. In his 11th year, B. succeeded his grand-uncle, William lord Byron; and mother and son immediately left the north for Newstead abbey, the ancient seat of the family, situated a few miles distant from Nottingham, in the romantic district which Sherwood forest shadowed, and which was once familiar with the bugle of Robin Hood. On succeeding to the title, B. was placed in a private school at Dulwich, and thereafter sent to Harrow. The most remarkable thing about B.'s early years was his extraordinary attachments. Like almost every member of the poetic tribe, he "had a passion for the name of Mary." In his 8th year, in Aberdeenshire, he fell in love with Mary Duff. Margaret Parker, a cousin of his own, and who died early, was his next idol. His strongest passion was, however, for Mary Chaworth. This lady he first met when on a visit to Newstead in 1803, at which date he was in his 15th year. Miss Chaworth's father had been killed in a duel by lord Byron, the grand-uncle of the poet, and marriage would have healed the family feud, and would have joined rich estates. But it was not to be. Miss Chaworth was B.'s senior by two years, and evidently felt little flattered by the worship of the lame Harrow boy. Next year came the parting interview described in *The Dream*, with which every Englishman is familiar now as with a personal experience. In 1805, B. removed to Trinity college, Cambridge; and two years thereafter, his first volume of verse, entitled *Hours of Idleness*, was printed at Newark. The poems therein contained were not absolutely without merit, but they might have been written by any well-educated lad who, in addition to ordinary ability, possessed the slightest touch of poetic sensibility. The volume was fiercely assailed by lord (then Mr.) Brougham in the *Edinburgh Review*, and his sarcasms stung B. into a poet. The satire, *English Bards and Scotch Reviewers*, was written in reply to the article in the *Edinburgh*, and the town was taken by a play of wit and a mastery of versification unequalled since the days of Pope. In the babble of praise that immediately arose, B. withdrew from England, visited the shores of the Mediterranean, and sojourned in Turkey and Greece. On his return in 1812, he published the first two cantos of *Childe Harold*, with immense success, and was at once enrolled among the great poets of his country. During the next two years, he produced *The Giaour*; *The Bride of Abydos*; *The Corsair*; and *Lara*. While these brilliant pieces were flowing from his pen, he was indulging in all the reveries and excesses of the metropolis. What was noblest in the man revolted at this mode of life, and, in an effort to escape from it, he married Miss Milbanke, daughter of sir Ralph Milbanke, a baronet in the co. of Durham. This union proved singularly infelicitous. It lasted only a year, and during that brief period, money embarrassments, recriminations, and all the miseries incident to an ill-assorted marriage, were of frequent occurrence. After the birth of her child Ada, lady Byron retired to her father's house, and refused to return. This event, from the celebrity of one of the parties, caused considerable excitement in the fashionable world. B. became the subject of all uncharitable tongues. The most popular poet, he was for a space the most unpopular individual in the country. In one of his letters, written from Italy some years later, referring to the slanders current at the time, he thus expresses himself: "I was accused of every monstrous vice by public rumor and private rancor. My name, which had been a knightly or a noble one since my fathers helped to conquer the kingdom for William the Norman, was tainted. I felt that if what was whispered, and muttered, and murmured was true, I was unfit for England; if false, England was unfit for me. I withdrew." The separation from his wife, and the departure from England, mark a stage in B.'s genius. A new element of power had entered into his verse; the reader feels it quite distinctly in the magnificent burst of exultation that opens the third canto of the *Childe*—

Once more upon the waters, yet once more!

Misery and indignation stimulated him to remarkable activity. Six months' stay at Geneva produced the third canto of *Childe Harold* and *The Prisoner of Chillon*. *Manfred* and *The Lament of Tasso* were written in 1817. The next year, he was at Venice, and finished *Childe Harold* there; and, in the gay and witty *Beppo*, made an experiment in the new field which he was afterwards to work so successfully. During the next three years, he produced the first five cantos of *Don Juan*, and a number of dramas of various merit, *Cain* and *Werner* being opposite poles. In 1822, he removed to Pisa, and worked there at *Don Juan*, which poem, with the exception of *The Vision of Judgment*, occupied his pen almost up to the close of his life. Morally, his Italian life was unsatisfactory, and his genius was tainted by his indulgences. At the close of his career, he was visited

by a new inspiration; the sun, so long obscured, shone out gloriously at its setting. In the summer of 1823, he sailed for Greece, to aid the struggle for independence with his influence and money. He arrived at Missolonghi on the 4th of Jan., 1824. There he found nothing but confusion and contending chiefs; but in three months, he succeeded in evoking some kind of order from the turbulent patriotic chaos. His health, however, began to fail. On the 9th of April, he was overtaken by a shower while on horseback, and fever and rheumatism followed. Medical aid was procured, and copious bleeding recommended; but this, B., with characteristic willfulness, opposed. Before death, he sank into a state of lethargy, and those who were near heard him murmuring about his wife, his sister, and his child. After twenty-four hours' insensibility, he expired on the evening of the 19th April, 1824. His body was conveyed to England; and, denied a resting-place in Westminster abbey, it rests in the family vault in the village church of Hucknall, near Newstead.

Lord B. is a remarkable instance of the fluctuations of literary fashion. Elevated to the highest pinnacle of fame in the heyday of his early popularity, he was unduly depressed after his death, when the false romance which he threw around himself and his writings began to wear away; and it is only during the last twenty or thirty years that the proper place has been found for him in the public estimation. He is high, but not the highest. The resources of his intellect were amazing. He gained his first reputation as a depicter of the gloomy and stormful passions. After he wrote *Beppo*, he was surprised to find that he was a humorist; when he reached Greece, he discovered an ability for military organization. When all the school-girls of England fancied their handsome idol with a scowling brow and a curled lip, he was laughing in Italy, and declaring himself to be the most unromantic being in the world. And he was right. Take away all his oriental wrappings, and you discover an honest Englishman, who, above all things, hates cant and humbug. In *Don Juan* and his *Letters* there is a wonderful fund of wit, sarcasm, humor, and knowledge of man. Few men had a clearer eye for fact and reality. His eloquence, pathos, and despair; his *Manfreds* and *Child Harold's*, were only phases of his mind. Toward the close of his life, he was working toward his real strength, and that lay in wit and the direct representation of human life. If his years had been extended, he would in all likelihood have deserted poetry for prose, gaudy colored fiction for sober fact; and the assertion may be hazarded, that the English novel would have boasted of another and a greater Fielding.

BYRON, HENRY JAMES, b. Manchester, Eng.; a playwright, author of many dramatic works, chiefly in burlesque, that have won popular favor. Among them are *Fra Diavolo*; *Maid and Maggie*; *Babes in the Wood*; and travesties of many of the more popular operas. Of comedies he has written *War to the Knife*; *A Hundred Thousand Pounds*; *Not Such a Fool as he Looks* (in which he played the hero); *An American Lady*; *Old Sailors*; and *Our Boys*, the last comedy achieving an almost unexampled success.

BYRON, Hon. JOHN, 1723-86; an English admiral and circumnavigator. He was the grandfather of Byron the poet. While young, he accompanied Anson around the world, and in later years experienced so much hard service that he was nicknamed by sailors "Foul-weather Jack." In 1769, he was a governor of Newfoundland, and in 1776 became vice-admiral. In 1778, he was sent with a fleet to watch the movements of count d'Estaing, who had gone to the assistance of the American colonies then in revolution; and in July of the next year, fought the count off Grenada, but the action was of little importance.

BYRON BAY lies on the n.e. coast of Labrador in North America, its lat. and long. being respectively 54° 40' n., and 57° 30' w.

BYRON ISLAND is situated in the Mulgrave archipelago of the Pacific ocean, its lat. and long. being respectively 1° 18' s., and 177° 20' east.

BYSSUS, a name given from ancient Greek and Roman times to the bundle of silky filaments by which many lamellibranchiate mollusks—bivalve shells—attach themselves to rocks or other fixed substances. The B. springs from a cavity at the base of the solitary foot of the mollusk, and its filaments, which are capable of being reproduced if destroyed, are secreted by a glandular tissue which occupies a furrow running nearly to the extremity of the foot. They are united together at the base in a common mass, and are often considerably divergent. They are guided to their place by the foot, and expand into a sort of disk at the point of attachment, so as to have a firm hold. A few common mussels in an aquarium readily afford an opportunity of observing the B., particularly when the filaments are attached to the glass sides of the vessel. In the *pinna* (q.v.) of the Mediterranean, the B. is remarkably long and delicate, has a beautiful silky lustre, is very strong, and is capable of being woven into cloth, upon which a very high value is set; but the animal which produces it is now so rare, that it is almost exclusively an article of curiosity. This manufacture was known to the ancients.

BYSSUS (Gr., a fine flaxen or silky substance), a genus established by Linnæus to include some of the lowest and most obscure forms of vegetation, and defined as having a substance like fine down or velvet, simple or feathered. Botanists sometimes ranked it among *algæ*, sometimes among *fungi*; it has been made the type of a group *byssaceæ*, and placed among lichens. Some have regarded this group as entitled to the rank of

a distinct order, "comprehending the filamentous fungi found in cellars, and similar plants;" but others reject the genus as altogether spurious. Some of the species once included in it have now been satisfactorily shown to be lichens, others to be *conferaceæ*, whilst many appear to be really not distinct vegetable forms, but cryptogamic plants prevented by unfavorable circumstances from proper development. The green incrustations formerly regarded as species of B., have been found to be the primary germination of mosses, often species of *polytrichum* and *tortula*. It cannot be said, however, that the nature of all the vegetable forms which have been referred to the genus B., has yet been satisfactorily ascertained. Some of them are very phosphorescent, and are generally found where some higher form of vegetation is undergoing decay.

BYSTRÖM, JOH. NIKOLAUS, a celebrated sculptor, was b. 18th Dec., 1783, at Philippstadt, in the province of Wermeland, Sweden, and educated under Sergell of Stockholm. In 1809, he obtained the highest prize in the Swedish academy of arts, and in the following year went to Rome, where he executed his first independent work, a "Drunken Bacchante," and sent it home. It was received with great approbation, and B. had to repeat it thrice. In 1815, he returned to Stockholm, and surprised the newly elected crown-prince by exhibiting a colossal statue of himself, which he had finished all but the head in Rome, and had found means to complete quietly in Stockholm. The crown-prince was highly gratified, and commissioned B. to execute colossal statues of Charles X., XI., and XII. After 1838, he resided in Stockholm; but returned to Rome in 1844, and died there Mar. 13, 1848. His chief works are: "A Nymph going into the Bath," "A reclining Juno suckling the Young Hercules," "Hygieia," "A Pandora combing her Hair," "A Dancing-girl," a statue of Linnæus, and colossal statues of Charles XIII., Gustavus Adolphus, and Charles XIV. B. excels in the delineation of females and children, but his male figures want strength of character; his conceptions are always true to nature, his grouping skillful and pleasant, and his execution is clear and distinct.

BYTTNERIACEÆ, a natural order of exogenous plants, sometimes united with the order *sterculiaceæ* (q. v.), and also closely allied to *malvaceæ* (q. v.), from which it differs, especially in the stamens not being columnar—although more or less united, generally into a cup or tube—also in the anthers being turned inwards, and 2-celled. The species of this order are trees, shrubs, or half-shrubby plants, abounding chiefly in tropical climates, although some are natives of the temperate zones. About 400 have been described. The flowers of many are beautiful. The most important product of the order is COCOA (q. v.). The fruit of *guazuma ulmifolia*, a native of Brazil, is eaten, being filled with a sweet and pleasant mucilage. The young bark of this tree yields, when macerated, a copious mucilage, and is therefore used in Martinique for clarifying sugar, as is that of *kythia calycina* in the northern provinces of India. *Guazuma ulmifolia* was introduced into India, and at one time largely cultivated in the Madras presidency, under the name of bastard cedar, that its foliage and young shoots might be employed as fodder for cattle. Its straight, luxuriant young branches yield a strong fiber. The bark of other species of this order also affords a tough fiber, which is employed for making cordage, particularly that of *microlæna* (or *schillera*) *spectabilis* in the regions on the southern base of the Himalaya, *abroma augustum* in various parts of India, *dombeya spectabilis* in Madagascar, and *D. umbellata* in the isle of Bourbon. *Abroma augustum* has been especially recommended to attention and cultivation on account of its fiber, which is beautiful, white, fine, and strong, and is produced in great abundance. The plant grows to be a handsome small tree, having hairy lobed leaves and beautiful drooping purple flowers; but may be treated much as willows grown for basket-making, and in this way yields two, three, or even four crops of cuttings annually, which are peeled and the bark macerated in order to the separation of the fiber.

BY-TOWN, a t. of Upper Canada, on the Ottawa, which took its name from col. By of the royal engineers. It is now *Ottawa* (q. v.), the capital of the dominion of Canada.

BYZANTINE ART. From the time of pre-eminence the great, the emperors of the east arrogated to their imperial city the pre-eminence which, for so long a period, ancient Rome had actually possessed; and, as a necessary consequence of this assumption, Constantinople, or Byzantium, as it still continued sometimes to be called, became the rival of the mother-city in the richness and variety of its artistic monuments. In Rome, and, indeed, in the whole of western Europe, the first effect produced by the influx of the mighty stream of barbarian life, and the consequent dissolution of existing society, was the almost total suppression of artistic effort. It was then that the artists of the west, willing and eager to avail themselves of the invitation held out to them, poured into Constantinople, carrying with them what yet remained of the artistic life of the ancient world. Byzantium was the hearth on which, during the dark period of the middle ages, those feeble sparks of ancient art were kept alive, which served to kindle the new and independent artistic life of the modern world. Not only were the painters and sculptors of Italy indebted to the art of Byzantium for the tradition of that ideal mode of conception to which the term classical is peculiarly applied, but artists in every department derived thence the elements of that technical knowledge without which the embodiment of such conceptions is impossible. This practical acquaintance with the technical rudiments of their respective arts, which could scarcely have been derived from a mere examination of ancient works, was communicated to the fathers of Italian

art by living Byzantines, some of them probably the descendants of those whom barbarian conquests had driven into the east, and whom the conquests of a still more barbarous race now restored to western Europe. It is impossible to doubt that modern art was largely indebted to this circumstance for the marvelous stride which it took immediately after the taking of Constantinople by the Turks. But though its chief value may consist in its having thus transmitted to us the succession of antiquity, B. A. was by no means devoid of original and individual character; and it is only in so far as it possesses this, and not when regarded as a mere conservation of antique types and processes, that it takes rank as a school of art. The characteristic element in B. A. may be described as the earliest artistic recognition and representation to the senses of what was new and peculiar in Christian as opposed to heathen life. To the fullest extent to which it could claim a separate and individual existence, B. A. was Christian art; and consequently in Germany, where the subject has received more attention than in this country, the two terms are frequently used as synonymous. The appearance of B. A., in this its only peculiar sense, dates from the age of Justinian, i. e., from the earlier half of the 6th c., and its productive period may be said to terminate with the conquest of the eastern empire by the crusaders in 1204. But though its declension dates from this event, B. A. continued to exist in considerable vigor down to the final destruction of the empire of the east, in 1453; and even now may be seen as the inseparable handmaid of the Greek church, both in Europe and in Asia. It is in this point of view, and more particularly as forming the basis of artistic life in Russia, that B. A. possesses its chief living interest in our day. What Rome was to the western, Byzantium was to the eastern European; and the relation of the latter to his mother-city, if it commenced at a somewhat later date, continued during the whole period of the middle ages.

Though the inhabitants of eastern Europe thus derived their traditions of antiquity from a meaner source than the Romaic nations, they received them more unbroken; and, from first to last, were subjected to their influences during a much longer period. To them the living voice and hand continued to communicate what for nearly a thousand years Italians, Spaiards, and Franks had had to seek in the dead image and letter alone; and if anything still remains unrecorded of ancient thought, it doubtless dwells on Greek, and not on Roman or German tongues. Indolent, luxurious, and dissolute as their ancestors had been in classical times, the citizens of Constantinople were distinguished by an intellectual character, which, unfruitful and enfeebled though it was, was systematic, subtle, mystical, and pedantic. They were eminently an instructed people; but, like individuals whose glory is in the past, they were more conservative than original; and, however justly we may despise the chaff which they engendered, it is impossible to overestimate the value of the corns of gold which clung to their memories.

BYZANTINE ARCHITECTURE. The typical form of B. A., at least as applied to ecclesiastical purposes, was fixed by the church of St. Sophia, which still exists as the great mosque of Constantinople. It was built, or rather rebuilt, by the orders of Justinian, the architects being Anthemius of Tralles, and Isidorus, the elder, of Miletus, and completed 537 A. D. Though the largest and most magnificent, the church of St. Sophia was but one of 25 churches which were erected in the capital, and of a vastly greater number of ecclesiastical structures with which the provinces were adorned by the pious emperor. The style thus introduced largely influenced the architecture even of western Europe; and in St. Mark's at Venice, the churches at Ravenna and elsewhere on the Adriatic, and even in the cathedral of Aix-la-Chapelle, we have examples of churches almost purely Byzantine. The fundamental principle in the construction of Byzantine churches was an endlessly varied application of the Roman arch, whilst its exhibition in the form of the cupola was their most characteristic feature. In the St. Sophia, as was generally the case, the cupola covered the principal central portion of the church, and was supported by strong and lofty pillars, bound together by bold arches. To this central space were usually joined others of smaller size, which were covered by half-cupolas or arches of more ordinary construction. Though frequently in the form of a Greek cross, with the great cupola rising in the center, and smaller or semi-cupolas surmounting the four arms, neither this nor any other plan was consistently adhered to in Byzantine churches. The windows were always semicircular, similar to those in the Romanic churches of Germany, and in our own Saxon or early Norman churches; but the doors were frequently square-headed, after the classical model. Many of the details, such as the square capitals tapering downwards, and the bold projecting moldings ornamented with foliage, seem to have owed their origin entirely to the ingenuity of Byzantine architects. The earlier Byzantine churches were profusely ornamented with mosaics, which, after the admixture of the Gothic element, and the adoption of the pointed arch, gave place to fresco-paintings. The constant use of the apse (q. v.) is, after the cupola, perhaps their most marked feature. The following division into periods, though, like most divisions of the kind, somewhat arbitrary, has the authority of M. Couchaud, an eminent French architect, in its favor, and is, apparently, adopted by Parker: 1. From the time of Constantine to the middle of the 6th c.; 2. From the beginning of Justinian's reign down to the 11th c., which comprises the greater part of the existing buildings of the pure Byzantine type; 3. From the 11th c. to the conquest of Greece by the Turks,

when the influence of the Venetian conquests is apparent in the intermixture of Italian and Gothic details and characteristics.

BYZANTINE SCULPTURE. When contrasted with the ignoble, tasteless, and meaningless productions of the later plastic art of Rome, that of Constantinople claims both admiration and respect. The figures are not deficient in dignity either in form or in attitude, and a deeply Christian spirit is traceable both in their general conception, and in their rich and significant symbolical accompaniments. In sculpture, as in architecture, the peculiar Byzantine type first exhibits itself towards the beginning of the 6th century. Alongside of unmistakable reminiscences of the antique, it exhibits characteristics which are as unquestionably oriental. The figures are positively laden, not with drapery alone, but with costume, which obscures the nobler and freer lines in which the ancients delighted. The execution is careful, even painful. All this becomes more and more the case as we advance in the order of time, the earliest Christian works, and those immediately suggested by the antique, exhibiting such faults only to a limited extent. Down to the 12th c., the defects which we have described were the worst which could be laid to the charge of B. sculpture, and it is scarcely earlier than the 13th c. that it assumes that mummy-like aspect by which it is too generally known. The art of carving in ivory was practiced with great success at Constantinople, and in the examples of it which remain, the gradual decline—the *benumbing process*, as it has been aptly called—may be traced with great distinctness. Of this species of work, in its earlier and better time, a fine specimen in alto-rilievo of the “forty saints” may be seen in the museum at Berlin. The decorations of the churches, and of the sacred vessels used in the service of the altar, formed no insignificant objects of art in the better Byzantine period. Cups, plates, lamps, candlesticks, crosses, and the like, were either of gold or silver, and frequently adorned with jewels; whilst the altar itself, the chancel, and sometimes the whole interior of the church, were covered with precious metals, the panels being adorned with mosaics or frescos.

BYZANTINE PAINTING. The same characteristics which we have ascribed to the sculpture belonged to the pictorial efforts of the artists of Byzantium, and of the neighboring countries who were mostly their imitators. The execution was careful and anxious rather than skillful, and such skill as still remained was exhibited in the mechanical perfection with which the gilding of the backgrounds and other details were managed. Of B. pictures, the best existing specimens are to be found in Italy, and belong especially to the school of Sienna. The picture of the Virgin in the church of St. Domenico at Sienna by Guido, bearing date 1221, deserves special mention. Much labor was expended on the illumination of MSS. of the Scriptures, and of these many beautiful examples, as fresh as when they were painted, may be seen in most of the larger public libraries of Europe. The chief interest attaching to B. painting consists in the parental relation in which it stood to the art of Italy. Cimabue may be regarded as its immediate heir; and in the works of Giotto, Leonardo da Vinci, Pietro Perugino, and even of Raphael in his earlier time, the traces of the inheritance are quite unmistakable. See PAINTING.

BYZANTINE EMPIRE, also styled the **EAST ROMAN, EASTERN, OR GREEK EMPIRE**, was founded in 395 A.D., when Theodosius the great, at his death, divided the Roman empire between his two sons, Arcadius and Honorius. The former, a weak and luxurious character, was made emperor of the eastern division, formerly included under the prefectures of the east and of Illyricum—namely, Syria, Asia Minor, and Pontus, stretching along the shores of the Black sea in Asia; Egypt in Africa; and Thrace, Mœsia (now Bulgaria), Macedonia, Greece, and Crete in Europe. Arcadius left the government of the empire in the hands of his minister, Rufinus, from whom it passed to the eunuch Eutropius, and afterwards to Gainas, the murderer of Rufinus. Gainas fell by his ambition in 401, and the shameless and avaricious empress Eudoxia ruled until the time of her death, 404. See **ARCADIUS**. After Theodosius II., a minor, under the guidance of the prefect Prætorio Anthemius, had held the reins during six years, he resigned the government in favor of his sister Pulcheria (Augusta), who ruled powerfully while her brother was kept apart from all state affairs. Western Illyria (comprehending Pannonia, Dalmatia, and Noricum) was ceded to the Eastern empire by the Roman emperor, Valentinian III.; and after several victories achieved by the Byzantine general, Ardaburius, over the Persians, a part of Armenia was also annexed. But, nevertheless, Thrace and Macedonia could only be secured from the destructive conquests of Attila by the payment of tribute. After the death of Theodosius II., Pulcheria married the senator Marcianus (450-57), whose firmness repelled the invasions of Attila. Marcianus was followed by Leo I., surnamed Macella (the butcher), a Thracian of low birth, but elevated to the throne by the commander-in-chief, Aspar, who, being himself an Arian, would not venture to encounter the perils that sovereignty might have entailed on one of his religious views. Leo II., grandson of the former, succeeded, but died after a few months, in consequence of which the crown came into the possession of his father, Zeno (474-91), who was banished by Basiliscus (475), but who re-ascended the throne in 477. Though a weak and unpopular ruler, he contrived to retain his power in spite of several serious revolts. The internal distraction of the empire, to which, as at other times, religious strifes added considerably, increased greatly during the reign of Zeno,

and the invasions of the Goths were prevented only by gifts and stratagems. Ariadne, widow, of Zeno by her second marriage raised the courtier Silitarius to the throne under the title Anastasius I. (491-518). By the help of the Goths, this monarch overthrew, after a six years' contest, the robber tribes at Mt. Taurus. A new enemy, however, now appeared on the Danube in the Bulgarians, against whose desolating raids Anastasius built the long wall, to protect the peninsula on which Constantinople lies. The war with the Persians also broke out anew during his reign; and religious tumults often purpled the streets of Constantinople itself. After his death, the army raised Justinus I. to the throne. He maintained his position mainly through the favor of the clergy, whom he had conciliated by his severe persecution of heretics.

His nephew, Justinian (q.v.), succeeded (527-65), and became celebrated by his code of laws, and by the victories of his great generals, Belisarius (q.v.) and Narses (q.v.). But the rapid decline of the empire after his death showed that he had not been able to give it any internal consolidation or vitality. It was during the reign of Justinian that those pestilent contests of the blues and whites against the greens and reds (political factions so named from the colors respectively worn) first attained any consequence; and though the first disturbance was terribly chastised by Belisarius in 532, they continued to distract the capital periodically down to the 7th century. Justin II. (565-78), a weak man, governed by his wife, Sophia, yielded a part of Italy to the Longobards, was unsuccessful against the Persians, allowed the Avari to plunder the Danubian provinces, and ultimately became insane through vexation and anxiety. Tiberius, the capt. of the guard, was then made regent, and after the death of Justin II., received the imperial dignity. He ruled with mildness and prudence (578-82), purchased a peace with the Avari, concluded the war with Persia, and left as his successor the commander-in-chief, Mauricius, who reigned from 582 to 602. Having replaced on the throne the Persian king, Kosroes II., who had been banished by his subjects, he thus secured the peace of his eastern frontiers; but, on the other hand, the war against the Avari did not prosper. His niggardly treatment of the army caused a military insurrection, in which he was slain along with his son; and Phocas, one of his generals, was elevated to the throne. Phocas proved a bad ruler. Through his monstrous vices, tyranny, and incapacity for government, the empire lapsed into still deeper anarchy. Suddenly, however, a deliverer appeared in the person of Heraclius (q.v.), son of the exarch or governor-general of Africa, who headed a conspiracy, marched to Constantinople, overthrew the tyrant, and ascended the throne, 610. But great as was the genius of Heraclius, he had to submit to twelve years of defeat before he could organize and discipline a victorious army. In 622, he opened those magnificent campaigns in which the power of Persia was crushed, and which, in the opinion of Gibbon, were equal to those of Scipio or Hannibal. He lived, however, to see more formidable foes in the Arabs, who, inspired by fanatic zeal, and led by the caliph Omar, captured, during 635-41, the countries on the Euphrates, with Syria, Judea, and Egypt. The power of the Greeks, which was demanded to resist the Arabian invasions, was miserably divided and weakened by their unending religious quarrels, especially the controversy of the Orthodox against the Monothelites (q.v.). The empire was breaking asunder, and Heraclius, now worn out with the fatigues of war, had abandoned his enfeebled senses to pleasure, and his enfeebled intellect to theological discussions. He died in 644. Constantine III., who succeeded his father, Heraclius, also died soon after, and was followed by Heraclionas, who lost the crown, and was mutilated in an insurrection. The next ruler was Constans, the son of Constantine III., who ruled from 642 to 668, made himself odious by cruelty, and perished in an insurrection. His son, Constantine IV., Pogonatus (668-85), enforced a treaty of peace on the invading Arabs (675) by his successful use of the Greek fire, in warfare. On the other side, he was compelled to pay tribute in 680 to the Bulgarians, who had established themselves in ancient Mæsia. Justinian II. (685-711), son and successor of Pogonatus, was victorious in war against the Monothelite Maronites; but was defeated by the Bulgarians (688), and by the Arabs (692). His cruelty caused an insurrection, at the head of which was Leontius, who, in 695, deposed him, cut off his nose (hence his surname *Rhinotmetus*), and banished him to the Tauric Chersonese; in 705, he was restored to the throne, but adversity had taught him no wisdom. A part of his subjects revolted, and the king, abandoned by his army and by the Bulgarians, was assassinated in 711. With him the dynasty of Heraclius expired.

Philippicus Bardanes (the leader of the last insurrection against Justinian II.) was next raised to the throne (711); but having made himself odious by favoring the metaphysical tenets of the Monothelites, he was deposed, and brutally deprived of eye-sight (713). His successor, Anastasius II., prudently screened himself from a mutinous army by retiring into a monastery (716), and left the crown to Theodosius III., who abdicated in 717 when Leo, the Isaurian, and gen. of the army of the east, did not recognize him, and marched with hostile intent to Constantinople. Leo (q.v.) himself ascended the throne in 717, and drove back the Arabs from Constantinople, but unhappily gave occasion, in 726, for that contest concerning the worship of images, which rent the empire for more than a century. In 728, the exarchate of Ravenna was lost, and the eastern provinces became the prey of the Arabs, over whom, however, he won a great victory in Phrygia. He died in 741. Constantine V. (741-775), son of Leo III., on account of his zeal as an iconoclast, was hated by the monks, who gave him the surname "Cop-

ronymos," because (according to their malicious and uncleanly statement) he had polluted the font at his baptism. He was a brave ruler, recovered from the Arabs parts of Syria and Armenia, and ultimately defeated the Bulgarians, against whom he had long been unsuccessful. His son, Leo IV. (775-780), was a mild ruler; but by the ability of his generals, he made the boundaries of the empire secure against the Arabs. After him, Constantine VI. ascended the throne under the guardianship of his ambitious mother, Irene (q. v.), who raised a powerful party in favor of image-worship. Constantine having made an attempt to liberate himself from the influence of his mother and her paramour, Stauratius, Irene barbarously caused her own son to be blinded (797). He died soon after this atrocity; and Irene, who had boldly conceived the design of marrying the emperor Charlemagne, and thus uniting the e. and w. of Europe in one vast realm, excited the opposition which, in 802, placed her treasurer, Nicephorus, on the throne. Irene was banished to Lesbos, where she died in 803. Nicephorus, who fell in battle against the Bulgarians (811), was succeeded by his son, Stauratius, who soon yielded the throne to his brother-in-law, Michael I., from whom it was taken by the Armenian gen., Leo V., a powerful ruler, who conquered the Bulgarians, but fell (820) in a conspiracy excited by his zeal against image-worship. Michael II., the stammerer, was raised from a dungeon to the throne, and ruled until 829. In his reign, Crete and Sicily passed into the hands of the Arabs. Under the rule of his son, Theophilus, who is praised by the Byzantine historians for his love of justice (829-842), the gen., Manuel, gained some indecisive victories over the Arabs. Theodora, widow of Theophilus, and guardian of Michael III. (842-867), brought the controversy about images to a close at the council of Nicea (842), when the worship of these was fully sanctioned and re-introduced. During this reign the government busied itself in the persecution of the Paulicians (q. v.), while the Arabs devastated the Asiatic provinces. Theodora, having been banished to a convent by her son, the government was for some time held by Bardas, uncle of Michael III., and after his assassination, by Basilus I., the Macedonian, who caused Michael to be put to death, and afterwards ruled ably from 867 to 886. But though on the whole successful against the Arabs, the latter contrived to make themselves masters of Syracuse. His dynasty (the Macedonian) maintained itself on the Byzantine throne, with some few interruptions, until 1056. The reign of his son, Leo VI., the philosopher, (886-912), was not prosperous. The inroads of the Bulgarians and of the Arabs, who, in 904, plundered Thessalonica, continued to increase during the government of his son, Constantine VII., Porphyrogenitus, who ruled mildly but feebly (912-959). Under his son, the dissolute Romanus II. (959-963), Crete was retaken from the Arabs by the vigor of his gen., Nicephorus Phocas, who, on the death of the emperor, married his widow, Theophania. She, however, caused him to be murdered in 969, as she wished to marry John Tzimiskes, who ruled till 976, and, like his predecessor, was victorious against the Arabs and Bulgarians, as also the Russians, who about this time began to emerge from obscurity as an enemy of the Byzantine power. His successor, Basilus II. (976-1025), the son of Romanus, conquered the Bulgarian kingdom, and attached it as a province to the empire, which it remained till 1186, when it again became independent. His brother, Constantine VIII. (1025-28), did not resemble him. Romanus III. next ascended the throne, but was assassinated by his wife, Zoe, a profligate but crafty princess, who raised successively to the imperial dignity Michael IV. (1034), Michael V. (1041), and Constantine IX. (1042). Meanwhile, Russians and Arabs devastated the realm. In Asia, the Seljuk Turks proved dangerous enemies; while in lower Italy, the Normans narrowed the Byzantine power to the possession of Otranto. After Constantine's death in 1054, Theodora, sister of Zoe, was elected empress; and on her death in 1056, Michael VI., who was deposed by Isaac I., Comnenus.

With Isaac I., Comnenus, who came to the throne in 1057, the dynasty of the Comnenian emperors began. He retired to a monastery (1059), and was succeeded by Constantine X., whose widow, Eudocia, married Romanus IV., and raised him to the throne. Romanus was deposed in 1071 by Michael VII. (son of Constantine X.), who, in his turn, was dethroned by Nicephorus III. (1078), who reigned until 1081, when he was deposed by Alexius I., Comnenus (q. v.), (1081-1118). This last reign was marked by the commencement of the crusades. The successors of Alexius—his son, Kalo-Joannes (1118-43), and Manuel I. (1143-80)—were able rulers, and victorious in their engagements with the Turks. Manuel's son, Alexius II., was murdered by his guardian, Andronicus (grandson of Alexius I.), who raised himself to the throne. He was the last prince of the Comnenian dynasty, and fell in an insurrection excited by his own cruelty, 1185.

After the first turbulent reign of Isaac II., who was blinded and deposed by his brother, Alexius III., who took the surname of Comnenus in 1195, the crusaders restored Isaac to the throne (1203), and also crowned his son Alexius IV.; but the restless citizens of Constantinople elected Nicolas Kanabus, who took the title of Alexius V., and pursuing the usual bloody course, put his predecessor to death.

In 1204, the French and the Venetians (collectively named *Latins*) advanced on Constantinople, and captured the city, April 12, having made themselves masters of the European provinces. The whole was divided into four parts, of which the first, including the metropolis, fell to the lot of Baldwin, count of Flanders, who was made emperor, and to whom the other participants in the expedition did fealty for their respective shares. The Venetians obtained the coasts of the Adriatic and Ægean seas, a part of

the Morea, and several islands; Bonifacius, count of Montferrat, Macedonia, and part of Greece; several dukedoms, countships, etc., were also established at Athens, Philippopolis, and other places for French knights; while a number of Greek princes, both on the mainland and in the islands, maintained their independence. In the w. of Asia Minor, Theodorus Lascaris, who had been elected emperor at Constantinople, formally transferred the seat of government to Nicaea; and finally, in the n.e. of Asia Minor, the governor of the province of Colchis, Alexius Comnenus, ruled at Trebizond with absolute authority; while one of his successors, John Comnenus, even assumed the title of emperor. At Constantinople, neither Baldwin nor his successors could strengthen the sinking empire. Baldwin himself died (1206) a prisoner in the hands of the Bulgarians. After him came his brother Henry, who ruled bravely and wisely till 1216. For the next four years, the empire was actually without a ruler, and a prey to utter anarchy. In 1221, Robert, son of Peter, count of Auxerre and Courtenay, came to the throne; and was succeeded by John of Brienne, titular king of Jerusalem (1228-37); and the latter by Baldwin II. (1237-61). During these reigns, a great part of the empire was seized by John Vatazes, successor of Theodorus Lascaris of Nicaea (1222-55). This ruler was followed in Nicaea by Theodorus II. (1255-59), whose son, Johannes, during his minority, was superseded by Michael VIII., Palaeologus, who, by the help of the Genoese, captured Constantinople (July 25, 1261), and thus put an end to the Latin dynasty; though some few Latin principalities maintained themselves till the fall of the Byzantine empire.

Michael, the first of the Palaeologi, a powerful prince, really endeavored to strengthen the realm; but, by his unhappy attempt to unite the Greek church with the Latin, from which it had decisively separated (1054), he gave great offense to the clergy and the people. His son, Andronicus II., who came to the throne, 1282, re-established the Greek ritual. After the death of his son and co-regent, Michael IX. (1320), Andronicus II. was compelled to divide the throne with his grandson, Andronicus III., who became sole emperor, 1328. This monarch unsuccessfully opposed the Turks, who took Nicaea and Nicomedia in 1339, and wasted the European coasts. He died in 1341. Under his son, Johannes V., the Turks first gained a firm footing in the European provinces, and spread themselves from Gallipoli (which they captured in 1357) over other districts. Sultan Murad took Adrianople, 1361, and made it the seat of government. He and his follower, Bajazet, conquered all the Byzantine territories as far as Constantinople. Manuel II., son and successor of Johannes, was besieged in Constantinople by Bajazet, who defeated an army under Sigismund of Hungary, at Nicopolis, in 1396, and compelled the Byzantine monarch to cede to the Turks one of the main streets of the city, which was saved from capture only by Timur's incursions into the Turkish territories, 1402. By this diversion Manuel recovered some portion of the Byzantine provinces; but made so little use of the occasion, that, in 1422, the metropolis was again besieged by Murad II., who, after he had overthrown the force sent to aid the emperor by Ladislaus, king of Hungary, at the battle of Varna, made Constantinople, in 1444, the limit of the domains of Johannes VI., son of Manuel, and compelled him to pay tribute. Constantine XI., brother of Johannes, bravely but fruitlessly contended against the overwhelming Turkish forces, and fell heroically in the defense of Constantinople, which was captured by Mohammed II., May 29, 1453, when the B. E. was brought to a close. The petty Latin princes who existed here and there in Greece, and the despots, Demetrius and Thomas, who ruled in the Morea, were subdued by Mohammed in 1460; while David, a member of the Comnenian dynasty, the last emperor of Trebizond, submitted in 1461.

It is almost superfluous, after this painful and bloody record of dynastic crimes and tumults, continuing century after century for upwards of a thousand years, to affirm that the history of the world never witnessed so miserable and degraded a caricature of imperial government as the B. E. affords, or to express the conviction that nature was sternly satisfied to behold it finally swept from the face of the earth, even by the hands of barbarous Turks.

The constitution of the B. E. was founded on the institutions of Diocletian and Constantine the great, and was purely despotic. The emperors, who were consecrated by the patriarchs of Constantinople, claimed, as the true descendants of the Cæsars, a sovereignty over the west as well as the east, and styled themselves "rulers of the Romans," even after Charlemagne had founded a new dynasty. Though great influence was at various times exercised by the clergy as well as by women, courtiers, and ministers, the emperors were pure autocrats, having supreme power in all departments of government, and being themselves superior to all laws. By pompous titles, by great splendor of costume, and by a strict observance of an elaborately minute court ceremonial, as well as by the cruel penalties inflicted for any insult offered to the imperial dignity, or to the dignity of the emperor's relatives, they kept themselves sacredly apart from the people. Gradually, everything disappeared that might have been a check upon the utter despotism of the supreme power. As early as the 6th c., the consulate was absorbed into the mass of imperial honors, while the traces of the senate which Constantine had established at Byzantium, and which was composed of those on whom the emperor had bestowed the dignity of patriciate, as well as the chartered privileges of the towns, had entirely vanished in the 10th century. The privy council, to whom the conduct of the state was intrusted, was arbitrarily chosen by the emperor. The state officials were very numer-

ous, and their respective ranks carefully distinguished. They were raised far above the populace by titles and privileges, but were utterly dependent on the throne. Among these, the *domestici* (including many eunuchs), claimed the highest rank as immediate attendants on the emperor. The rank of the *europalates*, who had charge of the four chief imperial palaces, became, in course of time, subordinate to that of the *protovestarius*, who was invested with the highest dignity of all. The domestici were made commanders-in-chief of the army. Among them, the *domesticus* of the east (styled, *par excellence*, *megadomesticus*) held the highest rank, and finally, under the Palæologi, was considered the first civil and military officer of the realm. The provinces were ruled by governors bound to contribute certain sums to the royal revenue, which gave rise to oppressive exactions. No distinction was made between the state-revenue and the privy-purse. For military service, the land was divided into districts (*themata*); and the army, down to the later times, consisted almost entirely of foreign mercenary troops, the imperial body-guard, or *spatharii*, who were mainly Germans, holding the highest rank. The admiral of the fleet was styled *megas dux*. In the midst of constant internal and external disturbances, the administration of justice was grossly neglected and abused, though Justinian and other emperors earnestly endeavored to establish just laws.

BYZANTINE HISTORIANS are those Greek writers who have handled the history of the Byzantine empire. They are divided into three classes—1. Those whose works refer exclusively to Byzantine history; 2. Those who professedly occupy themselves with universal history, but at the same time treat Byzantine history at disproportionate length; 3. Those who write on Byzantine customs, antiquities, architecture, etc. The B. H. are far from faultless, yet, as they are the only sources of information regarding the vast empire of the east, they are invaluable to us. The most interesting and instructive among them, however, are those who confine their attention to a limited number of years, and to the events which transpired under their own observation, or in which they took part. The principal B. H. were collected and published at Paris in 36 vols., with Latin translations under the editorship of P. Philippe Labbé, a Jesuit, and his successors (1648–1711). This magnificent collection was reprinted, with additions, at Venice, 1727–33. In 1828, Niebuhr, assisted by Bekker, the Dindorfs, and others, began a *Corpus Scriptorum Historiæ Byzantinæ*, carried on till 1855, and continued in 1872 by the *Bibliotheca Græca Mediæ Ævi*.

BYZANTINE RECENSION, the Greek New Testament used in Constantinople after that city became a see in the eastern church: also used as the basis of the old Slavonic version. It differs very little from the received text.

BYZANTINES, in numismatics, is the term applied to coins of the Byzantine empire. Byzantine coins are of gold, silver, and bronze; bear impressions distinct from those of the earlier Roman coins; and were copied in several countries where the Byzantine standard was adopted. The commercial relations of the eastern empire served to distribute its coinage over almost all the then known world. It was current in India, as well as in the n. of Europe. Recently, an increased attention has been paid to the study of Byzantine coins as aids to history.—Saulcy, *Essai de Classification de Suites Monétaires Byzantines* (Metz, 1836).

BYZANTIUM, a city which stood on the Thracian Bosphorus, was first founded by emigrants from Megara in 667 B.C., and rapidly rose to importance as a seat of commerce. Its position was at once secure and enchanting; it commanded the shores of Europe and Asia, had magnificent facilities for trade, and was also encircled with rich, picturesque, and varied scenery. After a time of subjugation under Darius Hystaspes, B. was liberated from the Persian yoke by Pausanias. Along with other Grecian seaports, B. revolted from Athens in 440 B.C., but was captured by Alcibiades (408). Lysander recovered it for the Lacedæmonians in 405. Shortly afterwards, it renewed its alliance with Athens, and in 390, Thrasybulus altered its form of government from an oligarchy into a democracy. When Athens again acquired a dangerous importance as a naval power, B., in 356, leagued itself with Chios, Rhodes, and king Mausolus II., of Caria, and crippled the trade of the former city; with which, however, it again formed an alliance, through the influence of Demosthenes, in opposition to Philip of Macedon, who, in 341–340 B.C., vainly besieged Byzantium. Under Alexander the great, B. retained a certain degree of independence. For some time, B. was tributary to the Gauls, who settled in Thrace, after the death of Brennus (280 B.C.). After the second Punic war, when the Romans began to interfere in the affairs of Grecian and Asiatic cities, B. attached itself to Rome, and, retaining almost entire its former liberties, maintained also its commercial importance. In the civil war between Septimius Severus and Pescennius Niger, B. sided with the latter. It was therefore besieged by Severus, and, after a brave defense of 3 years' duration, was captured in 196 A.D., and reduced to ruin. Severus, repenting of the desolation which he had made, rebuilt a part of the city under the name of *Augusta Antonina*, and ornamented it with baths, porticos, etc. Caracalla restored to the inhabitants their ancient privileges; and in 330 A.D., under the name of New Rome or Constantinople, it was made the metropolis of the Roman empire. See CONSTANTINOPLE.

BZOVIUS, or **BZOWSKI**, ABRAHAM, 1567–1637; a Polish Dominican, one of the most voluminous writers of his time. He was professor of philosophy and theology at Milan and Bologna. He continued the ecclesiastical annals of Baronius from 1198 to 1532.

C

C THE third letter in all the alphabets derived from the Roman. It corresponds in place to the Greek gamma (Γ), and had originally the same sound—viz., that of *g* in *gun*; as is expressly recorded, and as is proved by very old inscriptions, on which we read *leciones*, *lece*, for what were afterwards written *legiones*, *lege*. This medial or flat guttural sound of *c* was at an early period of Roman history lost in the sharp guttural or *k*-sound (see ALPHABET), and this continued to be the pronunciation of the letter *c* in Latin down at least to the 8th c. of the Christian era, not only in such words as *comes*, *clamo*, but also before the vowels *e* and *i*. Such Latin words as *Cicero*, *fecit*, are uniformly represented in Greek by *Kikero*, *phakit*; and in the times of the empire, the Germans borrowed *Kaiser*, *keller*, from *Cæsar*, *cellarium*.

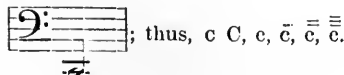

It seems difficult, at first sight, to account for the same letter having sounds so different as those heard in call and in civil. The beginning of the transition is to be found in the effect produced upon certain consonants by their standing before *i* followed by a vowel. Thus, in *nation*, *ti* has the effect of *sh*; and out of *diurnal* has sprung *journal*. In such combinations, *i* is originally a semi-vowel having the force of *y*, and it is easy to see that *tyon*, *dyur*, pronounced in one syllable, cannot but slide into the sibilant or hissing sounds of *shon*, *jur*. A precisely similar effect is produced on the *k*-sound before *ia*, *iu*, *io*; in *Lucius*, *Porcia*, or rather *Lukyus*, *Porkya*, *ky* tends to slide into a hissing sound similar to that of *ty* and *dy*. This tendency showed itself early in the Latin tongue; and in the vulgar Latin of later ages, and in the Romanic tongues that sprang out of it, it fully developed itself, so that the Italian came to pronounce *Luoia* as if written *Lutshia*. Combinations like *ceo*, *cea*, are little different from *cio* and *cia*, and would naturally follow the same course; and the *s*-sound being once associated with the letter *c* in these positions was gradually extended to it in cases where the *e* or *i* was not followed by a vowel.

The Anglo-Saxon alphabet resembled the Roman, from which it sprang, in having no *k*, and in always using *c* with the sound of *k*; *king* and *keen* were spelled *cyning* and *cene*. It was also without *q*, for which *cw* was used—*quick* being spelled *cwic*. By a process analogous to that described above, such Anglo-Saxon words as *ceort*, *ceosan* (pro. *kyort*, *kyosan*), became transformed into the English *churl*, *choose*. And this suggests a natural explanation of the multitude of cases where the *c* of the Latin has been transformed into *ch* in French, and has passed in this form into English—e.g., Lat. *caput*, Fr. *chef*, Eng. *chief*; Lat. *caminus*, Eng. *chimney*; Lat. *carmen*, Eng. *charm*. For as the Anglo-Saxons turned the *karl* or *kork* of the other Gothic nations into *kyort*, so doubtless the Romanized Gauls corrupted the pronunciation of the Latin *camera*, for example, into *kyamera* (compare Eng. *cart*, pro. by some *kyart*), which would then readily slide into *chambre*.

In the other Germanic alphabets, which were derived partly from the Roman and partly from the Greek, the Greek *kappa* or *k* is used almost to the exclusion of *c*, which, in German, Swedish, etc., appears only in words borrowed from the Romanic languages. See letter K.

In modern English, *c* is pronounced like *k* before the vowels *a*, *o*, *u*, and like *s* before *e*, *i*, and *y*; and where the sharp guttural sound has to be represented before *e*, *i*, and *y*, the Germanic *k* has superseded the Anglo-Saxon *c*, as in *king*, *keen*. In so far as mere sound is concerned, *c* is a superfluous letter in English; in every case its power could be represented either by *k* or by *s*. In the corresponding words of the several Aryan languages, we find various substitutions for *c*, thus: Lat. *calamus*, Eng. *halm* (stalk), Rus. *soloma*; Lat. *cord-*, Eng. *heart*, Rus. *serdtse*; Lat. *collum*, Ger. *hals* (neck); Lat. *acer* (sharp); Fr. *aigre*, Eng. *cager*; Lat. *duc-* (lead or draw), Ger. *zog*, Eng. *tug*; Gr. *pepo*, Lat. *coquo*, Eng. *cook*; Lat. *dictus*, Ital. *ditto*. *C* sometimes disappears before *l* and *r*; thus: Gr. *kleo* (to sound one's fame, allied to *kaleo*, to call or shout), Lat. *laudo*, to praise, Ger. *laut*, voice, Eng. *loud*, old Ger. *hlud*, fame (hence *Hludwig* or *Clodowig*, *Clovis*, *Louis*).

C, in music, is the name of one of the notes of the gamut. The scale of *C* major has neither flats nor sharps, and therefore is called the natural scale. The different octaves of the gamut, beginning with *C*, are called by the Germans the great, small, one-stroked, two-stroked, etc., beginning with

C is also the sound on which the system of music is founded, and from which the mathematical proportions of intervals are taken; that is, a string of a given length sounding *C*, when divided into certain proportions, is made to produce harmonically the intervals of the different fundamental chords.

C MAJOR, the first of the twelve major keys in modern music; being the natural scale, it has no signature.

C MINOR, the tonic minor of C major, has three flats for its signature—viz., B flat, E flat, and A flat.

CAABA. See KAABA.

CAA'ING WHALE, *Globicephalus deductor*, an interesting cetaceous animal, which has been very generally included by naturalists in the genus *delphinus* with dolphins (q.v.) and porpoises (q.v.), being named by some *delphinus melas* (Gr. black), by others *D. globiceps*, from the round form of its head, but which has recently been separated from the true dolphins, either as a species of porpoise (*phocæna*), or as the type of a distinct genus, *globicephalus*, principally characterized by the rounded muzzle, and the convex and rounded top of the head. The general form of the animal is not unlike that of the common porpoise, but it is much larger, being from 16 to 24 ft. in length. The body is thick, its circumference at the origin of the dorsal fin, where it is greatest, being rather more than 10 ft., tapering towards the tail, which is deeply forked. The pectoral fins are remarkably long and narrow, fully 5 ft. in length, differing very much in this respect from those of every other known cetaceous animal. The whole number of vertebrae is 55. The color is black, with a white streak from the throat to the vent; and the skin is beautifully smooth, shining like oiled silk.

The C. W. feeds on cod, ling, and other large fishes, but also to a great extent on cephalopodous mollusca, the cuttle-fish, indeed, seeming to be its principal food. It is the most gregarious of all the cetacea, great shoals or herds being usually seen together in the northern seas which it inhabits. These herds exhibit the same propensity with flocks of sheep, when pressed by any danger, to follow their leaders, so that when they are hemmed in by boats, if one break through to the open sea, all escape; but if one is driven ashore, the rest rush forward with such blind impetuosity as to strand themselves upon the beach, where they become an easy prey and rich prize to their pursuers. The appearance of a herd of caaing whales in a northern bay produces a scene of great excitement, and every boat is in requisition. From 50 to 100 whales are often captured, and it is recorded that 1110 were killed, in the winter of 1809-10, at Hvalfiord, in Iceland. The word *caaing* is not the Scottish form of *calling*, as has been supposed, but is a totally different Scotch word, which signifies *driving*. C. W. appears to be originally an Orkney or Zetland name. The same animal is known to sailors as the black whale, the howling whale, the social whale, and the pilot-fish.—Another species of the same genus, *G. vissonus*, 9 or 10 ft. long, the male of a bluish-white color, the female brown, both sexes marked with irregular white lines and brown spots, is found in the Mediterranean.

CABAGAN', a thriving t., situated at the northern extremity of the island of Luzon, one of the Philippines. Pop. upwards of 11,000.

CABAL', a term employed to denote a small, intriguing, factious party in the state, and also a union of several such, which, for political or personal ends, agree to modify or sacrifice their principles. The word was used to describe an English ministry in the reign of Charles II., the initials of whose names composed CABAL—viz., Clifford, Ashley, Buckingham, Arlington, and Lauderdale. This was not the origin of the word, however, as some have supposed; but merely the ingenious application of a word previously in use, and which appears to have been derived from the French *cabale*, possessing a similar signification.

CABALA. See CABBALA, *ante*.

CABANEL, ALEXANDRE, b. 1823; a French painter of mythological and religious subjects, among which are "The Birth of Venus" (of which he made two copies for American patrons), and "Nymph carried off by a Faun." He is a member of the French academy, and a professor in the school of fine arts.

CABANIS, PIERRE JEAN GEORGES, a French physician, philosophical writer, and partisan of Mirabeau in the revolution, was b. at Cosnac, in the department of the Charente-Inférieure, 1757. When he had completed his studies in Paris (1773), he went to Warsaw, in the capacity of secretary to a Polish magnate. On his return to Paris, he was for some time engaged in literary pursuits, from which he turned his attention to an earnest study of medicine. At the outbreak of the revolution, he attached himself to the liberal side, but detested the cruelties which followed. For Mirabeau, whose opinions he received, he wrote a work on national education, which was published after the death of that great orator (1791). C. was one of the council of five hundred, afterwards member of the senate, and administrator of the hospitals of Paris. He died May 5, 1808. His chief work, *Rapports du Physique et du Moral de l'Homme*, completed in 1802, gained its author a considerable reputation as a writer and philosopher. The work displays no mean power of observation and analysis, but is characterized by a sensationalism so absolute, that it seems at first sight as if the author were burlesquing with grave irony the doctrines of his brother-materialists. He denies that the soul is an entity; it is only a faculty; and declares the brain to be merely a particular organ specially fitted to produce thought, as the stomach and the intestines perform the function of digestion. C. traces this grotesque analogy through all its niceties, and at last triumphantly concludes, "that the brain digests impressions and organically secretes thought!"

CABARRUS, a co. in s.w. North Carolina, on the N. C. railroad, watered by Rocky river; 350 sq.m.; pop. '70, 11,954—3929 colored. Soil moderately fertile, producing corn, wheat, cotton, etc. Co. seat, Concord.

CABARRUS, FRANCISCO DE, 1752-1810; a Spanish financier, originator of a bank and company for trade with the Philippine islands. He was one of the council of finance under Charles III., and proposed many reforms. Under Charles IV. he was accused of embezzlement and imprisoned, but soon after was released and made a count. Bonaparte made him a minister of finance, in which office he died. His daughter Thérèse, under the name of Mme. Tallien, afterwards princess of Chimay, was conspicuous in the closing days of the French revolution of 1789.

CABATUAN, a city of the province of Iloilo, on the island of Panay, one of the Philippines. It is situated on the banks of the river Tiguin, which so abounds with crocodiles that fishing is unsafe. Navigation is very uncertain, the river being sometimes nearly dry, while at others it overflows its banks, and deluges the surrounding country. The city was founded in 1732, and possesses a population of 23,000, who are chiefly engaged in the production of rice, and of cocoa-nut oil.

CABAZERA, capital of the province of Cagayan, island of Luzon, Philippines. Pop. 15,000. Tobacco is grown very extensively in the province, and its manufacture affords employment to large numbers of people.

CABBAGE, *Brassica oleracea* (see BRASSICA), a plant in most general cultivation for culinary purposes in Europe and other countries, cultivated also to a considerable extent for feeding cattle. It is a native of the rocky shores of Britain and other parts of Europe, more plentiful on the shores of the Mediterranean than in more northern latitudes, and in its wild state is generally from a foot to two feet high. This plant has been cultivated in Europe from time immemorial; it has likewise been cultivated from an early period in gardens and about villages in India. Few plants show so great a tendency to vary in their form through cultivation; and among the varieties of this one species are reckoned several of our most esteemed culinary vegetables, such as kale (q.v.) or greens, borecole, colewort (q.v.), savoy (q.v.), kohlrabi (q.v.), cauliflower (q.v.), and broccoli (q.v.)—plants which differ much in their appearance and in the particular qualities for which they are valuable, both from each other and from the original wild plant.

The wild C. has smooth sea-green leaves, waved and variously indented; the boiling of the leaves, or their forming close heads at a certain stage of the growth of the plant, so that the inner leaves are blanched, is peculiar to those cultivated varieties which commonly receive the name of cabbage.

The ordinary varieties of C. are often called by the general name of *white C.*, to distinguish them from the *red C.*, which is of a deep brownish-red or purplish color, and is chiefly used for pickling, for which purpose it is much esteemed. The *tree C.*, or *cow C.*, is a variety cultivated for cattle, especially in the Channel islands and the n. of France, of which the leaves do not close together into compact heads, but which is remarkable for its great height—reaching, when it is in flower, 10 ft. on rich soils—and for its branching stem. The stems of this kind are sometimes used as stakes for pease, and even as cross-spars for thatched roofs. The *Portugal* or *tranxuda C.*, also known as *couve tronchuda*, is a variety remarkable for its delicacy, and for the large midribs of its leaves, which are often used like sea-kale. It is an article of luxury like cauliflower, and requires a somewhat similar cultivation.—Cabbage-seed is sown either in spring or autumn, and the seedlings transplanted in rows at distances of two feet or upwards, according to the size of the variety. They are often planted closer, and the alternate plants cut young for open greens, for which the sprouts that arise from the stem of some varieties after the head has been cut off are also used. Cabbages require a rich, well-manured soil, and the earth about the roots ought to be often stirred. By sowing and planting at different dates and of different varieties, a succession is secured in the garden; and when winter approaches, part of the principal crop may be taken up and laid in a sloping position, so that only the heads are above the earth, in which way they are generally preserved without injury. In some places, cabbages are completely buried in the earth, the plants not being allowed to touch each other; and this method succeeds well in peaty or sandy soils.

The C., considered as food, contains more than 90 per cent of water, and therefore cannot be very nutritious: 100 parts of the ordinary C. consist of

Extractive.....	2.34

Green fecula.....	0.63
Water and salts.....	93.80

The digestibility of C. varies according as it is partaken of raw or boiled; thus, raw C. alone is digested in 2½ hours; raw C., with vinegar, in 2 hours; and boiled C. takes 4½ hours. Immense quantities of cabbages are used in Germany as *sauer kraut* (q.v.).

CABBAGE BARK. See ANDIRA.

CABBAGE BUTTERFLY, a name common to several species of butterfly, the larvæ of which devour the leaves of cruciferous plants, especially of the cabbage tribe, and are popularly known as cabbage-worms or kale-worms. The large C. B., or large white garden butterfly (*pontia brassicæ*, or *peris brassicæ*), is one of the most common of British butterflies. It is white; the wings tipped and spotted with black. The wings, when expanded, measure from $2\frac{1}{2}$ to 3 in. across. The antennæ terminate in an ovoid club. The female lays her eggs, which are conical and bright yellow, in clusters of 20 or 30, on the leaves of the plants which are the destined food of the caterpillars. The caterpillars, when fully grown, are about 1 in. or $1\frac{1}{2}$ in. long, and are excessively voracious, eating twice their own weight of cabbage-leaf in 24 hours. When full grown, they suspend themselves by their tails, often under ledges of garden-walls, or similar projections, and are metamorphosed into shining pale-green chrysalids, spotted with black, from which the perfect insect emerges, either in the same season or after the lapse of a winter—no longer to devour cabbage leaves, but to subsist delicately upon honey, which it sucks from flowers.—See INSECTS.—The small C. B., or small garden white butterfly, sometimes called the turnip butterfly (*pontia* or *peris rapæ*), very much resembles the large C. B., but the expanse of the wings is only about 2 inches. The eggs are laid singly on the under side of the leaves of cabbages, turnips, etc., and the caterpillars, which are of a velvety appearance, pale green, with a yellow line along the back, and a yellow dotted line on each side, sometimes appear in great numbers, and prove very destructive. They bore into the hearts of cabbages, instead of merely stripping the leaves, like those of the last species, and thus are a greater pest, even when comparatively few. The chrysalis is of a pale reddish-brown color, freckled with black.—A third species, also common in Britain, the green-veined white butterfly (*pontia* or *peris napi*), very nearly resembles the small cabbage butterfly.—The excessive multiplication of these insects is generally prevented by small birds, which devour them and their caterpillars, and by insects of the *ichneumon* (q.v.) tribe, which lay their eggs in the caterpillars, that their own larvæ may feed on them.

CABBAGE FLY, *Anthomyia brassicæ*, a fly of the same family with the house-fly, flesh-fly, etc., and of which the larvæ or maggots often do great injury to the roots of cabbages, and sometimes to those of turnips. It is of the same genus with the fly generally known as the turnip fly (q.v.), and also with the potato fly (q.v.), beet fly (q.v.), etc. It is about one fourth of an inch in length, and half an inch in expanse of wings; of an ash-gray color; the male having a silvery gray face, and a long black streak on the forehead; the female, a silvery-white face, without any black streak; the abdomen of the male is linear, that of the female terminates conically; the eyes of the male nearly meet on the crown, those of the female are distant, with a broad black stripe between them. The larva is very similar to that of the flesh-fly—yellowish white, tapering to the head, which has two black hooks. The pupa is rust-colored and horny.

CABBAGE MOTH, *Mamestra* or *Moctua brassicæ*, a species of moth, the caterpillar of which feeds on cabbage and turnip leaves, and is sometimes very destructive. The caterpillar is greenish-black, and changes to a brown pupa in autumn. The perfect insect is of a rich mottled-brown color, the upper wings clouded and waved with darker brown, and having pale and white spots, a yellowish line near the fringe, the fringe dotted with black and ocher, the under-wings brownish and white.

CABBAGE PALM, or **CABBAGE TREE**, a name given in different countries to different species of palm, the great terminal bud of which—the palm cabbage—is eaten like cabbage. The C. P. of the West Indies is *areca oleracea*. The southern states of America have also their C. P. or cabbage tree, otherwise called the palmetto (*chamærops palmetto*). See **ARECA**, **EUTERPE**, **PALM**, and **PALMETTO**.

CABBALA (from Heb. *kibbel*, to receive), the received doctrine, by which is not to be understood the popularly accepted doctrine, but that inner or mystical interpretation of the law which the Cabbalists allege that Moses received from God in the mount, and subsequently taught to Joshua, who in his turn communicated it to the 70 elders, and which has ever since been the treasure of the select Jews. Since the 12th c., the study of this secret lore has gradually resulted in a distinct school and literature, the elements of which, however, are already visible in the Macedonian epoch, and the real or historical source of which is to be found in the eastern doctrine of emanation. In Philo, in the Talmud, etc., we certainly find theologico-philosophical conceptions, which were at a later period taken up and modified; but the first book on cosmogony is *Jezirah*, a production of the 7th c., attributed to Akiba. After the second half of the 12th c., the Cabbalistic doctrines, which had at first been confined to such high themes as God and creation, began to include exegesis, ethics, and philosophy, and so became a kind of mystical religious philosophy. The numerous Cabbalistic writings composed during the three subsequent centuries, professed to teach the secret or mystical sense of Holy Writ, and the principles on which it is grounded, the higher meaning of the law, as well as the method of performing miracles, by the use of divine names and sacred incantations. The Cabbalists, moreover, prepared books, which they attributed to the oldest authorities—for instance, *Sohar*, a work written in Aramaic during the 13th c., and fathered upon Simeon-ben-Joachai, a scholar of Akiba. This became the Bible of the Cabbalistic

neophytes. The chief opponents of the Cabbalists were the philosophers, and in part the Talmudists. Towards the close of the 16th c., the Cabbalistic wisdom, which by that time had degenerated into magic and word-juggling, received a new impulse from its teachers in Palestine and Italy. Since the time of Reuchlin, many Christian scholars have investigated the subject.

CABEÇA DE VACA. See NUÑEZ ALVAR.

CABELL, a co. in s.w. West Virginia, on the Ohio river at the Chesapeake and Ohio railroad, watered by Guyandotte river. It is hilly but fertile, producing corn, tobacco, etc. Co. seat, Barboursville.

CABEIRI, divinities anciently worshiped in Egypt, Phœnicia, Asia Minor, and Greece. The ancients have left us very obscure notices of the C., and learned men have been unable to reach any satisfactory conclusions with regard to them and their worship. It is certain that the worship had both its mysteries and its orgies, and it appears also that the C. were amongst the inferior divinities, and regarded as dwelling upon the earth, like the Curetes, Corybantes, and Dactyles, and were probably representatives of the powers of nature.

CABENDA, or **KABINDA**, a seaport in Loango, lower Guinea, on the Atlantic, at the mouth of the Livingstone, 5° 30' south. It is one of the few salubrious places on the coast. Pop. 16,000.

CABÈS, or **KHABS**, **GULF OF** (ancient *Syrtis Minor*), an inlet of the Mediterranean sea, lying between the islands of Kerkenna and Jerba, on the n.e. coast of Africa, in lat. about 34° n., and long. from 10° to 11° east. The town of Cabes (ancient *Tucape*) stands at the head of the gulf.

CABET, **ÉTIENNE**, a notable French communist, was b. at Dijon, Jan. 2, 1788, and educated for the bar, but turned his attention to literature and politics. Under the restoration, he was one of the leaders of the Carbonari (q.v.), and in 1831 was elected deputy for the department of Côte d'Or. Soon afterwards, he published a *History of the July Revolution* (1832), started a radical Sunday paper, *Le Populaire* (1833), and, on account of an article in this paper, was sentenced to two years' imprisonment, but escaped to London. Here he wrote brochures against the July government, and began his communistic studies. After the amnesty, 1839, he returned to Paris, and published a *History of the French Revolution* (4 vols., 1840), bestowing great praise on the old Jacobins. He attracted far more notice by his *Voyage en Icarie* (1840), a "philosophical and social romance," describing a communistic Utopia. The work obtained great popularity among the working-classes of Paris. C. next proceeded to turn "his philosophical romance" into a reality, and published (1847) in his journal, *Le Populaire*, the statutes for the formation of an "Icarian colony" on the Red river in Texas; inviting his followers to emigrate. The first division sailed on the 2d Feb., 1848, but a short experience convinced them that Texas was anything but a Utopia. Their complaints reached Europe, but did not deter C. from embarking at the head of a second band of colonists. On his arrival, he learned that the Mormons had just been expelled from Nauvoo, in Illinois, and that their city was left deserted. The Icarians established themselves there in May, 1850. C. now returned to France, to repel the accusations against his probity which had been circulated during his absence, and to obtain a reversal of the judgment which had been formally pronounced against him, 30th Sept., 1849. Having succeeded in this, he went back to Nauvoo, where he governed, as a sort of dictator, his petty colony, until 1856, when he was deprived of his office, and obliged to flee to St. Louis, where he died 9th Dec. of the same year. C. was a shallow thinker, a weak ruler, and a poor writer; but his success, such as it was, is a proof of what can be accomplished by what has been termed, with more vigor than elegance, "pig-headed perseverance."

CABEZA DEL BUEY, a t. of the new province of Badajoz, Spain, about 86 m. e.s.e. of the city of Badajoz. It is situated on the northern slope of the Sierra Pedregosa, has manufactures of woollens and linens, and a trade in cattle and agricultural produce. Pop. 6500.

CABEZA DEL BUEY, a small t. of Spain, in the province of Badajoz, 86 m. e.s.e. of the town of Badajoz, on the n. slope of the Sierra el Pedrose. The town is tolerably well built, and has a number of churches and other public buildings. Pop. 5395, engaged chiefly in the manufacture of woollen and linen cloths. [From *Chambers's Supplement*.]

CABEZON DE LA SAL, a t. of Spain, in the province of Valladolid, about 7 m. n.n.e. of the city of that name. It is situated on the Pisuerga, and is celebrated as the scene of one of the first battles of the peninsular campaign, in which the Spaniards were signally defeated by the French. Pop. 2000.

CABIN is the general name for a room or apartment on shipboard. In ships of war, the living-rooms of the admirals and captains are called "state" cabins, and are fitted up with much elegance, with a gallery or balcony projecting at the stern. The chief officers below the captain have their cabins on either side of the main-deck; while those of the subordinate commissioned officers are, in large ships, on either side of the lower or orlop deck. All the cabins of a ship of war are inclosed by light paneling, which is quickly removable when preparing for action.

CABINET (Ital. *gabinetto*), a small chamber set apart for some special purpose, such as the conservation of works of art, antiquities, specimens of natural objects, models, and the like. From signifying the chamber in which such collections are contained, the term C. has recently come to be employed by us, in imitation of the French, to signify the collections themselves, and this even when they fill many rooms or galleries. It often means simply a small room appended to a larger one, when it is also called an ante-room, a retiring-room, and the like. See CLOSET.—**CABINET PICTURE**, a picture suited for a cabinet or small room. C. pictures are generally small in size, highly finished, and thus suited for close inspection.

CABINET (see **MINISTRY**, *ante*), in political affairs, the heads of departments who are the immediate advisers or counselors of the chief executive. In the United States government the cabinet consists of the secretaries of state, treasury, war, navy, and interior, the attorney-general and the postmaster-general. They meet whenever desired by the president, but not publicly. No minutes are kept of their doings, nor are the names of those present recorded. The president presides; and he may at any time require in writing the opinion of any of the members upon matters concerning his department. But the cabinet has no responsibility, as that rests with the president alone.

CABIRI, or **CABEIRI**, divinities worshipped in Egypt, Phenicia, and other countries, but of which worship or its purpose little is known. The worship was observed yearly and the ceremonies lasted nine days, always in secret, though women and children were admitted. In Lemnos all the fires were extinguished, sacrifice for the dead was offered, and a sacred vessel was sent to Delos to procure new fire, which was distributed among the people, and with its kindling they began a new or regenerated life, free from sin.

CABLE is either a large rope, or a chain of iron links, chiefly employed on shipboard to suspend and retain the anchors. Rope cables are made of the best hemp, twisted into a mass of great compactness and strength. The circumference varies from about 3 in. to 26. A certain number of yarns are twisted to form a *lissum*; three lissums are twisted in an opposite direction to form a *strand*; and three strands are twisted (in the same direction as the yarns in a lissum) to form a *cable*. The number of yarns in a C. of given size is not always alike, because the yarns slightly vary in thickness; but the following is one among many tables which have been prepared relating to cables of 120 fathoms, and of the usual degrees of thickness:

Inches Circumference.	Yarns.	Lbs.
3.....	= 48.....	= 192
6.....	= 174.....	= 696
9.....	= 393.....	= 1572
12.....	= 699.....	= 2796
15.....	= 1093.....	= 4372
18.....	= 1574.....	= 6296
20.....	= 1943.....	= 7772

Some cables are made with four strands, but three is the common number. If a C. be twisted too much, it is stiff; if too little, it is weak. The strength of a C. of 18 in. circumference is found to be about 60 tons; and for other dimensions, the strength varies according to the cube of the diameter. On shipboard, cables receive the names of *chief cables*, *bovier cables*, etc., according to the anchor to which they are attached. During the great war ending in 1815, the largest ships in the British navy carried ten cables, most of which were about 2 ft. or a little more in circumference. Although ships seldom anchor at a greater depth than 40 fathoms, it is not deemed safe to trust the anchor to one C. of the usual length; two are spliced together at the ends. The hempen cables now made are generally 101 fathoms; but 100 fathoms in practical seamanship denotes "a cable's length," and is really the length of a chain cable.

CHAIN CABLES are made of links, the length of each of which is generally about six diameters of the iron of which it is made, and the breadth about three and a half diameters. In government contracts, chain cables are required to be made in 12½ fathoms lengths, with one swivel in the middle of every alternate length, and one joining-shackle in each length. The stay-pins, to strengthen the links, are of cast iron. The bar or rod from which each link is made, has the two ends cut diagonally; it is bent into the form of a nearly complete oval ring; and then the two ends are joined and welded, the stay-pin being at the same time introduced at the proper place. Besides the ordinary links, there are end-links, joining-shackles, splicing-tails, mooring-swivels, and bending-swivels. The sizes of chain cables are denoted by the thickness of the rod-iron selected for the links. The following table gives certain ascertained quantities concerning the cables in ordinary use:

Thickness of Iron.	Weight of Stay-pin.	Weight per Fathom.	Breaking Strain.
½ inch.	½ oz.	13½ lbs.	6 tons.
1 "	3½ "	54 "	24 "
1½ "	12 "	121 "	60 "
2 "	28 "	215 "	99 "
2½ "	40 "	272 "	126 "

By the chain cables act of 1871, certain bodies are licensed to erect machines for testing all chain cables and anchors; and it is forbidden to sell or purchase, under a penalty of £50, any chain cable or any anchor weighing more than 168 lbs., which has not been duly tested. Minor alterations were introduced by a later act (1874), leaving the main rules intact.

CABLE-MOLDING, in architecture, is a molding cut in the form of a rope, the twisting being prominently shown. It was much used in the later Norman style.

CABLING, the molding by which the hollow parts in the flutes of columns and pilasters in classical architecture are often partially filled. The C. seldom extends beyond the third part of the shaft from the ground.

CABOCHED, or **CABOSSED**, an heraldic term, from the old French word *caboche*, the head. When the head of an animal is borne, without any part of the neck, and exhibited full in face, it is said to be caboched.

CABOCHIENS, certain butchers of Paris, named from their chief Jean Caboche, who were partisans of John of Burgundy against the Armagnacs. In 1418, their outrages provoked the people of Paris to rise against them.

CABOOSE, or **CAMBOOSE** (Danish, *kabyse*, a cook's room in a ship; Ger. *kabuse*, a little room), is the name of the kitchen or cook-room in a merchant-ship. In coasting-vessels, the term is applied to a portable cast-iron stove on the deck, where food is cooked.

CABOT, the name of two Venetians, father and son, both celebrated as navigators and discoverers.—**GIOVANNI CABOT**, or **CABOTTO**, the father, whose business compelled him to reside much in Bristol, was appointed by Henry VII., Mar. 5. 1496, to the command of a squadron of five vessels on a voyage of discovery in the Atlantic ocean. In this expedition he was accompanied by his sons Ludovico, Sebastiano (born at Bristol, 1477), and Sanzio. On the 24th of June, 1497, the coast of Labrador, North America, was sighted. The merit of this discovery has been generally ascribed to the navigator's second son, Sebastian C., the most scientific of the family; but an extract from a chart preserved by Hakluyt mentions the father before the son. The expedition returned in Aug., 1497. In 1498, a second was made, with what results we do not know; and in 1499, a third to the gulf of Mexico. About this time, Giovanni, the father, appears to have died, and we hear no more of *Sebastian* till 1512, when he entered the service of Ferdinand, king of Spain. During the year 1515, he was engaged in revising maps and charts in connection with his profession, and in planning an exploration of the n.w. passage to Asia, which, however, was laid aside on account of the death of Ferdinand in 1516. C., who seems to have been no favorite with the Spanish courtiers, was now subjected to a series of contemptible insults. This usage induced him to return to England, and in 1517, he was appointed by Henry VIII. to the command of an expedition to Labrador. He reached lat. 67½° n., and entered Hudson's bay, where he gave names to several places; but the expedition proved on the whole a failure, on account of the cowardice or malice of his vice-commandant, sir Thomas Perté. C. now entered again into the Spanish service, was made pilot-major of the kingdom by Charles V., and commanded an expedition which examined the coast of Brazil and La Plata, which he attempted to colonize. In 1531, he returned to Spain, and resumed his old situation; but in 1548, he once more betook himself to England, where he was well received by king Edward VI., who made him inspector of the navy, and gave him a pension. To this monarch he seems to have explained the variation of the magnetic needle in several places, which he was among the first, if not the very first, to notice particularly. In 1553, C. was the prime mover and director of the expedition of merchant adventurers which opened to England an important commerce with Russia. It is not known exactly when C. died.—*Memoir of Sebastian Cabot* (Lond. 1831).

CABOT, GEORGE, 1751–1823; b. Mass.; in early life a ship captain, but in 1776 chosen to the Massachusetts provincial congress. He was also in the state constitutional convention, and in 1789 was chosen U. S. senator. He was offered but declined the position of secretary of the navy. His last political act was to preside over the Hartford convention.

CABOTVILLE. See **CHICOPEE**, *ante*.

CABOTZ. See **CUSO**.

CABRA (ancient *Egabrum*), a t. of Spain, in the province of Cordova, 30 m. s.e. of the city of that name. C. is irregularly built between two hills, and surrounded with gardens; vineyards in the neighborhood produce excellent wine. It is chiefly agricultural; but it has manufactures of woolen, linen, hats, soap, earthenware, etc. Pop. 12,000.

CABRAL, FRANCISCO, 1528–1609; a Portuguese Jesuit missionary at Goa, and superintendent of the mission schools in India. He also labored in Japan with success, and had the supervision of missions in China. He was for nearly 40 years at the head of the Roman Catholic school in Goa.

CABRAL, or **CABRERA, PEDRO ALVAREZ**, the discoverer of Brazil, was descended from an old and patrician Portuguese family. Nothing is known of his early life, save the fact, that he must have recommended himself by talent and enterprise to king Emanuel

of Portugal, who, after the first voyage of Vasco de Gama, appointed C. to the command of a fleet of 13 vessels, carrying 1200 men, and bound for the East Indies. On the 9th Mar., 1500, he sailed from Lisbon. To avoid the inconvenience of being becalmed on the coast of Africa, he took a course too far westerly, fell into the South American current of the Atlantic, and was carried to the unknown coast of Brazil, of which he claimed possession for the king of Portugal, April 24, 1500, naming the new country "Terra da Santa Cruz." After sending home one vessel to bear news of this great accidental discovery, C. sailed for India; but on the 29th of May, four of his vessels foundered, and all on board perished, including Diaz, the great navigator; and soon afterwards three more vessels were lost. C. therefore landed at Mozambique, on the e. coast of Africa, of which he first gave clear information, and also discovered (Aug. 23) the Antschedives islands, of which he described correctly the position. Hence he sailed to *Cabicut*, where, having made the terror of his arms felt, he was permitted to found a factory; entered into successful negotiations with native rulers, and thus established the first commercial treaty between Portugal and India. He returned from India, bringing with him a considerable booty, and arrived in the port of Lisbon, July 31, 1501. It appears probable that the king was dissatisfied with the results of the expedition (although it had annexed Brazil to the crown of Portugal), for subsequently we find no mention made of C. among other discoverers. At the request of C., Sancho de Toar wrote a description of the coast of Sofola. C.'s voyages are described in Ramusio's *Navigazione e Viaggi*, 3 vols. (Venice, 1563; new ed., Venice, 1835).

CABRE RA, a small island in the Mediterranean, lying off the southern point of Majorca. It is about 3 m. in length and breadth, with an irregular coast, and is little else than a barren calcareous rock. The only interest attached to C. is, that during the war in the Peninsula it formed a Spanish depot for French prisoners, who were crowded in thousands into the desolate spot, and treated with great barbarity; of which an account is given in a popular work, entitled the *Adventures of a French Sergeant*.

CABRE RA, DON RAMON, the boldest leader of the Carlist party in Spain, was b. at Tortosa, in Catalonia, 31st Aug., 1810. The death of Ferdinand, in 1833, gave the signal for a civil war, and first brought C. into notice. Placing himself at the head of some guerilla troops, he joined the absolutists, or partisans of Don Carlos, and by his vigilance, energy, and daring soon rose to be second in command in the Maestrazgo district. Throughout Aragon and Valencia his name became a by-word for cruelty. After penetrating as far s. as Andalusia, his forces were completely routed by the royal troops, on the borders of Aragon, and he himself, severely wounded, escaped with difficulty into the woods. It was now rumored that C. was dead, when all at once he reappeared at the head of 10,000 foot and 1600 horse. Invading the province of Valencia, he overthrew the royal army at Buñol, 18th Feb., 1837, and again on the 19th Mar. at Burjasot; but was in his turn vanquished at Torre Blanca, and once more compelled to seek a hiding-place. Shortly after, he reopened the war with fiery energy. Madrid itself was threatened by C., who, about this time, received the title of count of Morella for his vigorous defense of the fortress of that name, and was also appointed governor-general of Aragon, Valencia, and Murcia. The Carlists now believed that the triumph of absolutism was approaching, when the treachery of the Carlist gen., Marotto, changed the whole aspect of affairs, and Don Carlos fled from Spain. C. held out until Espartero forced him to quit the country in the summer of 1840. He then entered France, where he was taken prisoner, and confined for a short time in the fortress of Ham. In 1845, he strongly opposed Don Carlos's abdication of his rights. On the outbreak of the French revolution in 1848, he renewed the struggle on behalf of absolutism in Spain; but the adventure proved a miserable failure, and on the 17th Jan., 1849, he recrossed the Pyrenees, to live in retirement. He afterwards married a wealthy English lady, Miss Marianne Catherine Richards. When Alphonso was proclaimed king of Spain in 1875, C. advised the Carlists to submit to him, chiefly because he was "a good son of the church." He died 24th May, 1877.

CABUL', a river in Afghanistan, rises in lat. 34° 21' n., and long. 68° 20' e., on the southern declivities of the Hindu Kush or Indian Caucasus. Its source is 8400 ft. above the level of the sea; and an eastward run of 320 m., with a fall of about 7500 ft., along n. Afghanistan, through the Khyber mountains, and across Peshawur, carries it into the Indus, opposite to Attock, in the Punjab. The point of confluence marks the head of navigation on the main stream, while the tributary itself is practicable about 50 m. upwards for craft of 40 or 50 tons. By means, therefore, of the two taken as one line, there exists an available communication of about 1000 m. between the Khyber mountains and the Indian ocean. The C. washes the cities of Cabul, Jelalabad, and Dobundee.

CABUL' is the name given to that part of Afghanistan (q.v.) which lies s. of the Hindu Kush, and is drained by the Cabul river. It extends from the s. of Ghiznee to the Hindu Kush, and from Bamian (q.v.) to the Khyber pass. This region has long occupied a prominent position in the world. Through it, as the passage from Persia to India, Alexander the great marched to complete his eastern conquests; from it issued Mahmoud of Ghiznee, the first Mohammedan invader of Hindustan.

The city of Cabul, from which the surrounding territory takes its name, has 60,000

inhabitants, and stands in lat. $34^{\circ} 30'$ n., and long. $69^{\circ} 6'$ e., near the point where the river, here crossed by three bridges, ceases to be fordable. Elevated about 6400 ft., and overtopped, within a short distance to the n., by pinnacles of the Hindu Kush, about 14,000 ft. higher than itself, C. has a severe winter, and a temperate summer, ranging from 75° to 85° F. The city was formerly surrounded with an earthen wall, which no longer exists. It is separated into different quarters, for defense, by stone walls—the Bala Hissar, or citadel proper, being on the e., and the Kuzzilbashas or Persians having a strongly fortified quarter on the s.w. In the days of sultan Baber, C. was the capital of the Mogul empire. In more recent times, it has witnessed some of the most momentous events in Anglo-Indian history. In 1839, it was taken by the British; in 1841, it was lost through a treacherous outbreak, which led (6th Jan., 1842) to the massacre of about 4000 soldiers and 12,000 followers; and, finally, after being recovered by gen. Pollock in the same year, it was abandoned, its bazaars and public buildings having previously been burned to the ground.

After the death of Dost Mohammed, ameer of Afghanistan, Shere Ali, the son whom he had selected as his heir, had to fight for the possession of C. with Uzful Khan, his elder brother, and the son of the latter, Abdulrahman, who had married a daughter of the khan of Bokhara. Shere Ali was at first unsuccessful. On May 21, 1866, Uzful entered C. in triumph, and was proclaimed ameer of Afghanistan. He applied to sir John Lawrence, the Indian viceroy, to recognize him, but the request was declined on the ground that Shere Ali remained in possession of a large part of Afghanistan. At the death of Uzful, his brother Azim took the title of ameer, not of Afghanistan, but of C. and Candahar. In the end of 1868, Shere Ali, aided by his son Yakoob, obtained possession of C., which became again the capital of Afghanistan. At the close of the war of 1878-79, Yakoob, ameer of Afghanistan, agreed that there should be an English resident at Cabul.

CACA'O. See COCOA.

CACCA' MO, a t. in the province of Palermo, Sicily, about 6 m. s.w. of Termini, with a pop. of 7200.

CA' CERES, a t. of Spain, capital of the new province of Caceres, is situated on a river of the same name, about 25 m. w. of Truxillo, in a rich agricultural district. It is famous for its bacon; has manufactures of linen, woolens, leather, hats, soap, etc.; dye-works and flour-mills, and a large trade in the produce of the district. It is the *Castra Caecilia* of the Romans, and many relics of its antiquity are still found. It is rich in architecture of the feudal period, and has one of the largest and finest bull-rings in Spain. Pop. 14,000.

CA' CERES, NUE'VA, a t. of the Philippines, in the province of South Camarines, on the island of Luzon. It is situated on the river Naga, or Santa Cruz, between the bay of San Miguel and the gulf of Ragay, about 175 m. s.e. of Manila. Pop. 12,000.

CACHA'O, capital of the province of Tonquin, and the largest city in the kingdom of Anam (q.v.), having an estimated population of 100,000. It stands about 100 m. from the sea, on the Tonquin river, which is thus far navigable for small-craft. It has a considerable trade, sufficient to have at one time attracted English and Dutch factories. The exports are bullion, silks, and lacquered ware; and the imports are pepper, arms, long cloths, chintzes, and manufactured goods generally. The port is open to all nations.

CACHAR', or HAIRUM'BO, a district of British India, since 1874 included in the chief commissionerhip of Assam, between 24° to 26° n. lat., and 92° to $93^{\circ} 30'$ e. long. With an area of 1285 sq.m., it contained, in 1871, 205,027 inhabitants. It is mostly mountainous and uncultivated. Its principal river is the Barak, which, after a singularly tortuous course of 350 m., enters the Brahmaputra about 40 m. above Dacca. The territory produces rice, cotton, tea, sugar, timber, bamboo, iron ore, wax, and ivory; and imports salt, cloths, tobacco, and ghee or half liquid butter.

CACHE (Fr. a lurking-hole), the name given by parties of travelers in the great western prairies of the United States to places for concealing provisions and other articles. Designing to return on their tracks after crossing the Rocky mountains, they disburden themselves of what articles can be spared, and, to conceal them from the Indians, construct places of deposit in the wilderness. The making of a C. is a matter of much labor and ingenuity. A hole is dug to a depth of perhaps 6 or 8 ft. and several feet broad, and then the articles being interred, the surface is replaced with the utmost possible care. The excavated earth is also carefully removed, so as to leave no trace whatever of the excavation. The situation of the C., however, is known to the party by some landmark, and returning months afterwards, they probably find its contents undisturbed.

CACHE (a hiding-place), usually a cavity, natural or artificial, in the ground or among rocks, where voyagers and explorers stow provisions or records, to be found by themselves or others. If containing provisions, the cache needs to be very strong to resist the depredations of animals.

CACHE, a co. in n.e. Utah, on the Idaho frontier, watered by Bear river; 700 sq. m.; pop. '70, 8229; in '80, 12,686. Productions agricultural. Co. seat, Logan.

CACHEO, or CACHEU, a t. in Senegambia, w. Africa, in the land of the Papels, a few miles from the mouth of San Domingo or Cacho river; pop. 15,000. It is a Portuguese fortified post, and has trade in ivory and gold dust.

CACHET, LETTRES DE. See LETTRES DE CACHET.

CACHEXIA, a name applied by physicians sometimes to a group of diseases, and sometimes to the constitutional state accompanying a particular disease—e.g., cancerous C., gouty C., mercurial cachexia. The word is derived from the Greek *kakos*, bad, and *hexis*, a habit, and signifies simply a *bad habit of body*, without reference to the cause of illness. From Cullen's having in modern times given extensive circulation to the word, as indicating a large group of chronic diseases, in most of which there are complicated changes in the blood and in the solid textures, C. has come to be chiefly employed with reference to diseases in which the general nutrition of the body is at fault, and in which the local disorders are supposed to be the result of a constitutional cause. Thus, cancerous C. indicates the peculiar impoverished state of the blood and general debility which are associated with the deposits of cancer in various parts of the body; gouty C., the state of the general system in gout, as opposed to the mere local attack of gout in the foot, etc. The cachexiæ differ from the fevers in being much slower in development, and, for the most part, in having no natural termination at a fixed period. See CRISIS.

CACHICAMA, or TATOU-PEBA, *Dasypus novem-cinctus*, an armadillo in tropical America, covered with horny plates. It is about 1½ ft. long, harmless, and easily tamed. Its food is ants and other insects.

CACHOEIRA, or CAXOEIRA, a t. in Brazil, in the province of Bahia, and 62 m. n.w. of the city of Bahia; pop. 15,000. It has a town-house, a prison, a Carmelite convent, and several churches. Its trade is in tobacco, coffee, and sugar.

CA CHOLONG, a beautiful mineral, regarded as a variety of opal (q.v.). It is sometimes called pearl opal, or mother-of-pearl opal. It is generally of a milk-white color, rarely with a yellowish or reddish tinge, opaque and dull or pearly and shining, and has a flat conchoidal fracture. Among the localities in which C. is found are the Giants' Causeway and the Farøe islands.

CACHOLOTT, CACHALOTT, SPERMACETI WHALE, or SPERM WHALE, *Physeter macrocephalus* or *catodon macrocephalus*, one of the largest of the cetacea (q.v.), very peculiar in form and appearance, much sought after not only on account of the oil, but still more on account of the spermaceti (q.v.) which it yields. Ambergris (q.v.) is also obtained from it. The C. belongs to the family of cetacea called *physeteridae*, or *catodontidae*, of which some naturalists still think that there is only one well-ascertained species. There appears, however, to be pretty good reason for thinking that at least two species exist, both of which are occasional visitants of the British shores—the common C., having no dorsal fin, and the high-finned C. (*physeter tursio*) having a very high dorsal fin. The common C. has a very wide geographical range. It may almost be said to inhabit all seas, although it is most abundant in those of the southern hemisphere. It is not of frequent occurrence on the European shores, although it sometimes enters the Mediterranean, and is occasionally stranded on the coasts of Britain. An individual, 54 ft. long and 30 in circumference, ran ashore on Cramond island, in the firth of Forth, in 1769, and was very particularly described in the *Philosophical Transactions* by Mr. Robertson of Edinburgh. Twelve were caught at Walderwich, on the Suffolk coast, in 1788. The C. sometimes reaches the length of 70 or 80 feet. The head is enormously large, forming about one half of the entire bulk of the animal, and occupying more than one third of the entire length. From the head, the body tapers to the tail, and at last rather rapidly. The general color is very dark gray, nearly black on the upper parts, lighter beneath. Old males, or, in the language of the South Sea whalers, old bull whales, usually have a large gray spot on the front of the head. The muzzle is very obtuse, almost as if suddenly cut off in front, the breadth of it almost equaling the thickness of the body. In a protuberance on the upper part of it, is the blow-hole, which is single, situated a little on the left side, and in form not unlike the letter S elongated. The mouth is very large and wide; and the throat, unlike that of the Greenland whale, is very wide, sufficiently so to admit the body of a man. The upper jaw projects some feet beyond the lower, and is destitute both of teeth and whalebone; the lower jaw has from 20 to 25 teeth on each side, according to the age of the animal. The teeth are conical and slightly recurved, projecting about 2 in. from the gum. The lower jaw is extremely narrow, the two branches being in contact throughout the greater part of its length: it fits into a groove in the upper, in which are cavities for the teeth. The eyes are small, and placed far back in the head, above the angles of the mouth; the left eye is said to be smaller than the right. Just above the eyes, the dorsal line rises considerably; the dorsal fin is also represented by a protuberance about half-way between the neck and the tail; and these parts are seen above water in the ordinary swimming of the animal, which is at the rate of from 3 to 7 m. an hour, and just under the surface of the water, although when alarmed it swims with greater velocity, strik-

ing the water upward and downward with its tail with great force. The pectoral fins are small, and seem scarcely if at all to aid in progression, which is accomplished by the large and powerful tail-fin. The tail-fin is very broad, and is divided into two lobes, called by South Sea whalers *the flukes*.

The enormous head of the C. is in great part occupied by a cavity in front of and above the skull, called by whalers *the case*, which is a receptacle for spermaceti (q.v.). This substance being light, it is not wonderful that the animal in swimming raises its head above the surface of the water, which it also often does even when at rest, "like a black rock in the ocean." The *case* frequently holds as much as ten large barrels of spermaceti. It is not formed of bone, but of a strong tendinous integument, and is divided into compartments communicating with each other. The substance which it contains is in a semi-fluid state, but hardens on cooling; it consists of spermaceti and oil; the oil is separated by draining and squeezing, and the spermaceti further purified, till, instead of being a yellow unctuous mass, in which state it is brought home by the whalers, it assumes a beautiful pearly white, flaky, almost crystalline appearance. When the spermaceti whale is killed, and towed alongside the whaling-ship, the *case* is emptied of its valuable contents through a hole made in front of the muzzle, and by means of a bucket attached to a pole. The spermaceti was at one time imagined to be the brain of the whale; what purpose it serves in the animal economy, is not well known, except that already alluded to of giving buoyancy to the forepart of the huge body; and perhaps this is its chief use, respiration even more than progression depending on it; but it is distinct enough from the brain, which is comparatively very small, and is indeed, as well as the skull which contains it, small in proportion to the whole bulk of the creature. Cavities filled with spermaceti are distributed over the body, and even ramify through the external fat or blubber, although the principal mass is in the head. The blubber of the C. is not nearly equal in thickness to that of the Greenland whale, being only about 14 in. thick on the breast of a large whale, and from 8 to 11 in. on other parts of the body. It is called by whalers *the blanket*, is removed from the body of the captured whale in great strips, and is heated in large pots, the skin of the whale serving for fuel, when the oil known as sperm oil (q.v.) flows from it. The *junk*, a thick elastic mass, which occupies the forepart of the head, immediately under the *case*, yields also a considerable quantity of sperm oil.

The C. feeds upon fishes and cephalopodous mollusks. Squids and cuttle-fishes appear to be its chief food. It is gregarious in its habits, and the herds are called *schools* by whalers. Five hundred or more have been seen in a single herd. Large herds generally consist of females, with only a few males; herds of young males also occur; when solitary individuals are met with, they are almost always old males. Terrible conflicts often take place among the males, and it is not unusual to find the lower jaw deformed in consequence of having been dislocated or broken in them. See WHALE-FISHERY.

CACIQUE, or CAZIQUE', the designation given to the chiefs of Indian tribes in works relating to the central and southern parts of America. The word was derived by the Spaniards from the language of the former inhabitants of St. Domingo.

CACODÆMON. See DEMON.

CACODYLE, or KA'KODYLE, is an organic substance containing carbon, hydrogen, and arsenic (C₄H₆As). It has been proposed to employ the oxide of C. (C₄H₆AsO) as a deadly agent in war. This compound, otherwise known as *Cadet's fuming liquor* or *alkarsine*, has the remarkable property of taking fire spontaneously when exposed to the air, and evolving abundant fumes of arsenic. Thus, a shell filled with it would, on bursting, saturate a space of ground, or the rigging or deck of a man-of-war, with a liquid which would quickly take fire of its own accord, and besides causing destruction by burning, would likewise spread death by its fumes.

CACONGO, or MALLEM'BA, an independent state of s. Guinea, Africa, extending along the s. Atlantic ocean, in lat. 5° s., and stretching s.e. as far as the river Bell. Its limits interiorly are not well defined. The country is generally flat, and the soil fertile. The principal towns are Kinguele, and Cacongo and Mallemba on the coast, the last once a great mart for slaves.

CACTEÆ, or CACTA'CEÆ, a natural order of exogenous plants, consisting of succulent shrubs of very singular appearance. Linnæus included all the C. in the single genus *cactus*, which is now divided into a number of genera; the name *cactus*, however, still continuing in popular use, common to the whole order. Nearly 500 species are known, but the real number is probably much greater. The C. are, without exception, natives of America, and their extraordinary forms constitute a remarkable feature in the vegetation of its warmer regions. All of them have fleshy stems, either simple or branched, often very soft and juicy; but in many, at least when old, having an easily distinguished woody axis, composed of annual rings, and covered with a layer of inner bark, so that the thick fleshy part may be regarded only as a layer of bark. Most of them are leafless; the *pereskia* alone have true leaves, which are fleshy; and the *opuntia* have rudimentary leaves, which soon fall off; but, instead of leaves, most of the order have clusters of hairs or prickles, where buds are formed in their stems, and these are

very numerous, even in the species which in ordinary circumstances most rarely develop branches. The multiplicity of curious forms exceeds imagination; in many species (*melocactideæ*, or melon thistles), the stem swells out into a globe; in others (*torch thistles*), it rises up as a column with many angles; in others (*opuntia*, Indian figs, or prickly pears), it divides in leaf-like articulations; in some (*pereskia*) it assumes a tree-like form, in which the thick stem bears a head of branches, and reaches a considerable height, sometimes even 30 or 40 feet. Those which have angular, ribbed, and channeled, or flat and two-edged stems, show a tendency to the cylindrical form as the stem advances in age. Some species have long creeping or trailing stems. The whole organization of the C. adapts them for the endurance of long droughts; they vegetate vigorously during a part of the year, and then rest; the very absence of leaves concurring with the absence of pores or *stomata* in their tough skin to enable them to resist the action of a dry atmosphere and powerful sunshine, and to occupy arid soils and bare rocks, on which they are very generally found, often covering large tracts. Some of them grow rapidly on old lavas, and disintegrate them by their penetrating roots, thus preparing a soil for other plants; and the prickly pear is often planted in Sicily by the mere insertion of a branch or joint of it in a fissure of lava. Many species occur as *epiphytes* (q.v.) on the trees of American forests. Some also grow on high mountains, a few even reaching almost to the border of the snow. The plants of this order are a great boon to the regions in which they chiefly abound, which are, at least during great part of the year, very destitute of water; their stems containing a store of insipid and wholesome juice, of which both men and cattle avail themselves.—Some species, as the prickly pear (q.v.), produce a pleasant fruit.—The fruit of *opuntia tuna* affords a valuable pigment of the richest carmine color.

The flowers of the C. are in general very short-lived; those of some night-flowering species, as of *cereus grandiflorus*, well known in our hothouses, endure only for part of a single night. In the greater number, they are large and splendidly colored, in some they are very fragrant. The order is regarded as botanically allied to *mesembryaceæ* (q.v.) and to *grossulariaceæ* (q.v., gooseberry, currant, etc.).

The cultivation of the C. in green houses and hothouses has been much in fashion for more than 30 years. The gardener must imitate the natural conditions of their growth, by giving water freely during a few months, and withholding it almost entirely during the rest of the year. Most of them are easily propagated by branches, taken off, and allowed to dry a little before being planted. The *melocactideæ*, which do not readily produce branches, are made to do so by cutting off or burning out the central bud, that the means of propagating them may be obtained.

CACTUS. See CACTEÆ, *ante*.

CACUS, in legend, a gigantic son of Vulcan, who dwelt in a cave on mount Aventine and continually vomited fire and smoke. He stole cattle from the people and drew them backward into his cave, so that their tracks would not point to his abode. He was slain by Hercules for stealing the cattle of Geryon.

CADAM'BA, or KUDUMBA, the wood of several species of *nauclea*, a genus of trees of the natural order *cinchonaceæ*, natives of the East Indies, having flowers with a funnel-shaped corolla. *N. cadamba* is a noble tree, with orange-colored fragrant flowers, collected in heads about the size of a small apple. The leaves are from 6 to 10 in. long. The wood is yellow, soft, and fine-grained. The tree is highly prized for the shade which it affords; the wood is used for various purposes. *N. cordifolia* is a large tree, plentiful in mountainous districts of Hindustan; the wood yellow, close-grained, and used for flooring-planks, packing-boxes, and many other purposes, as is also that of *N. parviflora*. All kinds of C. wood are, however, liable to be injured by moisture, and can only be used where they are to be kept dry.

CADA MOSTO, LUIGI DA, a Venetian navigator of the 15th c., who, with others, in 1455, explored the w. coast of Africa as far south as the river Gambia. He wrote an account of his voyages in the *Book of the First Voyage over the Ocean to the Land of Negroes in Lower Ethiopia*.

CADASTRAL SURVEY is one which represents objects in their true relative positions and dimensions, as they exist on the face of the country, differing thus from a topographical survey, which, for distinctness, enlarges certain objects, as the dimensions of houses, width of roads, streams, etc. The usual scale of a map of C. S. is about 2 ft. to a mile.

CAD'DICE, or CAD'DICE-FLY (*phryganea*), a Linnæan genus of insects of the order *neuroptera*, a family in subsequent entomological systems, and constituted by Mr. Kirby into a distinct order, *trichoptera* (Gr. hairy-winged). The caddice-flies certainly differ in important particulars from the other neuropterous insects, and exhibit points of resemblance to the *lepidoptera*. They have no mandibles, and the maxillæ and lower lip are membranous and united; the head is small, with prominent eyes, and two additional small simple eyes situated on the forehead; the antennæ are long and bristle-like, composed of very numerous indistinct joints. Both wings and body are generally very hairy, and the wings, when at rest, are raised, and meet above the back like those of butterflies, from which, however, they differ very much in form, being much more

elongate: the legs are long. Caddice-flies are extremely active, particularly in the evening and at night, when the smaller species often fly in great numbers above streams and ponds. These insects are most interesting, however, on account of their larvæ, of which the larger kinds are the well-known *caddice-worms*, or *cad-bait* of anglers. They are of a long, almost cylindrical form, the head and first three segments hard, the remainder—the abdominal segments—soft. To the thoracic segments are attached the feet, six in number, as in the perfect insect. The larva lives always in water, feeding on aquatic vegetables. It spins by its mouth silken threads, by means of which, together with a viscid substance, it attaches together—and often in a very symmetrical manner, and with interesting peculiarities which differ in the different species—small hard substances, such as small stones, bits of stick, or small shells, even although they happen to contain living inmates, and thus constructs a case for itself, in which its soft body is protected, and from which only the head and hard thoracic segments are voluntarily protruded. When it changes into the pupa state, in which it differs little from the perfect insect, except in the imperfectly developed wings, it fixes its case to some solid substance beneath the water, and closes the two extremities with a kind of grating, which admits the free passage of water, necessary for respiration. Before assuming the perfect form, the pupa of the larger species breaks out of its case by means of a pair of hooks on the forepart of the head, and swims actively by means of the hind legs, or crawls by the other two pair. Many of the smaller species bring their pupa case to the surface of the water, and there take wing from it as from a boat. The species of caddice-fly are very numerous, and they are said to be more so in the n. than in the s. of Europe. About 200 British species have been described.—The angler looks for cad-bait about the edges of streams and under stones, or on the stalks of water-creases, and other aquatic plants. As a bait for angling, the caddice is almost as deadly as the May-fly, and more so, in clear running streams, than the ordinary worm; the usual-sized bait-hook is used, upon which two of the baits are fixed, the angler proceeding exactly as in ordinary worm-fishing.

CADDO, a parish in n.w. Louisiana, bordering on Arkansas and Texas; 1200 sq.m.; pop. '70, 21,714—15,799 colored. Productions, corn, cotton, sweet potatoes, etc. The Texas Pacific railroad passes through the parish. Principal town, Shreveport.

CADDOES, or **CADODAKUOS**, Indians in or near Texas on the upper Red river and lake Caddo. There are but a few hundreds left of a once large tribe.

CADE, JACK, a historical character, leader of an insurrection which broke out in Kent, June, 1450. Little is known of his personal history, further than that he was an Irishman, and an illegitimate relation of the duke of York, and hence called himself Mortimer. With 15,000 or 20,000 armed men of Kent, C. marched on London, and encamped at Blackheath, whence he kept up a correspondence with the citizens, many of whom were favorable to his enterprise. The court sent to inquire why the good men of Kent had left their homes; C., in a paper entitled "The Complaint of the Commons of Kent," replied that the people were robbed of their goods for the king's use; that mean and corrupt persons, who plundered and oppressed the commons, filled the high offices at court; that it was "noised that the king's lands in France had been aliened;" that misgovernment had banished justice and prosperity from the land; and that the men of Kent were especially ill-treated and overtaxed, and that the free election of knights of their shire had been hindered. In another paper, called "The Requests by the Captain of the Great Assembly in Kent," C. demanded that the king should resume the grants of the crown, which he complained the creatures about the royal person fattened on, the king thus being compelled to live on taxation; that the false progeny of the duke of Suffolk should be dismissed; and that the duke of York and others should be restored to favor, and a number of persons punished. The court sent its answer in the form of an army, before which C. retreated to Sevenoaks, where he awaited the attack of a detachment, which he defeated. The royal army now objected to fight against their countrymen; the court made some concessions, and C. entered London on the 3d July. For two days, he maintained the strictest order; but he forced the mayor and judges to pass judgment upon lord Say, one of the king's hated favorites, whose head C.'s men immediately cut off in Cheapside. On the third day, some houses were plundered, the leader himself, it is said, setting the example. C., who at night lodged his army in the borough, got news that the citizens intended to prevent his entrance into the city on the morrow, and in the night he made an attack on the bridge, but was defeated. A promise of pardon now sowed dissension among his followers, who dispersed, and a price was set upon C.'s head. He attempted to reach the Sussex coast, but was followed by an esquire, named Alexander Iden, who fought and killed him, July 11. His head was stuck upon London bridge, as a terror to traitors.

CADELLE, *trogosita mauritanica* or *caraboides*, an insect sometimes found in granaries in Britain, but seemingly imported from more southerly countries, where, as in France, its larvæ often commit great ravages among stored corn. They also live on bread, almonds, and even rotten wood. When full grown, they are about $\frac{1}{4}$ of an in. long, flattened, fleshy, rough with scattered hairs, whitish, tapering towards the head; which is black, horny, and furnished with two curved jaws. The perfect insect is a glossy beetle of a deep chestnut color, marked with dotted lines. It belongs to the

family of *xylophagi*, of the order of *coleoptera* (q.v.), section *tetramera*. The name C. is French.

CADENCE, in music, is the finish of a phrase (in German, *schlussfall*), of which there are three principal species—viz., the whole, the half, and the interrupted cadence. The whole C., which finishes on the harmony of the tonic, is also called the perfect C., and is always used at the end of a composition, and frequently called the final cadence. In its most perfect use, it consists of three chords—the one before the final being always the dominant. as for example:

The half C., also called the imperfect C., is used to mark the termination of an idea or phrase, like the colon and semicolon; showing a considerable division, but at the same time that a continuation is necessary. The harmony of the half C. is the reverse of the whole C., as it falls from the tonic to the dominant, and sometimes to the sub-dominant as follows:

In the interrupted C. (Ger. *trugschluss*; Ital. *cadenza d'inganno*), the preparation for the ordinary perfect C. is made; but instead of the harmony of the tonic following the dominant, another harmony quite strange is introduced, so that the ear is deceived. The more particular the preparation for the usual C. is made, the more strange and unexpected is the interruption, which can be made in so many ways that Reicha, in his *Traité de Haute Composition Musicale*, gives 129 interrupted cadences. The following are those generally in use:

CADENCY (from Lat. *cado*, to fall or decline). The marks by which the shields of the younger members of families are distinguished from those of the elder, and from each other, is an extensive, and, in so far as that term can be applied to heraldry at all, an important branch of the science. No distinction is usually made by writers on heraldry, and probably the practice of heralds in general scarcely admits of any being made, between *marks of C.*, *differences*, *distinctions*, or even *brisures*, though the last term is pretty constantly and quite appropriately used to include not only differences in general, but also abatements (q.v.) or bearings by which the arms of the family are broken or diminished. See **BASTARD BAR**. But there is a manifest convenience in the practice which is usually followed in Scotland, of appropriating the label, the crescent, the mullet, and the rest of the series of marks, commonly known as marks of C., to the purpose of distinguishing the sons from the father, and from each other, during the father's life-time; and of adopting other distinctions—such as the bordure of various kinds, the chief engrailed, embattled, and the like, as differences between the coats of brothers, after the death of their father, and of the houses descended from them. Another very common mode of differencing the shields of brothers in early times, was by changing the tinctures; but this is now regarded as too extensive a change for such a purpose.

The differences at present used by the royal family will be found in most of the peerages. The rule with regard to them seems to be that, unlike subjects, they all bear the label of three points argent; but the label of the prince of Wales is plain, whilst those of the other princes and princesses are charged with crosses, fleurs-de-lis, hearts, or other figures, for the sake of distinction. One of the most frequent reasons for matriculating the arms of the younger branches of families of distinction in the lord Lyon's register, is that they may be properly distinguished from those borne by the head of the house.

CAZENZA, in music, an ornamental succession of notes introduced at pleasure by the performer at the finishing of a phrase.

CADER IDRIS (chair of Idris, a reputed giant), a picturesque mountain in Merionethshire, Wales, 5 m. s. w. of Dolgelly. It consists of an immense ridge of broken precipices, 10 m. long, and 1 to 3 m. broad; the highest peak reaching an elevation of 2914 feet. It is composed of basalt, porphyry, and other trap rocks, with beds of slag and pumice. The view from the summit, which is very extensive, includes the Wrekin in Shropshire, and St. George's channel almost to the Irish coast.

CADET (*ante*). All students at the United States military academy and naval academy have this title; and there are also medical cadets recognized as a distinct rank.

CADET, MILITARY (Fr. *cadet*, younger, junior in service—aliied in derivation and meaning to cadency (q. v.) in heraldry), is a term applied in a general sense to a junior member of a noble family as distinguished from the eldest; and in France, any officer junior to another is a C. in respect to him. In a strict military sense, however, a C. is a youth studying for the public service.

In England, military cadetship has presented two aspects, according as it is related to the East India company's or to the royal service. When the company possessed political and military authority in India, there were about 5000 English officers in their pay. Those who commanded the company's own regiments had been professionally educated by the company. A youth, nominated by the directors, was examined as to his proficiency in an ordinary English education, and admitted between the ages of 14 and 18 to Addiscombe school or college, near Croydon. If a probation of 6 months resulted satisfactorily, he entered upon a two years' course of study. If he passed through this ordeal well, he became a C. in the company's service, receiving pay or salary, and being available for service in India, as opportunity might offer. The system of Indian cadetship underwent various modifications by the introduction of competition in the appointments, and by the transference of the company's powers to the crown; and ceased in 1861, when the accession of fresh officers to the local Indian armies was stopped.

The second aspect of military cadetship in England, adverted to above, is that of the royal or queen's cadets. The arrangements in operation until recently will be found noticed under SANDHURST COLLEGE; and the present arrangements are given under STAFF COLLEGE, and MILITARY ACADEMY, ROYAL.

CADET, NAVAL, is the lowest grade of officer in the royal navy. The cadets enter the royal service at 12 to 13½ years of age. Every captain, on being appointed to a ship in commission, is allowed to nominate one C.; every flag-officer (admiral, etc.), two, on hoisting his flag; each member of the board of admiralty, four; the two secretaries, two each; and all the rest are nominated by the first lord of the admiralty. The candidates are examined at the royal naval college at Greenwich; if they pass, they are sent for two years to the *Britannia* training-ship at Dartmouth, which is virtually a public school, for tuition, in which the C.'s parent or guardian pays £70 a year. If they do not progress sufficiently in the training-ship, they are rejected; but if the report is favorable, they are put into sea-going ships. While on board, the C. is expected to watch and learn as much as possible of what is going on—saluting officers, tying knots, splicing ropes, arranging rigging, learning technical terms, going aloft, keeping the log, keeping watch, etc. If he pass from the *Britannia* with a first-class certificate, he becomes a midshipman at once; otherwise, according to the progress he makes. Cadets mess with the midshipmen on shipboard. There were 191 cadets on the navy estimates for 1878-79, receiving each a shilling a day as pay or pocket-money.

CADETS' COLLEGE. A college with this designation was established in 1858 by a remodeling of the junior department of the royal military college at Sandhurst. Its objects were, to give a sound military education to youths intended for the army, and to facilitate the obtaining of commissions when the education was finished. The age of admission was between 16 and 19. The friends of a youth, able to pay the sums of money presently to be named, applied to the commander-in-chief for permission to place the youth on the list of candidates; this permission was usually granted on production of satisfactory certificates and references. The youth might go up for examination on any half-year. The list of subjects included English composition, continental languages, mathematics, history, geography, natural sciences, experimental sciences, and drawing. After the examination, the candidates were reported to the commander-in-chief in their order of merit. Those who had the most marks were admitted as cadets as soon as vacancies occurred in the college. When entered, they studied for two years on a great variety of subjects connected with military science and practice. The friend supplied clothing, books, and instruments. The annual payment for education, board, and lodging varied from £100 per annum down to £20; the highest sum being demanded for "the sons of private gentlemen," while the lowest was deemed sufficient for "the sons of officers of the army or navy who had died in the service, and whose families were proved to be left in pecuniary distress." Twenty of the youths were "queen's cadets," sons of officers "who had fallen in action, or had died from the effects of active service, and had left their families in reduced circumstances." These 20 cadets were

admitted and educated gratuitously. This system was abolished in 1870. Sub-lieutenants of cavalry and infantry, styled "student officers," who have done duty with a regiment for about 12 months, are now required to attend the college at Sandhurst, and go through a course of study for a year. At the end of it, on passing a satisfactory examination, they are promoted to the rank of lieutenant, and rejoin their regiments. See also MILITARY ACADEMY, ROYAL.

CADNET'S FUMING LIQUOR. See CACODYLE.

CADI, an Arabic word signifying a judge or person learned in the law, the title of an inferior judge amongst the Mohammedan nations, who, like the Mollah (q. v.), or superior judge, must be chosen from the higher ranks of the priesthood, as all law is founded upon the Koran.

CADILLAC, ANTOINE DE LA MOTHE, d. 1719; a French pioneer and officer in America, who came to Nova Scotia in 1691; commanded at Michilimackinac, 1691-97, and in 1701 founded Detroit. He was governor of Louisiana, 1712-17, where he had much trouble with the Indians.

CADIZ, a province in s. Spain, in the ancient division of Andalusia; bounded n. by Seville, e. by the Mediterranean, s. by the straits of Gibraltar, and w. by the Guadalquivir; 2806 sq. m.; pop. '70, 426,499. It is a mountainous region, traversed by the Sierra Nevada, and but partially cultivated. The wines of the province are especially fine. The western part is traversed by the Seville and Cadiz railroad.

CADIZ (ancient *Gades*), an important commercial city of Spain, capital of the modern province of the same name, which forms a part of the great division of Andalusia; is situated at the extremity of the long narrow isthmus of the isle of Leon, in lat. 36° 32' n., and long. 6° 17' west. The Atlantic ocean washes its western and part of its southern side, and on the n. and n.e. it is inclosed by the bay of Cadiz, a deep inlet of the Atlantic, forming an outer and an inner bay. Connected by only a narrow strip of ground (in some places not above 200 yds. across) with the mainland, C. is admirably situated for defense; but though it has several sea and land fortifications, these are by no means considered impregnable. The town, which is surrounded by walls, forms nearly a square, each side being about a mile and a half in length. The houses being built of white stone, the city presents a remarkably bright and clean appearance from the sea. The streets are well paved and lighted, regular, but narrow, and there are some pleasant public walks, the most frequented of which is the Alameda. It has few public buildings of note; its two cathedrals are, on the whole, but poor specimens of ecclesiastical architecture, and its pictures, with the exception of one or two excellent pieces by Murillo, are of little value. C. declined greatly as a commercial city after the emancipation of the Spanish colonies in South America; but owing partly to the recent extension of the railway system in Spain, and partly to the establishment of some new lines of steamers, the trade has, within the last thirty years, revived considerably. Quite lately again there has been serious depression. In 1873, the total imports of C. were valued at £2,100,729; in 1876, at £1,908,166; in 1873, the exports were worth £3,941,095; and in 1876, only £1,908,166. The number of Spanish ships which entered C. in 1874 was 2677, with a tonnage of 315,333; of foreign ships, 962—tonnage, 300,730. The exports consist of wine, olive-oil, fruits, salt, and metals. The manufactures are glass, woolen cloth, soap, hats, leather, etc. Pop. '79, 68,000.

C. is one of the most ancient towns in Europe, having been built by the Phenicians, under the name of Gaddir, 347 years before the foundation of Rome, or about 1100 B.C. It afterwards passed into the hands of the Carthaginians, from whom it was captured by the Romans, who named it Gades, and under them it soon became a city of vast wealth and importance. Occupied afterwards by the Goths and Moors, it was taken by the Spaniards in 1362. In 1587, Drake destroyed the Spanish fleet in the bay; nine years later, it was pillaged and burned by lord Essex; and in 1625 and 1702, it was unsuccessfully attacked by other English forces. After the revolution of 1808, C. became the headquarters of the insurrectionary junta, by whose orders it was separated from the mainland. The French, in Feb. 1810, commenced a blockade, which they vigorously persevered in, capturing several of the forts, until Aug. 25, 1812, when the victories of the duke of Wellington forced them to abandon it. The city was besieged and taken by the French in 1823, and held by them until 1828. In the Spanish revolution of 1868, C. played a distinguished part.

CADMIUM is the term applied to the crust formed in zinc furnaces, and which contains from 10 to 20 per cent of cadmium.

CADMIUM is a metal which occurs in zinc ores, and, being more volatile than zinc, rises in vapor, and distils over with the first portions of the metal. See ZINC. C. is represented by the symbol Cd, has the atomic weight 56—new system, 112—and the specific gravity 8.6. It is a white metal, somewhat resembling tin; is malleable and ductile; fuses at 442° F., and rises in vapor a little above 600°. It is rarely prepared pure, and is not employed in the arts as a metal, though one or more of its salts have been serviceable in medicine. The sulphide of C., CdS, occurs naturally as the mineral *greenockite*, and when prepared artificially, is of a bright yellow color. It is known as cadmium yellow, and is of great value to the artist. A great variety of tints are pro-

duced by mixing it with white-lead. Much of what is sold as Naples yellow (q. v.) is thus prepared; but the genuine Naples yellow has a greenish tint, which renders it easily distinguishable from the imitation. Cadmium yellow, however, has many valuable qualities, which are causing it rapidly to supersede Naples yellow.

CADMUS (according to Apollodorus and others) was the son of Agenor and Telephassa, and the brother of Europa. When the latter was carried off by Zeus, he and his brothers, as also their mother, were sent in quest of her, with injunctions from Agenor not to return without her. Their search was vain, and the oracle at Delphi told C. to relinquish it, and to follow a cow of a certain kind which he should meet, and build a city where it should lie down. He found the cow in Phocis, followed her to Bœotia, and built there the city of Thebes, about 1550 B. C. The myth of C., however, like other early Greek myths, abounds in contradictions, and it is wholly impossible to disentangle the historical facts from the meshes of fable in which they are imprisoned. To him is ascribed the introduction into Greece of an alphabet of 16 letters, derived from Egypt or Phœnicia, and the discovery of brass, or introduction of its use.

CADOUAL, GEORGE, a distinguished leader in the Chouan or royalist war in Brittany, was b. near Auray, in lower Brittany, where his father was a miller, in 1771. He was among the first to take up arms against the republic, and soon acquired great influence over the peasants. Captured in 1794, he was sent as a prisoner to Brest, from which he soon made his escape, imprisonment having only increased his loyal ardor. Annoyed at the dissensions between the Vendean generals and the emigrant officers, and the disasters consequent thereon, C. organized an army in which no noble was permitted to command, and which Hoche, with all his great military talents, was unable to subdue or disperse. In 1799, C. was the soul of the conspiracy to overthrow the first consul, and place a Bourbon on the throne; but the events of the 18th Brumaire disarranged the plans of the conspirators. Bonaparte recognized C.'s energy and force of character, and offered to make him a lieutenant in his army, which offer C. refused, as well as another of a pension of 100,000 francs, if he would only consent to remain quiet. Bonaparte attempted to arrest him, but he fled to England, where, in 1802, he conspired with Pichegru for the overthrow of the first consul. With this design he went to Paris, but was arrested, condemned, and executed June 25, 1804. C. was a man of stern honesty and indomitable resolution. "His mind was cast in the true mold; in my hands he would have done great things," was Napoleon's estimate of him.

CADUCEUS, the winged staff of Mercury, or Hermes, as he was called by the Greeks, which was supposed to give the god power to fly. The C. in the actual world was the staff or mace carried by heralds and ambassadors, from which circumstance, no doubt, it came to form one of the attributes of the messenger of the gods. Originally, it was simply an olive-branch, the stems of which were afterwards formed into snakes, in accordance with several poetical tales invented by the mythologists. One of these was to the effect that Mercury, having found two snakes fighting, divided them with his rod, and that thus they came to be used as an emblem of peace. Many miraculous virtues were ascribed to the caduceus. On the coinage of antiquity, the C. is often given to Mars, who holds it in the left hand, a spear being in his right, to show how peace and war alternate. It is also seen in the hands of Hercules, Bacchus, Ceres, Venus, etc. Amongst the moderns, the C. is used as an emblem of commerce, over which Mercury was the presiding divinity.

CADWALADER, GEORGE, b. Penn.; bred to the law; served as brig.gen. in the Mexican war and maj.gen. of volunteers in the war against the rebellion.

CADWALADER, or CADWALLADER, JOHN, 1743-86; b. Penn.; a member of the Pennsylvania convention of 1775, and brig.gen. in the revolutionary war, participating in the engagements at Brandywine, Germantown, Monmouth, and Trenton. After peace he was a member of the Maryland assembly.

CÆCILIA (Lat. *cæcus*, blind), a genus of reptiles, formerly placed among serpents, on account of their form, although, in their anatomical structure, peculiarities were observed allying them to batrachians, with which they are now ranked, the important fact having been ascertained of their breathing by gills when young, and undergoing a metamorphosis. The body is almost cylindrical or worm-like, the head small, the eyes very small, and nearly hidden by the skin; in some species, indeed, imperfect or wanting, upon which account the name C. was given to them, and an attempt has been made to transfer to them the English name blindworm, commonly given to the *anguis fragilis*. The skin is smooth, viscous, and annularly wrinkled, appearing naked, although, upon dissection, minute scales are found disposed between its wrinkles, at least in some species. The vertebræ are articulated as in fishes and in some of the other lower batrachians, not as in serpents, and the skull is united to the first vertebra by two tubercles. The ribs are imperfectly developed, and much too short to encircle the trunk.—The original genus C. has been subdivided, now forming a family, *cæciliidæ*. The species are inhabitants of warm climates, and of marshy or moist places.

CÆCILIUS STATIUS, d. 168 B. C.; a Roman comic poet and dramatist, of whose works few fragments remain. The people ranked him with Plautus and Terence, as among the first of comic writers.

CÆCUM (Lat. *cæcus*, blind), a blind sac; that is, a sac or bag having only one opening, connected with the intestine of an animal. In man there is only one C., very small, and apparently not performing any important function, situated at the extremity of the small intestine, where it terminates in the large intestine or colon. In many of the mammalia, however, and particularly in most of those which are herbivorous, it is comparatively large, and is found to secrete an acid fluid resembling the gastric juice. It therefore appears that, where the nature of the assimilatory process is such as to require the detention of the food for a considerable time, this provision is made for it, in order that digestion may be more completely accomplished. The C. is entirely wanting in some quadrupeds, as in bats, and the bear and weasel families. Birds have two cæca, which are generally long and capacious in those that are omnivorous or granivorous, and the position of which is the only circumstance that marks the division of the intestine into two parts, the small and the large intestine, or the *ileum* and the *colon*. In reptiles, a C. is of very rare occurrence. Fishes have none in the position occupied by those of quadrupeds and birds, but many of them have cæca attached to the intestine at its uppermost part, and very generally regarded as appendages of the stomach. The number of these cæca is, however, extremely various; sometimes there are only 2, and sometimes more than 100. The number is different even in very nearly allied species of the same family; thus, there are only 6 in the smelt, but 70 in the salmon; 24 in the herring, and 80 in the shad. In some fishes, as the cod, the cæca consists of large trunks ramified into smaller ones.—The intestinal canal of some of the *infusoria* is furnished throughout its whole length with numerous cæca, no other organ corresponding to a stomach appearing to exist.

CÆDMON, the first Anglo-Saxon writer of note who composed in his own language, and of whom there are any remains. The date of his birth is unknown, but his death occurred about 680 A.D. He was originally a cowherd attached to the monastery of Whitby, and, according to Bede, "even more ignorant than the majority of his fellows, so that in the evenings, when the domestics assembled in the hall to recreate themselves with music after the labors of the day, C. was frequently obliged to retire in order to hide his shame when the harp was moved towards him." One night, however, as he was sleeping in the stable loft, a stranger appeared to him, and commanded him to sing. C. declared his ignorance, but the stranger would take no refusal, and imposed on the poor cowherd the sublime task of hymning the glories of creation. Suddenly a poetic inspiration seized him, and he began to pour forth verses. When he awoke from his dream the words remained fast-rooted in his memory, and were recited by him to others with new confidence. The abbess Hilda, and the learned men who were with her in the monastery, immediately declared that he had received the gift of song from heaven. He was now educated, became a monk, and spent the rest of his life in composing poems on the Bible histories and on miscellaneous religious subjects, many of which have been preserved, and are altogether in bulk nearly equal to the half of *Paradise Lost*. To parts of which some of them bear a striking resemblance. Satan's speech in hell is characterized by a simple yet solemn greatness of imagination, which may possibly have influenced at some period of his life the more magnificent genius of Milton.

CÆLATURA. See CHASING.

CÆLIUS AURELIANUS, a physician of Numidia in the latter days of the Roman empire, and author of a valuable medical work. He divided disease into two great classes, acute and chronic, devoting his work of ten books to their elucidation.

CÆLIUS MONS, one of the seven hills of Rome. See *ROME*, *ante*.

CAEN, the chief t. in the department of Calvados, France—formerly the capital of lower Normandy—is situated on the left bank of the Orne, about 9 m. from its mouth, 122 m. w.n.w. of Paris. C. is built in the middle of a fertile plain; its streets are wide and clean, it has several fine squares, and many noble specimens of ancient Norman architecture. Among the best examples are the churches of St. Etienne, founded by William the conqueror, and which contained his monument, erected by William Rufus, and destroyed by the Huguenots in 1562; La Trinité, called also *Abbaye aux Dames*, founded by Matilda, wife of the conqueror; St. Nicholas, now a cavalry fodder-store; St. Pierre and St. Jean. The castle, founded by the conqueror, and finished by Henry I. of England, was partially destroyed in 1793. There are several beautiful promenades in the city, which has manufactures of lace, blonde, crape, cutlery, cotton-yarn; breweries, dye-works, wax-bleaching, and ship-building yards. Its Angora gloves, made from the unwashed, undyed fur of Angora rabbits, which are reared in the district, are celebrated. Quarries in the neighborhood produce an excellent stone, called Caen stone (q.v.). Trade is facilitated by a maritime canal connecting the port with the sea, and also by the railway connecting it with the Paris and Rouen line; those to Cherbourg, Tours, and Honfleur, and that to Flers, opened in 1867, which affords C. communication with Granville. Nothing is known of C. before the 9th century. It was a place of importance in 912, when it came into the possession of the Normans, under whom it increased rapidly. William the conqueror and his queen made it their residence, and greatly improved it. In 1346, it was taken and pillaged by the English, who again captured it in 1417. It was held by them until 1450, when the French compelled them to surrender.

During the revolution of 1793, several of the Girondist chiefs, proscribed by the Jacobins, went to C., and organized a revolt against the Mountain, which proved unsuccessful. Pop. '76, 33,072.

CAEN STONE. The neighborhood of the t. of Caen, in Normandy, has been celebrated for its stone quarries from a very early period. The excellence of the stone, and the facility of transport by sea, led to C. S. being very extensively used in England in the 15th and 16th centuries. In 1460, the abbot of Westminster obtained a license to import C. S. for the repairs of the monastery. Later, it became a regular article of importation, and in 1582 it is rated at the custom-house at 6s. 8d. the ton. Winchester and Canterbury cathedrals, Henry VII.'s chapel at Westminster, and many country churches, are built of C. S., which is still frequently used in England. The stone is an oolite, resembling Stonesfield slate, but without its slaty structure. The quarries are subterraneous, and the stone is brought up through vertical shafts in blocks 8 or 9 ft. long, and about 2 thick.

CÆRE. See CERVETERÉ, *ante*.

CAERLEON (Castle of the Legion), a small but ancient t. in Monmouthshire, on the right bank of the Usk, 2 m. n.e. of Newport. It is the Isea Silurum of the Romans, and is supposed to have been the capital of the Roman province Britannia Secunda, now Wales, and the residence of the famous king Arthur. It was the seat of an ancient archbishopric, which was removed to St. Davids about 519 A.D. An abbey of Cistercian monks existed here before the reformation. C. was an important place in the 12th c., but it was afterwards ruined by the frequent wars between the Welsh and Anglo-Saxons. Many Roman relics have been found here, as aqueducts, baths, pavements, altars, tiles, coins, inscriptions, and statues; many of the smaller antiquities are deposited in a museum in the town; besides half-melted ore and cinders, and the remains of a fortress, with walls 12 ft. thick and 1800 yards long, and of an amphitheater, called king Arthur's round table, 222 by 192 ft. in size. Pop. '71, 1306. The chief occupation is the manufacture of tin-plates.

CAERMARTHEN (Welsh, *Caer Fyrrdyn*, the *Maridunum* of Ptolemy), a seaport t., capital of Caermarthenshire, South Wales, on the right bank of the Towy, 9 m. from Caermarthen bay. It lies in a picturesque situation, but the streets are irregular, steep, and often narrow. The Towy is navigable for vessels of 200 tons up to the town, and salmon and sewin are caught in the river. There are tin and iron works near the town. C. exports tin-plates, cast iron, timber, marble, bark, slates, lead ore, bricks, grain, butter, and eggs. The Welsh language is used in most of the churches. C. is a co. borough, having a separate jurisdiction from the shire. It unites with Llanelly in returning one member to parliament. Pop. '71, 10,488. There is a college for Welsh teachers. Near C. are the remains of two Roman camps. In the 5th c., Merlin, the Welsh prophet, is said to have been born here. It was long the residence of the native princes of South Wales. Caermarthen castle often changed hands in the contests of the Welsh chiefs with each other, and in the subsequent wars with the Saxons and Normans.

CAERMARTHENSIRE, a maritime co. in South Wales, on the Bristol channel; bounded n. by Cardigan, from which it is separated by the Teify; e. by Brecknock; s. by Glamorgan and Caermarthen bay; and w. by Pembroke. It is the largest of the Welsh counties; length, 53 m.; greatest breadth, 33 m.; area, 974 sq.m., nearly a third of which is waste. The county is mountainous in the n. and e., and is characterized by productive though narrow valleys and deep, wooded glens. Caermarthen Van or Beacon rises to the height of 2596 ft., being the greatest elevation in the county. The coast of C. is marshy, and is all situated on Caermarthen bay, which washes also small portions of the coasts of Glamorgan and Pembroke, is 17 m. across, 10 m. deep, 35 in circuit, and receives the rivers Taff or Tave, Towy, and Lhoughor. The chief rivers of C. are the Towy, Cothy, Taff, and Teify. The Towy has a course of 60 m., of which 50 are in Caermarthenshire. It yields plenty of salmon, sewin, trout, eels, and lamprey, and is navigable for the last 9 m. of its course. On this river is the celebrated vale of the Towy, 30 m. long, with an average breadth of 2 miles. C., n. and w. of the Towy, comprising three fourths of the county, consists of lower Silurian clay-slate and grauwacke. In the s.e. corner of the county is a band of carboniferous limestone and grit, to which succeeds a small part of the South Welsh coal-field of Glamorgan and Monmouth, chiefly composed of stone-coal and culm. The mineral productions of the county are iron, coal, copper, lead, slates, lime, dark-blue marble. These, with tinned iron, grain, cattle, horses, sheep, and butter, are exported. The climate of C. is mild, but moist; the soil is stiff and poor in the uplands, affording pasturage for small cattle; but the rest of the county is well wooded, and in the s. part along the rivers very fertile. Oats and barley are the chief crops. The chief towns are Caermarthen (the county town), Llanelly, Llandelilo-vawr, Llandovery, Newcastle-in-Emlyn, and Kidwelly. The chief manufactures are woollens and hides. Pop. '71, 115,710. C. sends two members to parliament. The county contains so-called Druidical remains and Roman roads, besides many baronial and ecclesiastical ruins. In this county originated the "Rebecca" riots, which in South Wales, in 1843-44, were directed against the turnpike-gates.

CAERNARVON (*Caer-yn-ar-Fon*, Fort opposite Mon or Anglesea), a parliamentary and municipal borough and seaport in North Wales, the capital of Caernarvonshire, situated near the s. end of the Menai strait, on the right bank of the Seiont, 245 m. n.w. of London. C. has a castle situated at the w. end of the town, the building of which was commenced by Edward I. in 1284. It is one of the noblest ruins in the kingdom, the walls being still entire, and inclosing an oblong of three acres. The walls are 7 to 9 ft. thick, and are pierced by a covered gallery, with loop-holes to discharge arrows. There are thirteen embattled towers, with five, six, or eight sides, and surmounted by turrets. The gateway under the great square tower has four portcullises. The town itself was once surrounded by walls and round towers. These walls, with several of the gates, still exist, but are now within the town. The streets are narrow, but regular, and at right angles to each other. In the churches and chapels, the services are in Welsh and English. C. unites with Pwllheli, Nevin, Criccieth, Conway, and Bangor in returning one member to parliament. In 1876, 939 vessels, with a burden of 73,275 tons, entered, and 1900 vessels, with a burden of 144,584 tons, cleared the port, chiefly small-craft and steamers to and from Liverpool. The harbor admits of ships of 400 tons. The chief exports are copper ore, coal, and slates. There is also a great iron and brass foundry. C. is a bathing place, and is much frequented by tourists, on account of its vicinity to the grandest scenery in North Wales. Many families of the upper ranks reside in and around the town. Pop. '71, 9449. Half a mile from C. are the remains, covering seven acres, of Segontium, or Caer Seiont, a Roman station or city. Gold, silver, and copper coins and ornaments, and other Roman relics, have been found here. There is a Roman fort on the left bank of the Seiont, still almost complete, with walls 11 ft. high, and 6 ft. thick, and with parallel rows of holes 3 in. in diameter. C. was the seat of the native princes of North Wales down to 873. In 1284 was born here the first Anglo-Norman prince of Wales, afterwards the unhappy Edward II. In 1294, the town and castle were burned, and the English inhabitants massacred by the Welsh under Madoc, the illegitimate son of Llewelyn, a native prince of Wales. From a rocky height near Uxbridge hotel, there is a fine view of Snowdon and the island of Anglesea.

CAERNARVONSHIRE, a maritime co. in North Wales, bounded n. by the Irish sea; e. by Denbigh, with the Conway between; s. by Merioneth and Cardigan bay; and w. by Caernarvon bay and the Menai strait, the latter separating it from Anglesea. It is 51 m. long; greatest breadth, 22 m.; average, 9; area, 544 sq. m., of which $\frac{1}{2}$ is in pasture, and only $\frac{1}{3}$ th in tillage. The surface is mountainous, and is traversed by the grandest and highest ranges in South Britain, and it is the highest and most mountainous county in North Wales. The Snowdonian or chief range runs through the middle of the greatest length of the county, from s.w. to n.e., and is very bold and rocky. It attains the greatest elevation in Snowdon (q.v.), 3571 ft., in the center of the county, and the highest mountain in South Britain. Caernarvon bay is 30 m. across, 15 long, with 2 to 30 fathoms water, and communicates with the Irish sea through the Menai strait, which is 17 m. long, and $\frac{1}{2}$ to 4 m. broad. The rivers of C. are numerous, but small, from the nearness of all parts of the county to the sea. The Conway, navigable for 10 m., which runs along the e. border, is the chief. Almost all the streams flow through small lakes or tarns—of which there are 50 or 60 in the county—around the central or Snowdonian group of mountains. There are many fine cataracts on these streams. The mineral products of C. are copper, lead, zinc, coal, roofing and writing slates, slabs, chimneys, honestone. The slate quarries employ many thousands of workmen. The climate is mild in the peninsular part of C., but severe among the hills. The chief branch of rural industry in C. is the rearing of black cattle for the dairy, and of small sheep. Wheat, oats, barley, and potatoes are raised in the valleys. Pop. '71, 106,121. The chief towns are Caernarvon (the county town), Bangor, Pwllheli, Conway, Nevin, and Criccieth. In addition to the above boroughs, several flourishing towns have recently sprung into existence in the county—Llandudno, Tremadoc, and Bethesda being the principal. It returns two members to parliament—one for the county, and one for the six chief towns. Connected with C. is the Chester and Holyhead railway, on the great route from London to Dublin, which crosses into Anglesea by the Britannia tubular bridge over the Menai strait. C. contains the remains of British or Celtic camps and hill-forts, especially around Snowdon, several dolmens and stone circles, and some ancient castles. The Snowdonian mountains were long the stronghold of the Welsh against the Romans, Saxons, and Normans in their efforts to subjugate Wales, and here the Welsh were at last defeated in 1283 by Edward I.

CESALPINIA, a genus of trees of the natural order *leguminosæ* (q.v.), the type of the sub-order *cesalpinieæ*. This sub-order is characterized by irregular flowers, which are not papilionaceous (q.v.), and contains upwards of 700 known species, among which many are notable for their purgative properties, as senna (q.v.); some produce eatable fruits, as the tamarind (q.v.), the carob (q.v.), and the West Indian locust tree (q.v.); some yield resinous and balsamic products, as copaiva (q.v.), aloes-wood (q.v.), etc.; some produce important dye-woods, as logwood (q.v.), Brazil wood (q.v.), camwood (q.v.), etc.; and some are trees of great size, and very valuable for their timber, as the purple-heart (q.v.) and the wallaba (q.v.), trees of Guiana. No species of the sub-order

is British, and it generally belongs to warm climates.—The genus *C.* contains a number of species, trees with pinnate or bipinnate leaves, natives of the warm parts of Asia and America, which yield the Brazil wood, Pernambuco wood (see BRAZIL WOOD), and sappan wood (q.v.) of commerce, also the astringent pods called *dividivi* (q.v.), used in tanning.

CÆSALPINUS, or **CESALPINO**, **ANDREAS**, 1519–1603; an Italian philosopher of whose family or descendants nothing is known. He first appears as professor of botany in the university of Pisa, where he seems to have studied, and perhaps taught, anatomy and medicine. In his first work, *Speculum Artis Medicæ Hippocraticæ*, he left proof, in a passage often quoted, that he had a clear idea of the circulation of the blood, at least through the lungs. In botany he was more original, and his works are highly philosophical and valuable, being a rich mine from which Linnaeus, Morrison, and others took their ideas of botanical arrangement. He died in Rome in attendance upon pope Clement VIII.

CÆSAR, the name of a patrician family of the *Julia Gens*, one of the oldest in the Roman state, claiming to be descended from Iulus, the son of Æneas. When or from what cause the surname of *C.* was first acquired, is in the highest degree uncertain. Spartianus, in his *Life of Ælius Verus*, mentions four different opinions respecting its origin: 1. That the word signified an elephant in the language of the Moors, and was given as a surname to one of the Julii because he had killed an elephant; 2. That it was given to him because had been cut (*casus*) out of his mother's womb after her death; 3. Because he had been born with a great quantity of hair (*casaries*); or, 4. Because he had azure-colored eyes (*caesi*). The opinion to which we most incline is the third of these, but who was the original "shock-head" of the gens we cannot say; the first, however, mentioned in history is Sex. Julius Cæsar, prætor in 208 B.C. The greatest individual of the family, and one of the greatest men the world has ever seen, was

CÆSAR, **CAIUS** (or rather **GAIUS**) **JULIUS**, son of a Roman prætor of the same name, was b. 12th July, 100 B.C. Two circumstances conspired to determine his sympathies in favor of democracy, and against a republican oligarchy: the first was the marriage of his aunt Julia with Caius Marius; the second, the marriage of *C.* himself, in 83 B.C., with Cornelia, daughter of L. Cinna, one of the principal enemies of Sulla. The anger of the dictator at this cost *C.* his rank, property, and almost his life itself. Feeling that he would be safer abroad for a time, he went to Asia, 81 B.C.; but on learning of the death of Sulla (78 B.C.), he hurried back to Rome, where he found the popular party in a state of great ferment, and anxious to regain what it had lost under the vigorous despotism of the aristocratic dictator. *C.*, however, took no part in the attempts of Lepidus to overthrow the oligarchy; but he showed his political leanings by prosecuting (77 B.C.) Cn. Dolabella—a great partisan of Sulla—for extortion in his province of Macedonia. To improve his eloquence, he went to Rhodes to study under the rhetor Apollonius Molo. In 74 B.C., he returned to Rome, where he had been elected pontifex, and now for the first time threw himself earnestly into public life. In the year 70 B.C., he attached himself to Pompey, whose political actions at this time were of a decidedly democratic character. In 68 B.C., *C.* obtained a questorship in Spain. On his return to Rome (67 B.C.), he married Pompeia, a relative of Pompey, with whom he was daily becoming more intimate. In 66 B.C., he was elected to the curule ædileship, and lavished vast sums of money on games and public buildings, by which he increased his already great popularity. For the next few years, *C.* is found steadily skirmishing on the popular side. In 63 B.C., he was elected pontifex maximus, and shortly after, prætor. During the same year occurred the famous debate on the Catiline conspiracy, in which the aristocratic party vainly endeavored to persuade the consul, Cicero, to include *C.* in the list of conspirators. In 62 B.C., Pompey returned from the east, and disbanded his army. Next year, *C.* obtained the province of *Hispania Ulterior*. His career in Spain was brilliant and decisive. On his return, he was elected consul, along with M. Calpurnius Bibulus. Shortly before the passing of the agrarian law (59 B.C.), *C.*, with rare tact and sagacity, had reconciled the two most powerful men in Rome, who were then at variance, Pompey and Crassus, and had formed an alliance with them, known in history as the *First Triumvirate*. Both of these distinguished men aided *C.* in carrying his agrarian law; and to strengthen still further the union which had been formed, *C.* gave Pompey his daughter, Julia, in marriage, though she had been promised to M. Brutus; while he himself also married Calpurnia, daughter of L. Piso, his successor in the consulship. On the expiry of his term of office, he obtained for himself, by the popular vote, the province of *Gallia Cisalpina* and *Illyricum* for five years, to which the senate added—to prevent the popular assembly from doing so—the province of *Gallia Transalpina*. Nothing could have been more favorable for *C.*'s aims. He had now an opportunity of developing his extraordinary military genius, and of gathering round him an army of veterans, whom perpetual victory should inspire with thorough soldierly fidelity and devotion to his person. This was the very thing he wanted to give him a reputation equal to that of his coadjutors, Pompey and Crassus, whom, in genius, he far surpassed. Leaving, therefore, the political factions at Rome to exhaust themselves in petty strifes, *C.*, in 58 B.C., after the banishment of Cicero, repaired to his provinces, and during the next nine years conducted those splendid campaigns in Gaul, by which, had he done

nothing else, he would have "built himself an everlasting name." C.'s first campaign was against the Helvetii, whom he totally defeated near Bibracte (Autun). Out of 368,000 only 110,000 remained. These were commanded by C. to return home and cultivate their lands. The eyes of the Gauls were now turned upon the new conqueror. His help was solicited, among others, by Divitiacus, an Æduan chief. This involved C. in a second war with a German prince, named Ariovistus, who was utterly overthrown; and now C., having in the course of one campaign successfully concluded two important wars, led his troops into winter quarters.

Next year (57 b.c.) occurred the Belgic war, in which C. successively routed the Sussions, Bellovaci, Ambiani, and Nervii, who, alarmed at the progress of the Roman arms, had entered into an alliance with each other against the invaders. When the senate received C.'s official dispatches, it decreed a thanksgiving of 15 days—an honor never previously granted to any other general. During the winter and the spring following, C. stayed at Lucca; and, after spending large sums of money in hospitality, and in other less praiseworthy purposes, he departed for Gaul, where the flames of war had burst out in the north-west. The Veneti, a maritime people of Brittany, were the chief instigators of the insurrection. C.'s plans were laid with consummate skill, and were crowned with the most splendid success. The Veneti were totally defeated, and most of the other Gallic tribes were either checked or subdued. C. wintered in the country of the Aulerci and Lexovii (Normandy), having, in the course of three campaigns, conquered Gaul. Next year (55 b.c.), Crassus went to Syria, and Pompey to Spain, while C.'s provincial government was prolonged for five years. He now undertook a fourth campaign against two German tribes who were about to enter Gaul. He was again successful; and pursuing the fleeing enemy across the Rhine, spent 18 days in plundering the district inhabited by the Sigambri. He next invaded Britain, about the autumn; but after a brief stay in the island, returned to Gaul. The Roman senate, astonished at his hardihood and his successes in regions where no Roman army had ever been before, accorded him a public thanksgiving of 20 days. In 54 b.c., C. opened his fifth campaign by a second invasion of Britain. On his return to Gaul, C. was compelled—on account of the scarcity of corn, arising from drought—to winter his army in divisions. This naturally aroused the hopes of the Gauls, who thought the time had come for recovering their independence. An insurrection broke out in the n.e. of Gaul, which was at first partially successful, but was ultimately crushed. C. resolved to winter at Samarobriua (Amiens), in the vicinity of the malcontents. In 53 b.c., C. commenced his sixth campaign. It was chiefly occupied in crushing a second insurrection of the Gauls. C. now returned to northern Italy, that he might be able to communicate more easily and securely with his friends at Rome. That city was gradually becoming more anarchic, the evils of weak government more apparent; the hour for decisive action seemed to be approaching, and doubtless C.'s heart beat with expectation of the mighty future, when all at once the plot that fate was weaving in his favor appeared to be completely marred by a tremendous rebellion over the whole of Gaul, headed by a young warrior named Vercingetorix. It was in the dead of winter when the news came to C., who instantly saw that, at all hazards, he must preserve his fame and his army. Leaving, therefore, Pompey to succeed at Rome, he hurried to meet the insurgent hordes. His great difficulty was to collect his scattered legions. First crossing, with some cisalpine and provincial troops, the mountains of Auvergne, though they lay 6 ft. deep in snow, he suddenly appeared among the Arverni, who, terrified at his unexpected approach, sent for their chief, Vercingetorix, to come to their assistance. This was what C. wished. After some wonderful exhibitions of military skill and numerous successes, Vercingetorix was shut up in Alesia (Alise in Burgundy) with all his infantry. C. besieged him, and though harassed by nearly 300,000 Gauls without, who attempted, but in vain, to break through the well-defended Roman lines, forced Vercingetorix to capitulate. Many of the tribes now hastened to submit to C., who prudently determined to winter among the vanquished. The senate, of course, voted him another public thanksgiving. Next year (51 b.c.), C. proceeded to quell the tribes who still held out. This he successfully accomplished, and having in addition reduced the whole of Aquitania, passed the winter of his eighth campaign at Nemetocenna, in Belgium, where he spent the time both in a magnanimous and politic manner. The Gallic princes were courteously and generously treated; the common people were spared the imposition of further taxes, and everything was done to render it possible for him to visit Italy with safety in the spring. This he did, and took up his residence at Ravenna, where he was informed of everything that was going on by the tribune C. Curio. There can be no doubt that at this moment he was the most popular man in the state, while his soldiery were devoted to him with a loyalty as enthusiastic as that which Bonaparte inspired when fresh from his Italian victories.

Meanwhile, Pompey, whose vanity could not endure the greatness of C., had been gradually veering round again to the aristocracy, whose dread of the new conqueror was hourly increasing. After much futile diplomatic finessing on all sides, the senate carried a motion "that C. should disband his army by a certain day; and that, if he did not do so, he should be regarded as an enemy of the state." The tribunes, Mark Antony and Q. Cassius, put their veto on this motion; but they were violently driven out of the senate-chamber, and, fearing for their lives, they fled to C.'s camp. The

senate, in the madness of their terror, now declared war, and intrusted the conduct of it to Pompey, whose pride in the invincibility of his military prowess hindered him from taking the necessary measures for the defense of the state. He fancied that his name would bring thousands to his standard, and he was even led to believe that C.'s troops were willing to desert their general: the result of which delusion was, that when hostilities formally commenced, he had hardly any soldiers except two legions which had recently been in the service of his rival. C., on the other hand, perceiving that the time for decisive action had at length come, harangued his victorious troops, who were willing to follow him anywhere; crossed the Rubicon (a small stream which separated his province from Italy proper), and moved swiftly, amid the acclamations of the people, towards Rome. Pompey fled to Brundisium, pursued by C., but contrived to reach Greece in safety, 17th March, 49 B.C. The Italian cities had everywhere gladly opened their gates to the conqueror as a deliverer. In three months, C. was master of all Italy.

C. next subdued Pompey's legates in Spain, who were at the head of considerable forces. On his return, he took Massilia, where he learned that he had been appointed dictator of the republic—a function which at this time he retained only for 11 days, but these were honorably distinguished by the passing of several humane enactments. Pompey, now thoroughly alive to the magnitude of his danger, had gathered, in Egypt, Greece, and the east, a powerful army, while his fleet swept the sea. C., however, crossing the Adriatic at an unexpected season, made a rush for Dyrrhachium, where Pompey's stores were; but was nevertheless outstripped by his opponent. Pompey entrenched his army on some high ground near the city, where he was besieged by Cæsar. The first encounter was favorable to Pompey, who drove back C.'s legions with much loss. The latter now retreated to Thessaly, followed by his exulting enemies. A second battle ensued on the plains of Pharsalia, 9th Aug., 48 B.C. Pompey's army was utterly routed; Pompey himself fled to Egypt, where he was murdered. See POMPEY.

No sooner had the news reached Rome, than C. was again appointed dictator for a year, and consul for five years. He was invested with tribunicial power for life, and with the right of holding all the magistratical comitia except those for the election of the plebeian tribunes. He did not, however, return to Rome after the battle of Pharsalia, but went to Egypt, then in a distracted condition on account of the disputes regarding the succession. Out of love for Cleopatra (who subsequently bore him a son), he entered upon the "Alexandrine war," in which he was successful, and which he brought to a close in Mar., 47 B.C. He next overthrew a son of Mithridates, near Cela, in Pontus, Aug. 2 of the same year, and arrived in Rome in September. He was once more appointed dictator, and the property of Pompey was confiscated and sold. Before the close of the year, he had set out for Africa, where his campaign against the Pompeian generals, Scipio and Cato, was crowned with victory at the battle of Thapsus, 6th April, 46 B.C. Cato committed suicide at Utica, and with such irresistible celerity was the work of subjugation carried on, that by the end of the summer C. was again in Rome. Now occurred that display of noble and wise generosity which proves C. to have been possessed of a great magnanimous nature. He was not a man that could stoop to the vulgar atrocities of Marius or Sulla, and so he majestically declared that henceforth he had no enemies, and that he would make no difference between Pompeians and Cæsarians. His victories in Gaul, Egypt, Pontus, and Africa were celebrated by four great triumphs, during which the whole Roman populace was feasted and fêted by the magnificent liberality of the dictator.

He now proceeded to check, by wholesale enactments, as far as in him lay, the social evils which had long flourished in the city. During the year 46 B.C., also, he conferred a benefit on Rome and on the world by the reformation of the calendar, which had been greatly abused by the pontifical college for political purposes. After quelling an insurrection which now broke out in Spain, where Pompey's sons, Cneius and Sextus, had collected an army, he received the title of "Father of his Country," and also of *imperator*, was made dictator and *præfectus morum* for life, consul for 10 years; his person was declared sacred, and even divine; he obtained a body-guard of knights and senators; his statue was placed in the temples; his portrait was struck on coins; the month Quintilis was called Julius in his honor; and on all public occasions he was permitted to wear the triumphal robe. He now proposed to make a digest of the whole Roman law for public use, to found libraries for the same purpose, to drain the Pontine marshes, to enlarge the harbor of Ostia, to dig a canal through the isthmus of Corinth, and to quell the inroads of the barbarians on the eastern frontiers; but in the midst of these vast designs he was cut off by assassination on the ides (15th) of Mar., 44 B.C. The details of this crime—the greatest disaster that could have befallen the Roman world, as subsequent events showed—are too familiar to require narration. It is sufficient to say that, of the sixty aristocrats who were in the conspiracy, many had partaken of C.'s generosity, and all of his clemency. A few, like Brutus, out of a weak and formal conscientiousness, based on theory rather than insight, were probably offended by C.'s desire to change the form of government into a hereditary monarchy; but the most, like Cassius, were inspired by a spleenful hatred of the dictator, and the base ambition of regaining power at all hazards.

C., who was 56 years of age when he was murdered, was of a noble and kingly pres-

ence, tall of stature, and possessing a countenance which, though pale and thin with thought, was always animated by the light of his black eyes. He was baldheaded (at least in the latter part of his life), wore no beard, and though of a rather delicate constitution naturally, he ultimately attained to the most vigorous health. His besetting sin was sensuality; but without meaning to detract from the criminality of his conduct in this respect, it may be said that it was as much the sin of the times in which he lived as his own, and that the superlative grandeur of his position gave a prominence to his licentiousness which a more humble lot would have escaped. His intellect was marvelously versatile. In everything he excelled. He was not only the first general and statesman of his age, but he was—excepting Cicero—its greatest orator. As a historian, he has never been surpassed and rarely equaled in simplicity and vigor of style, and in the truthfulness with which he narrates events of which he was an eye-witness. He was, in addition, a mathematician, philologist, jurist, and architect, and always took great pleasure in literary society. Most of his writings have been lost, though their titles are preserved; but we still possess his invaluable *Commentarii* (generally known as “Cæsar’s Commentaries on the Gallic and Civil Wars”). The *editio princeps* was printed at Rome 1449. C.’s life was formally written in ancient times by Suetonius and Plutarch. There are modern lives by Delorme, Napoleon III. (1865), and J. A. Froude (1879).

CÆSAR, Sir JULIUS, 1537–1636; an English statesman, educated at Oxford and the university of Paris; doctor of civil and canon law. He was master of the rolls, and held other high offices under Elizabeth and James I. He was noted for a gracious dignity of character, and for wide beneficence to the poor.

CÆSAR’A (*Turris Stratonis*), called by the natives “Kaisari’yeh.” This once proud and splendid seaport, perhaps one of Herod’s most magnificent works—a Grecian town with its temples, amphitheater, baths, etc., imported into Syria—was situated on the coast of Syria, 95 m. s. of Beyrout, and 37 m. n. of Jaffa.

In 65 A.D., Gessius Florus, the worst of all petty tyrants that had afflicted Judea, was appointed governor of Cæsarea. About that time, a terrible revolution, which commenced at C., broke out all over Judea. It arose from a dispute between the Syrian and Jewish citizens of C. as to which of them the city really belonged to; and some idea may be formed of the extent of the insurrection from the fact that above 20,000 Jews were massacred in C. in the space of one hour; 13,000 in one night at Scythopolis; 50,000 at Alexandria; 8000 at Joppa; and 10,000 at Damascus.

C. was occupied by the crusaders; after them, it seems to have gradually decayed into nothingness. It is now a heap of half-buried ruins, with a few miserable stone houses inhabited by fishermen.

CÆSAR’A PHILIP’PI (*Panium*). This town, mentioned in Matt. xvi. 13, was situated about 20 m. n. of the sea of Galilee. It was distinguished from the Cæsarea on the coast of Syria by the appendage of “Philippi,” given to it in honor of Philip the tetrarch, who repaired the city. It is now a heap of ruins, overgrown with bushes and grass.

CÆSAREAN OPERATION (*cædo—cæsus*) has, from very ancient times, been the popular name for *hysterotomy* (*hystera*, uterus; *tome*, section). Pliny distinctly alludes to it in his *Natural History* (lib. vii. cap. ix.), saying that Cæsar was so called from being taken by excision out of the womb of his mother, and that such persons were called *Cæsones* (Cæsar a cæso matris utero dictus; quæ de causâ Cæsones appellati). In his case, the mother must have survived the operation, as Aurelia was alive when her son invaded Britain.

The pages of a popular work scarcely allow of the details of such a proceeding, but we may state that the first incision is made exactly in the middle line of the body, to the length of 6 or 7 inches. When the uterus is exposed, it must be carefully opened, the child lifted out, and then the after-birth. The uterus now contracts, and sinks down into the pelvis, the wound is closed, and opium is given to the patient to allay pain and nervous irritability.

In Great Britain, the C. O. has been rarely performed, most likely from the skill of the accoucheurs rendering such a proceeding unnecessary; but still several cases are on record where not only the child, but the mother, was saved. Some women, indeed, seem to have accepted it as their usual method of delivery, having several children, each requiring to be removed through an abdominal incision; one woman submitted to it seven times. It has also been successfully performed in most unfavorable circumstances. In the year 1500, a sow-gelder operated successfully on his own wife; an illiterate Irish midwife, Mary Donally, operated with a razor on a poor farmer’s wife in Jan., 1738, and removed a dead child; her patient completely recovered, so as to be able to walk a mile on foot on the 27th day after the operation. Nay, a negro woman in Jamaica cut herself open with a butcher’s knife, removed her infant, and recovered. Practitioners are not quite decided as to the circumstances which justify the performance of this severe operation on the living female, but all agree on the propriety of at once removing by it the child of a recently dead woman. Numa Pompilius decreed that every pregnant woman who died should be opened; and the senate of Venice, in 1608, decreed that practitioners should perform, under heavy penalties, the C. O. on pregnant women supposed to be dead. In 1749, the king of Sicily decreed the punishment of death to

medical men who omitted to perform it on women dying when advanced in pregnancy. Of course, to be of any use, it must be performed immediately.

CÆSIUM. See **RUBIDIUM.**

CÆSU'RA, a pause or division in a verse; a separation by the ending of a word, or by a pause in reading, of syllables rhythmically connected, as in this line: "These parting num-bers, ca-denced by my grief."

CAF, or **KAF**, the mountain, or range of mountains, that in Arabic and Persian fiction surrounds the earth. The pivot on which the mountain rests is a great emerald from which the sky receives its colors, and the mountain is the dwelling-place of giants and genii. "From Kaf to Kaf" signifies from one to the other end of the world.

CAFFA. See **KAFFA.**

CAFFAREL'LI, or **GAFFARELLI**, **GAËTANO MAJORANO**, 1703-83; an Italian vocalist who, when a boy, was properly qualified for singing feminine parts, and was deemed the first soprano of the age. He was highly successful for many years, having no rival excepting possibly Farinelli; and he had success as a composer also. On returning to private life he built a palace, over the entrance of which he inscribed: "Amphion built Thebes; I this house," alluding to the story that the walls of Thebes rose without hands to the music of Amphion's lyre.

CAF FEÏNE, or **THEÏNE** ($C_{16}H_{10}O_4N_4.2HO$), is the alkaloid or active principle of coffee (q.v.) and tea (q.v.). When isolated, it forms beautiful white crystals, with a silky luster, which are soluble in water, alcohol, and ether. It is present in coffee to the extent of about 1 per cent, and in ordinary or Chinese tea, from $2\frac{1}{2}$ to 6 per cent; and is also found in Paraguay and Guiana teas. It may be extracted from coffee or tea by making a decoction in hot water, and adding acetate of lead, which causes a precipitate of caffeotannate of lead. When the latter is acted on by sulphuretted hydrogen, the lead is separated, and the C. left in solution. On evaporation of the liquid, and recrystallization from alcohol, the C. separates in crystals.

CAFFER BREAD, a name given to several species of *encephalartos*, trees of the natural order *cycadaceæ* (q.v.), which, like many others of that order, have much starch in their stems, and afford food to the natives of South Africa. They are also called bread-trees.

CAFFERS. See **KAFIRS.**

CAFFRA BIA. See **KAFFRARIA.**

CAFFRISTAN'. See **KAFIRISTAN.**

CAGAYAN' SOOLOO', an island of the Asiatic archipelago, in lat. $6^{\circ} 58'$ n., and long. $118^{\circ} 28'$ east. It is about 20 m. in circumference, well wooded and elevated.—Cagayan is also the name of a province, river, and lake on the island of Luzon, one of the Philippines.

CAGLI, a walled t. in the province of Urbino, Italy, at the confluence of the Cantiano and Busso, where there is an old Roman bridge over the former river. It is a bishop's seat, and has several monasteries, in one of which is a famous fresco by Giovanni Sanzio, the father of Raphael. Leather manufacturing is the chief business. Pop. 10,213.

CAGLI'ARI, a province of Sardinia, occupying the s. part of that island; 5224 sq.m.; pop. '72, 393,208. The district is rough and mountainous, but the cultivation of grain and cattle-breeding are successfully prosecuted. There are mines of silver, lead, and iron.

CAGLI'ARI, the capital of the island of Sardinia, situated on the side of a hill, on the n.e. shore of a spacious bay, and on the s. coast of the island, in lat. $39^{\circ} 13'$ n., long. $9^{\circ} 8'$ east. It has a spacious and safe harbor, defended by several forts, and is the emporium of all the trade of the island. The town contains many public buildings and churches, and has a university with 100 students; but its streets, for the most part, are very narrow, steep, and dirty. C. has a pop. of (1872) 32,834. It has also a dockyard, and a good road was some years ago constructed from C. to Sassari, the second city in the island, and to some of the more considerable places. Steamers ply very frequently between C. and Genoa; and it is now united to the continent of Europe by a line of electric telegraph.

CAGLI'ARI, **PAOLO**, best known as *Paolo Veronese*, an Italian painter of great eminence, was b. at Verona in 1532. He first studied under his uncle, Antonio Badile, a respectable artist, and afterwards settled in Venice, where he rapidly acquired both wealth and reputation. He had for contemporaries both Titian and Tintoretto, and was held in equal admiration with these famous painters. The church of San Sebastiano, in Venice, contains many of his productions, which are reckoned the most important of his earlier period—i.e., the period before he visited Rome, when he first became acquainted with the masterpieces of Raphael and Michael Angelo. The influence of the Roman school on his style was so happy, that, on his return, he received the honor of knighthood from the doge. He died 19th April, 1588. C. is remarkable for the fertility of his

imagination. His design is generally noble, his composition rich, and his execution truthful. In the invention of details, especially, he is inexhaustible, and often overloads his pictures with ornament. One peculiarity of his works is the frequent introduction of splendid architectural backgrounds, which, however, were generally painted by his brother Benedetto. The most celebrated of his productions is the "Marriage Feast at Cana of Galilee," now in the Louvre at Paris. It is 20 ft. high, and 30 in length, and contains 130 figures. Besides these may be mentioned "The Calling of St. Andrew to the Apostleship," "The Feast of Simon," and the "Presentation of the Family of Darius to Alexander."

CAGLIOSTRO, Count **ALESSANDRO DI**, a notorious impostor, who, in the latter part of the 18th c., traveled through Europe, and whose adventures afford considerable insight into the social characteristics of his times. He was born at Palermo, of poor parentage, June 2, 1743, and his true name was **GIUSEPPE BALSAMO**. Carlyle's picture of him when a boy—"brass-faced, vociferous, voracious"—is probably accurate, and already prophesies the bold and boisterous quack. When 13 years old, he ran away from the seminary of St. Roch, and was afterwards sent to a monastery at Cartagire. Here he became assistant to the apothecary of the monastery, and picked up that scanty knowledge of chemistry and medicine, which was afterwards found quite sufficient to impose upon so many respectable individuals. His conduct in the monastery was in keeping with his character, but finding it too contracted a sphere for the development of his ambitious genius, he left it, or was ejected, and for a time led "the loosest life" in Palermo. When 26 years old, he found it highly advisable to leave his native place. In company with a certain sage named Althotas, C. is vaguely represented as traveling first in some parts of Greece, Egypt, and Asia. At Rome, "his swart, squat figure first becomes authentically visible in the Corso and Campo Vaccino. He lodges at the sign of the Sun in the rotunda, and sells etchings there," very hard up at this time. In Venice, "the bull-necked forger" contrived to marry a very pretty woman named Lorenza Feliciana, who became a skillful accomplice in his schemes, and captivated many admirers, while C. picked their pockets. C. now made the tour of Italy with great success as a physician, philosopher, alchemist, freemason, and necromancer! Next, he extended his victorious career through some parts of Germany, and especially carried on a lively business in his "elixir of immortal youth," which became very popular among the ladies. By virtue of this fine medicine, the count assured his patients that he had already attained his 150th year, while his young and charming wife often talked affectionately of her son as "a commander in the Dutch navy." Through Courland, the count and his accomplice advanced triumphantly to the court of St. Petersburg, where he seems to have first made a failure; for the empress Catharine, aided by her Scotch physician, Rogerson, a keen-witted native of Annandale, who skeptically examined his famous "Spagirie food," and pronounced it "unfit for a dog," penetrated his real character, and made him the subject of a comedy. C. soon found it convenient to vanish. We next find him at Warsaw, discoursing on his pet Egyptian masonry, medical philosophy, and the ignorance of doctors, but he has the misfortune to be unmasked by a certain count M. This, however, had little effect on the stupid credulity of C.'s dupes—belonging, it must be remembered, to the upper classes, who in that age, according to Carlyle, were at once sensual, infidel, and superstitious—so that they persisted for a time in "distending his pockets with ducats and diamonds," which, however, his lavish dissipation soon scattered to the winds—for this prophet of a new physical and moral regeneration, and inventor of an "invaluable pentagon for abolishing original sin," was a desperate gambler. In 1780, he went to Strasburg; and soon afterwards we find him in Paris, still founding lodges of "Egyptian freemasons," holding nocturnal meetings for calling "spirits from the vasty deep," etc., and scandalously simulating the character and deeds of a philanthropist. From Paris he came over to England, where he was cordially received by the followers of Swedenborg. On his return to Paris (1785), he became distinguished at court, was intimate with the weak and credulous cardinal Rohan, and played a prominent part in the affair of the diamond necklace (q. v.). This lodged him in the Bastille; but he cleared himself by a statement which gained credit, and, after being liberated, carried on his adventures once more in England, but feebly, the sunshine of success now obviously growing dim; in short, the count, in gloom and foreboding, disappeared from the island. But the market in Germany, too, was closed, a general distrust having been excited by the revelations of one of the count's dupes. Elsewhere, also, these began to fail him. "At Aix, in Savoy, there are baths, but no gudgeons in them;" at Turin, he is ordered off by the king; a similar fate befalls him at Roveredo; at Trent, we catch a glimpse of him, "painting a new hieroglyphic screen," which, however, attracts no more the gaping crowd; lower still, "he pawns diamond buckles;" finally, his wayworn wife—in whom, perhaps, because of her womanhood, the enormous lie and quackery first breaks up—"longs to be in Rome by her mother's hearth, by her mother's grave, where so much as the shadow of refuge awaits her." In May, 1789, he entered the city; on the 29th December, the holy inquisition detected him founding "some feeble ghost of an Egyptian lodge." He was imprisoned, and condemned to death for freemasonry. His sentence was commuted to imprisonment for life in the fortress San Leon, where, in spite of his "elixir of immortal youth," he

died, 1795, aged 52 years. His wife ended her days in a convent. His *Mémoires Authentiques*, posthumously circulated in Paris, were *not* authentic.—See Carlyle's *Miscellaneous Essays*, art. Count Cagliostro.

CAGNOLA, LUIGI MARCHESI, a distinguished Italian architect, was b. at Milan in 1759—d. 1833. Belonging to an ancient and wealthy family, he could afford to follow the bent of his own inclination, and devoted himself earnestly to the study of architecture. His master-works are two triumphal arches. The first is the famous *Arco della Pace*, in Milan, commenced in 1807, but not finished until 1838. It is constructed of white marble, and, with the exception of the *Arc de l'Etoile*, in Paris, is both the largest and noblest structure of the kind in Europe, reaching a height of 78 feet. On the top of the arch is a bronze figure of Peace, in a car drawn by six horses, while the sides are richly adorned with innumerable bas-reliefs. The second forming the *Porta di Marengo*, or *Porta Ticinense*, is also a work of great beauty, and is much admired. Besides these may be mentioned the *campanile* (bell-tower) at Urgnano, in the Bergamese.

CAGOTS is the name given to a tribe of men, of manners and customs akin to those of the gypsies, who are found scattered through various parts of Bearn and Gascony, in France. They are usually thought to be the descendants of the Visigoths, who remained in France after their defeat by Clovis, in the 5th century. Until the French revolution of 1790, they received even worse treatment than that which generally falls to the lot of remnants of conquered races. They were forced to wear a peculiar dress, were forbidden to practice all but the most menial trades, and were obliged to live isolated, either in separate villages or in separate quarters of the towns. So complete was their estrangement from the other inhabitants, that they were forced to enter the churches by doors specially set apart for them. Since that revolution, they have been placed, as regards the law, on an equal footing with other citizens, but socially they are still regarded as a degraded race. Their language has been, so far back as is known, a corrupt dialect of that spoken in the surrounding country; but their blue eyes, fair hair, and fair complexion, mark them out as ethnologically distinct, and speak to a Teutonic origin. From a great liability to the diseases afflicting cretins, probably caused by their exposed manner of life and insufficient nourishment, they were at one time erroneously thought to belong to that unfortunate class. Tribes, whose history and present condition greatly resemble those of the C., are to be found in Brittany, where they receive the name of "Caqueux;" and in Poitou, Maine, and Anjou, where they receive the name of "Colliberts." See Michel's *Histoire des Races Maudites de la France et de l'Espagne* (History of Outcast Races in France and Spain), Par. 1847.

CAGSANA, a t. near the southern extremity of the island of Luzon, Philippines, with a population of about 13,000.

CAHAWBA, a river rising in Jefferson co., Ala., flowing s.w. through a region rich in coal, and joining the Alabama 8 m. w. of Selma. The C. is navigable by small craft for about 100 miles.

CAHEN, SAMUEL, 1796-1862; a French Jew noted as a Hebrew scholar. He translated the Old Testament into French with Hebrew on opposite pages, and with notes and comments. He also founded the *Archives Israelites*, a monthly publication devoted to Jewish questions and interests.

CAHETE, or CAETE, a small t. of Brazil, in the province of Minas Geraes, about 250 m. n. of Rio de Janeiro. The town is tolerably built, has some churches, a hospital, primary school, electoral college. Agriculture and mining are carried on. Pop. about 6000.

CAHINCA, the Indian name of the plant known in Brazil as the *raiz petra*, used by the natives as a purgative, emetic, or diuretic medicine.

CAHIR, a t. in the co. of Tipperary, Ireland, on the Suir, beautifully situated at the e. end of a valley between the Galtees and Knockmeleadow mountains, 8 m. n.w. of Clonmel. In the town is the seat of the earl of Glengall, with a park which extends along the river for 2 m. below the town. Cahir castle, an ancient irregular Norman structure of considerable extent, is situated on a rock on the left bank of the Suir. It was taken by the earl of Essex in 1599, and by Cromwell in 1650; it has been lately restored. C. has extensive flour-mills, and a pop. of (1871) 2694. There are large barracks near Cahir.

CAHORS (anciently, *Dicoma*), a t. in the department of Lot, France, is situated on a small rocky peninsula, formed by a bend of the river Lot—here crossed by three bridges—about 60 m. n. of Toulouse. The streets of C. are steep and narrow, and present many specimens of antique architecture. It has a fine cathedral, and several Roman remains, including those of a magnificent aqueduct. There is an obelisk to Fénélon, who was a student at the university here. The town was taken and pillaged by Henri of Navarre in 1580. It has manufactures of cotton-yarn, woolens, leather, paper, glass, etc.; the district produces wine in considerable quantities. The pop. in 1872 was 11,416: and in '76, 12,190.

CAIAPHAS, high-priest of the Jews in the reign of Tiberius Cæsar, at the beginning of Christ's ministry, and also at the time of his trial and crucifixion. His wife was the

daughter of Annas, a former high-priest, who still had great influence in sacerdotal matters. In the council summoned by the chief-priests and Pharisees to take action upon the remarkable spread of the doctrines of Jesus, Caiaphas, was decidedly in favor of putting him to death, using the prophetic language: "Ye know nothing at all; nor consider that it is expedient for us that one man should die for the people, and that the whole nation perish not." Christ was arraigned before Caiaphas, when the effort to convict him on false testimony failed; and then the prisoner was called as a witness and asked if he was indeed the Christ, the son of God. The answer being in the affirmative, the high-priest pretended to be sorely grieved at what he considered blasphemy, and appealed to Christ's enemies to say if that was not enough. The answer was that Christ deserved death, and without remonstrance from the high-priest, they at once fell upon the prisoner with insult and injury. But the high-priest had not the power of final condemnation, that being in the hands of the Roman governor only.

CAICOS, or **CAYOS**, or **KEYS**, a term applied to numberless rocky islets of the West Indies, and that generally with a reference to some more considerable island in the neighborhood. Thus, to take the Bahamas as an instance, there are the Keys of Providence, of Eleuthera, of Abaco, etc. But more specifically the name is often appropriated to the more southerly members of the group just mentioned—North, West, East, Grand, and other keys together covering about 450 sq. m., and containing about 5000 inhabitants. They lie between 21° and 22° n. lat., having been transferred, with a local president, from the government of Bahama to that of Jamaica. The revenue is about £8000. The imports are valued at nearly £30,000; and the exports (consisting chiefly of salt) at £25,000.

CAIFA, or **HAI'FA**, a seaport on the coast of Syria, situated exactly opposite Acre, upon a spur of Mt. Carmel, and on the s. side of a wide semicircular bay, 4 m. across. It is the ancient Hefa, or Sycaminopolis. It covers but a small space of ground, and contains no edifice of any note except a few minarets. The houses are built of rough unhewn sandstone, plastered over with lime—the roofs flat. Pop. about 2000—Moslems, Christians, and Jews. C., having a better anchorage than Acre, is fast eclipsing that city as a port, and in recent years almost all the trade of Acre has been transferred to it. Consular agents from England, France, etc., have, within twenty years, been established at C.; and among other improvements are a coffee-house and billiard-room, things rare in Syria. Several cargoes of barley, wheat, and sesame seed are yearly shipped at C., and exported to Great Britain and France. C. is surrounded by beautiful gardens of palm, olive, orange, citron, fig, mulberry, and pomegranate trees.

CAILLIAUD, **FRÉDÉRIC**, 1787–1869; a French goldsmith who traveled in various parts of Europe, Egypt, and Asia Minor. He was engaged by Mehemet Ali to explore the deserts along the Nile and near the Red Sea, and in the work discovered the emerald mines of Mt. Zabarah. He returned to France with a valuable collection of antiquities, plants, and minerals, and published *Voyage à l'Oasis de Thebes*, etc. He went again to Egypt and made explorations in the eastern deserts, making an expedition to upper Nubia with Ismael Bey. In 1819–22, he published *Voyage à Meroe*. Among the relics of antiquity brought by him to France and purchased by the government, was a mummy, inscribed with hieroglyphical characters accompanied with a Greek translation, which proved of great help to Champollion in the study of the ancient language.

CAILLIE, **RENÉ** or **AUGUSTE**, a French traveler, noted for his journey to Timbuctoo, was born 19th Sept., 1799, at Mauzé, in the department of Deux-Sèvres. Having gone to Senegal, and engaged in trading with the natives, he learned, about 1826, that the geographical society of Paris had offered a premium of 10,000 francs to the first traveler who should reach Timbuctoo. Provided with a stock of goods for barter, C. started from Sierra Leone, Mar. 22, 1827, and after some delay caused by illness, he reached the mysterious city in April, 1828, where he remained 14 days. On leaving Timbuctoo, he accompanied a caravan across the Sahara desert, reaching the coast at Tangier. After hearing and examining his statements, the society awarded him the offered prize, with a pension of 1000 francs, and the order of the legion of honor. His notes of travel, arranged by M. Jomard, were published under the title *Journal d'un Voyage à Tembouktou et à Jenné dans l'Afrique Centrale*, etc. (3 vols., Par. 1830). In England, doubts were raised as to the veracity of C., but without just grounds. C. died at his estate, in the neighborhood of Paris, May 25, 1838.

CAIMACAN', or **KAIMAKAM**, a Turkish officer corresponding with lieutenant or lieutenant-governor. The caimacan of Constantinople is the lieutenant of the grand vizier, whom he represents in processions. Such officers also act as governors in the principal towns.

CAIN, the first-born of Adam and Eve. His history, as recorded in the book of Genesis, is mysterious and inexplicable, and the traditions which a later superstition has gathered round it, have thrown no light whatever on its dark perplexity. As the first murderer, his memory has always been profoundly execrated by the Christian church; yet such is the perversity of human nature, that one sect—if not more—of the pseudo-Gnostics found his actions and character so much to their liking, that they called themselves *Cainites* (130 A. D.), and invented an explanation of his alleged crime, which, like

most of the Gnostic heresies in the early church, sprang out of the deep-rooted fundamental error of the "two principles." The Cainites believed that C. was the offspring of the intercourse of a superior power with Eve, and Abel of an inferior power; that their characters corresponded to their paternal parentage, and that the slaying of Abel only symbolized the victory of the superior over the inferior power. The subsequent punishments of C. were regarded as the persecutions of Abel's father—i.e., the Jewish God. For the same reason, they highly honored all the reprobates of the Old Testament—such as the people of Sodom, Esau, Korah, Dathan, and Abiram—whom they looked upon as the victims of the hatred of Jehovah. It is unfortunate that we possess only distorted and fragmentary accounts of this, as of all the other heretical sects. The Cainites are also said to have denied the dogma of the resurrection of the body, to have rejected the New Testament, and accepted a gospel of Judas, the betrayer, whom they also revered for the singular reason that his crime, by procuring the death of Christ, secured the salvation of men.

CAINOZOIC (Gr. "recent life"), a geological term, synonymous with tertiary, introduced with other words by Mr. Phillips, to avoid the confusion which attended the use of the terms primary, secondary, and tertiary, owing to the various meanings attached to them by geologists.

ÇA IRA (French for "It will go on!"), the well-known refrain of the song beginning with—

"Ah, ça ira, ça ira, ça ira!
Les aristocrates à la lanterne!"

which must always be remembered as associated with the most terrible scenes of the French revolution. Like the *Marseillaise*, the *Carmagnole*, and the *Chant du Départ*, it became a French national song, and was styled the *Carillon National*. The melody, taken from another song, is said to have been a favorite air with the unhappy Marie Antoinette.

CAIRD, JAMES, b. 1816; an agriculturist of Scotland, author of *High Farming as the Best Substitute for Protection*. In 1850-51, he visited all parts of England as agricultural writer for the *London Times*, his letters being afterwards published in a volume. In 1858, he visited the United States and wrote an account of the western territories. While in parliament he was the originator of agricultural statistics, now annually published by the British government. Since then he has been a magistrate in the co. of Wigton.

CAIRD, Rev. JOHN, D.D., a minister of the established church of Scotland, and one of the most eloquent living preachers in Great Britain, was b. at Greenock in 1820. He studied at the university of Glasgow, and in 1845 was ordained to the pastorate of the church of Newton-upon-Ayr, whence in 1847 he was translated to Lady Yester's, Edinburgh. Here his popularity was extraordinary, but the demands made on his physical energies were so great, that he found it necessary to retire to the country, and accepted, in 1849, the country charge of Errol, in Perthshire. A sermon which he preached before the queen in 1855, in the church of Crathie, and which was published, by royal command, under the title of *The Religion of Common Life*, was universally admired throughout Great Britain; translated on the continent under the auspices of chevalier Bunsen, who wrote a preface to it, and suddenly carried the fame of the author into all parts of the Protestant world. In 1857, Dr. C. accepted a call to Glasgow. In 1858, he published a volume of sermons, marked by beauty of language, strength of thought, and earnest sympathy with mankind. He received the degree of D.D. in 1860. In 1862, he was appointed professor of divinity, and in 1873, principal of Glasgow university. In 1874, he published *The Universal Religion*, a lecture delivered in Westminster abbey.

CAIRN, or **CARN**, a Celtic word, signifying a protuberance, a heap, a pile. In that sense, it appears in the names of hills and other natural objects in Scotland, Ireland, Wales, Cornwall, and Brittany. It is also applied to artificial heaps of unhewn stones, which, among archaeologists, have come to be generally known as "cairns."

There are several kinds of cairns. The simplest and most common form seems to be a conical pile of stones of no great size. Next is what may be called the fence or ringed C.—a heap of stones girdled round by large unhewn stones set upright in the ground. Some cairns have two, and a very few have three such concentric girdles; in some instances, there are concentric rows of upright stones within the cairn. Many cairns are found in the neighborhood of the circles of unhewn stone pillars which antiquaries used to style "Druidical." In a few instances, cairns are found at the end of an avenue of standing stones. Some cairns are fenced round by a narrow ditch and a small earthen rampart. A very few cairns have unhewn flat stones on their tops; a still smaller number are surmounted by an unhewn stone pillar. A few are oblong in shape.

Cairns were erected, doubtless, for several purposes. It appears from record that they were often raised to distinguish the marches or boundaries of lands. One C., near Balmoral, on the Highland Dee, is said to have been erected as a mustering-place for the men of Strathdee, who took its name, *Cairn-na-cuimhne*, or "C. of remembrance," for their slogan or war-cry. In later times, places where great crimes had been committed were marked by cairns; thus, "Mushet's C." in the Queen's park at Edinburgh, shows the spot where a wife was murdered by her husband, under circumstances of peculiar atroc-

ity, in 1720. But that the great purpose of the C. was sepulchral, is shown by the human remains found in so many of them. "*Disjectis et erutas, ossa inveniuntur, et quibusdam honor nominis adhuc manet,*" says Robert Gordon of Straloch, writing of Scotch cairns in 1654. "For the cairns or heaps of stones in several parts of Ireland," wrote Thady O'Roddy in 1617, "some of them were heaped as monuments of battles, some made in memory of some eminent persons buried in such a place." A Highland suppliant would have said to his benefactor: *Curri mi' cloch er do charne*, "I will add a stone to your cairn." The bones found in cairns are generally calcined or half-burned, and inclosed either in what are called *cists*—small rude coffins of unhewn stones—or in urns of earthenware, which, again, are in many cases protected by stone cists. Along with the bones are often found flint arrow-heads, flint axe-heads, stone hammers, stone rings, glass beads, implements of bone, bones of horses and oxen, spear-heads, and other weapons of bronze. In some instances, human bones are found unburned, inclosed in stone cists about 3 ft. long, or, more rarely, of the full size of a man. In one case, as many as seventeen stone cists were found in one cairn.

Many cairns are of considerable size. Each of three cairns at Memsie, near Fraserburgh, in Aberdeenshire, was about 300 ft. in circumference, and about 40 ft. high. A C. in the parish of Minnigaff, in Galloway, was 891 ft. in circumference. Several of the larger cairns are what is called "chambered"—that is, have internal galleries or cells. Of three large ringed cairns at Clava, on the banks of the Nairn river, near the battlefield of Culloden, one was found to contain a gallery, about 2 ft. wide, leading from the s. side of the C. to a circular chamber in the center, about 15 ft. in diameter, built of unhewn and uncemented stones, each course overlapping the other so as to meet at the top in that sort of rude dome which has received the name of the "beehive house" (q.v.). The Boss C., on the moor of Dranandow, in the parish of Minnigaff, had two galleries crossing each other—each 80 ft. long, 4 ft. wide, and 3 ft. high.

But of all the "chambered" cairns, the most remarkable is that at New Grange, on the banks of the Boyne, near Drogheda, in Ireland. It is 400 paces in circumference, and about 80 ft. high, and is supposed to contain 180,000 tons of stones. In 1699, it was described by Edward Lhwyd, the Welsh antiquary, as "a mount or barrow, of very considerable height, encompassed with vast stones, pitched on end, round the bottom of it, and having another, lesser, standing on the top." This last pillar has disappeared; of the outer ring of pillars, ten still remain, placed at about ten yards one from another. "The cairn," says Mr. Wakeman in his *Archæologia Hibernica* (Dublin, 1848), "in its present ruinous condition, presents the appearance of a grassy hill partially wooded; but, upon examination, the coating of earth is found to be altogether superficial, and in several places the stones, of which the hill is entirely composed, are laid bare. The opening [which is nearly square, and lined by large flags] was accidentally discovered about the year 1699. The gallery, of which it is the external entrance, communicates with a [dome-roofed] chamber or cave nearly in the center of the mound. This gallery, which measures in length about 50 ft., is, at its entrance, 4 ft. high; in breadth about 3 feet. Towards the interior, its size gradually increases; and its height, where it forms the chamber, is 18 feet. The chamber is cruciform, the head and arms of the cross being formed by three recesses—each containing a basin of granite. The sides of these recesses are composed of immense blocks of stone, several of which bear a great variety of carving, supposed by some to be symbolical. The majority of these carvings must have been executed before the stones had been placed in their present positions. The length of the passage and chamber from n. to s. is 75 ft., and the breadth of the chamber from e. to w. 20 feet. Of the urns or basins in the recesses, that to the e. is the most remarkable. It is formed of a block of granite, and appears to have been set upon, or rather within, another of somewhat larger dimensions." The Irish antiquaries believe that the chambered C. of New Grange—"the cave of Achadh Aldai," as it was called, from Aldai, the ancestor of the Tuatha De Danaan kings—was opened and rifled by the Norsemen in 862. About a mile from it, on either side, are other two cairns of nearly equal size, named Knowth and Dowth. The latter was opened in 1847, and found to contain a gallery, a cruciform chamber, a basin or sarcophagus, and carved stones, all of the same type as those of New Grange. Engravings of the sculptures, in both cairns, are given in Mr. W. R. Wilde's *Boyne and Blackwater*, pp. 192–207 (Dublin, 1850), and some of them are obviously of the same character with sculptures found in Scandinavia; at Locmariaker, and at Gavr Innis, in the Morbihan, in Brittany; in one of the cells of a tumulus opened in 1853 at Pickaquoq, near Kirkwall, in Orkney; among the ruins of an ancient fort at the Laws, near Dundee; at the ancient forts at Rowtin Lynn, and Old Bewick, in Northumberland; and on one of the standing stones near Penrith in Cumberland, called "Long Meg and her Daughters."

Cairns are most frequent in stony countries. Where, as in many parts of England, stones are scarce, the barrow or earthen mound came in place of the C., from which it differs only in the materials of which it is made. So also in Scandinavia. Cairns, or *dysser*, as they are there called, are rare in Denmark, but of more common occurrence in Sweden and Norway.

CAIRNES, JOHN ELLIOTT, 1824–75; b. Ireland; educated at Trinity college, studied law, and was admitted to the Irish bar, but passed most of his time in writing for the

press, chiefly upon economical questions affecting Ireland. In 1856, he was appointed professor of political economy in Dublin, and the next year his professional lectures were published under the title *Character and Logical Method of Political Economy*. He next wrote for *Fraser's Magazine* a series of essays on the gold question, induced by the sudden increase of supply from California and Australia. In 1861, he was appointed professor of political economy and jurisprudence in Queen's college, and in the next year published his work on *The Slave Power*. His conclusions were to a large extent verified by the results of the war in the United States then just commenced. In 1866, he was appointed professor of political economy in University college, London. His later years were spent in collecting and publishing his numerous papers, and in writing his chief work, *Some Leading Principles in Political Economy, newly Expounded*. He is regarded as high authority on subjects connected with political economy.

CAIRNGORM STONE, or simply **CAIRNGORM**, a name often given by jewelers, and particularly in Scotland, to brown or yellow quartz or rock-crystal, because found at Cairngorm, in Aberdeenshire. The same mineral is found in many other localities, as at Olivet near Orleans, in Brazil, and in Siberia. In Cairngorm and the neighboring district of Mar, it occurs both in the granite rock and in the alluvial soil. It differs from common colorless quartz or rock-crystal only in the presence of a very little oxide of iron or manganese, to which it owes its color. It is much used as an ornamental stone. The yellow variety is not unfrequently called topaz, although quite different from the true topaz, which it resembles chiefly in color, having neither its hardness nor its brilliancy. The topaz is, however, sometimes found along with it in the granite and gneiss districts of Mar and Cairngorm. The brown variety is sometimes called **SMOKY QUARTZ**, and when of a good and uniform color is by some preferred to the yellow.

CAIRO, a city in Alexandria co., Ill., on the extreme southern point of the state, at the junction of the Mississippi and Ohio rivers, 147 m. by rail s.e. of St. Louis; pop. '70, 6267; in '80, 9026. The Illinois Central railroad ends here, and connects by ferry with the Mobile and Ohio railroad at Columbus, in Kentucky. All the steamers of the Ohio and Mississippi make C. a stopping-place. It is a port of entry, and has a fine custom-house, and some other handsome buildings. The founders of C. anticipated its becoming the largest and most important city in the Mississippi valley, but the location was unhealthy, and the land so low that costly dikes were necessary to protect it from inundation; and even these did not suffice, for in 1858 the city was nearly destroyed by a flood. Since then, however, ample protection has been provided.

CAIRO (Arabic, *Musr el Kahirah*, "the victorious capital"), the capital of modern Egypt, is situated in lat. 30° 2' n., and long. 31° 16' e., in a sandy plain betwixt the right bank of the Nile and the ridge of Mokattam, and near the point of the delta of the Nile. From the foundation of the city in 969, the Fatimite caliphs of Africa, who brought the bones of their ancestors with them from Kairon, reigned for ten generations over the land of Egypt. The caliph Hakem, who built a mosque near Bab-el-Nassr, and who is the supposed founder of the Druse religion, was the third in the succession. In the year 1171, Saladin usurped the throne from the last of the Fatimites. His descendant, Moosa-el-Ashref, was deposed in his turn in 1250; from that time till the year 1517, when the city was stormed and taken by sultan Selim, C. was governed by a succession of Mameluke kings.

The city of C. occupies about 3 sq. m., and is surrounded by a low wall. Of late years it has been greatly improved. It is lighted with gas, and many fine broad streets have been opened through the crowded districts. The bazaars are well and richly supplied. The houses, which are generally two or three stories high, are all built of variegated brick, with interlinings of wood, and have flat roofs. The city is divided into different quarters, one quarter being appropriated to the Turks, one to the Christians, one to the Jews, etc.; so that every religious sect has its own quarter, which is separated from the adjoining one by strong gates at the end of the streets; these are closed at night, and guarded by a porter, who opens the gate when any one wants to pass.

The most remarkable buildings in the city of C. are its minarets and mosques. The minarets are the most beautiful of any in the Levant, of a prodigious height, and built of alternate layers of red and white stone. The most ancient of all the minarets is that attached to the great mosque of sultan Tayloou. This mosque was built in the year of the Hegira 265 (879 A. D.), before the foundation of the city, and consists of an immense cloister or arcade built on pointed arches, being the earliest extant in that form. Another magnificent mosque is that of the sultan Hassan, situated in the place of the Roumayli, near the citadel, and which was finished about the year 1362 A. D. It has two very elegant and high minarets, and the mosque, in consequence of its size, and the thickness of its walls, was frequently seized and made use of as a fortress by the insurgents in the numerous rebellions and insurrections which were always taking place at C. under the rule of the Mameluke kings. Stains of blood are still to be traced on the marble walls of the courtyard.

The population of C. consists of the ruling class, who are all Turks; Arabs, the former conquerors of the land, who form the bulk of the population, all the petty tradesmen and cultivators of the soil being of Arab origin; Copts, who are descended from the original lords of the land, the ancient Egyptians; Jews, Armenians, Syrians, Afri-

cans, and Europeans. Pop. '72, 350,000. The Copts, a mere fraction of the population, completed, in 1867, a fine, lofty, spacious church. Since 1863, the part of C. occupied by Europeans has been handsomely rebuilt. In 1876, C. was connected by rail with Heluan, one of the numerous bathing-places lying to the south.

Of objects worthy of note in the environs of C., there may be mentioned the tombs of the caliphs, situated about a mile beyond the walls, which are magnificent and imposing buildings, forming beautiful specimens of Arabian architecture. The mausoleum of sultan Bergook is a triumph of Saracenic architecture. The public gardens, which consist of groves of orange, citron, palms, and vines, are very beautiful. The trade of C. is rapidly increasing. The exports consist mainly of native products, such as ivory, gum, wood, hides, ostrich feathers, cotton, and sugar; while the imports are cotton and woolen goods, prints, hardware, cloth, furniture, shawls, indigo, sheep, tobacco, etc. The manufactures of C. embrace silk and cotton fabrics, gunpowder, glass lamps, sugar, sal ammoniac, weapons, and iron ware. C. is a great seat of learning, and popular education has recently advanced. The government college and the national schools are largely attended, while several thousand pupils attend the theological university attached to the mosque of Ezher. The schools comprise a commercial and juridical school at the Darb Algamâz, a school of arts and industry at Boolak (q.v.), and military schools at the Abbasseeyah. The language spoken at C. is Arabic, which, though not the purest, is superior in pronunciation to that spoken in Syria. C. is the official residence of the khedive of Egypt, and the residence of a consul-general from Great Britain, France, etc. C. has railway connection with Alexandria and Suez, and there is also a line to upper Egypt.

CAISSE, a coffer, box, case, or chest; in finance, a cash-box, or pay-office, or fund for payments. In anatomy, the drum of the ear. The French call a savings bank, "caisse d'épargne."

CAISSON, in military matters, is a name sometimes given to a tumbril or ammunition wagon. It is more frequently applied, however, to a large wooden chest or frame, loaded with powder, shells, or both, and buried several feet deep in the ground under some fortification; this destructive combination is to be blown up if there be danger of the enemy approaching and taking possession of that particular part of the defense-work. The French give the name of *caisson pour les vivres* to a large chest, carried with the army, and capable of containing 800 rations.

CAISSON, in relation to shipping, is an apparatus for lifting a vessel out of the water for repairs or inspection. It is usually a hollow structure, sunk by letting water into it. There is an air-chamber inside, which allows it to sink only to a certain depth. In that state it is hauled under the ship's bottom, the traps or openings are closed, the water is pumped out, and the caisson rises with the ship upon it.

In another arrangement, a platform is sunk to a certain depth in the water, and is suspended by iron screws from a strong wooden frame-work; the ship is floated upon the platform, steadied by shores, and lifted high and dry by means of levers, wheels, pinions, and screws.

CAISSON (*ante*), in engineering, a hollow box of iron or wood, open at the bottom, sunk where piers are to be placed. The largest caisson yet sunk was for the tower of the Brooklyn bridge on the New York side. At the bottom it was 172 ft. long and 102 ft. wide, with an air-chamber 9½ ft. high, the roof 22 ft. thick, and the sides carried up 82 ft. from the lower edge. It had a coffer-dam in the upper part; was built of timber lined with boiler-iron, and bolted together. In its construction there were used of lumber, board measure, 4,200,000 ft., and of iron, including bolts, 620 tons. When completed, it weighed 13,271 tons, and there were 30,000 tons of masonry laid within it. There were two double air-locks extending into the air-chamber, in which were steam-pipes to keep an even temperature. Two shafts passed up through well-holes in the masonry, with an elevator in one, and two spiral stairways in the other. Below the lowest edge of the caisson extended two water-shafts, each 7½ ft. in diameter, in which dredges and scoops grappled the stones and soil, raising their loads to cars above, which conveyed the refuse away. At the same time sand and fine dirt were blown out by air-pressure through 40 or more pipes in various parts of the structure. The interior was illuminated by gas, and constant communication by telegraph was kept up with the workmen inside. There were four shafts, each 2 ft. in diameter, for the introduction of material for the concrete with which the whole interior was finally filled. The caisson was sunk 78 ft. below mean tide, a work that required a pressure of 34 lbs. per sq. inch, in addition to the normal pressure of air; and to supply this addition, 13 large compressors were used. The earliest caissons for such purposes were used in England in 1738-40 in laying the foundations of the Westminster bridge over the Thames.

CAITHNESS, a maritime co., the most northerly on the mainland of Scotland. It is triangular in shape; length, from n. to s., 40 m.; greatest breadth, 30 m.; area, 712 sq. miles. Except in the w. and s., where the mountain-range (composed of granite and gneiss) dividing C. from Sutherland attains, in its highest point, a height of more than 2300 ft., the general aspect of C. is level and bare, being in great part moorland and destitute of trees, while the sea-coast is bold and rocky, with many bays, inlets, promon-

tories, and caves. On the n. coast are Dunnet head and Duncansby head; and on the w. side of the last-named head is a spot of green turf, called John o' Groat's house, where John de Groat or Groat of Warse settled with his brothers in James IV.'s time, and built a house. There are no navigable rivers in C., and no lakes of importance. The climate is damp and chilly, but snow rarely lies on the plains above a day or two at a time. Thunder is rare, but auroræ are seen almost nightly. There are no manufactures, properly so called, although weaving is carried on to some extent. Coal has not been found in C.; the common fuel is peat. The chief crops are oats, bear, turnips, and potatoes. The parts of the surface under tillage are generally a deep fertile loam on a strong till clay. In the n.e., the soil is sandy. The crops are 20 days later in ripening than in the Lothians. The occupants of many of the small farms divide their time between farming and fishing. There are herring, ling, cod, salmon, and lobster fisheries. The herring-fishery in July and August employs about 1500 boats, a part of which come from other parts of the Scotch coasts. Wick is the chief seat of the British herring-fishery. The average number of barrels cured annually in the ports of C. may be stated at 200,000. The other exports are cattle, oats, wool, and flag-stones, of which, as well as of freestone and slate, C. contains quarries. Wick is the only parliamentary borough in C.; another town is Thurso, an old burgh of barony. There were, when the census was taken in 1871, 7185 children in C., and of these, 6608 were receiving education. Pop. 39,992. The county returns one member to parliament, and Wick unites with Kirkwall, Dornock, Dingwall, Tain, and Cromarty, in returning another. A railway, completed in 1874, and extending to Wick and Thurso, connects C. with the south. In early times, C. is supposed to have been inhabited by Celts; these afterwards mixed with Danes and Norwegians. C., in the middle ages, was subject to the kings of Norway. David II. adopted the weights and measures of C. for all Scotland. The Scandinavian origin or mixture of the people of C. is shown by their tall forms and soft fair features, and their speaking English instead of Gaelic. C. has remains of Picts' houses, round towers, etc.

CAITHNESS FLAGSTONES are dark-colored bituminous schists, slightly micaceous and calcareous, valuable on account of their great toughness and durability for pavements, cisterns, and various other purposes, and accordingly are largely exported. They belong to the old red sandstone, and contain abundant remains of fossil fishes.

CAIUS, Dr. JOHN, the person from whom Caius college, Cambridge, takes its name, was b. at Norwich in 1510. His real name was Kaye or Key, which he Latinized into Caius. He was educated at Gonville hall, university of Cambridge; and at the age of 20, turned into English Chrysostom's *Method of Praying to God*, which was followed by a translation of Erasmus *On True Theology*. He next went abroad, and resided in Italy for several years, studying medicine. On his return to England, he practiced with success at Cambridge, Shrewsbury, and Norwich. Henry VIII. appointed him anatomical lecturer to the company of surgeons in London. In 1547, he was elected a fellow of the college of physicians, of which he was subsequently made president. He also became physician to Edward VI., queen Mary, and queen Elizabeth. In 1557, he obtained permission to elevate Gonville hall into a college, which took the name of Caius college, and of which he became master. This office he held till his death, in July, 1573. His principal work is *A Boke or Counsell against the Disease commonly called the Sweate or Sweatyng Sicknesse, Anno Do. 1552*. C., however, wrote a great number of works on a variety of subjects, critical, antiquarian, and scientific.

CAIUS COLLEGE. See GONVILLE AND CAIUS COLLEGE.

CAIVA'NO, a t. of southern Italy, in the province of Naples, and 8 m. n. of the city of that name. It was a place of considerable strength in the middle ages, and still retains many remains of its walls and towers, though they have suffered severely in the various revolutions of Naples. Pop. 10,000.

CAJAMARCA. See CANAMARCA, *ante*.

CAJATAMBO, a province in the department of Junin, Peru; 1500 sq.m.; pop. 24,750. The region is mountainous and comparatively barren, with a severe climate. There are many remains of ancient towns, aqueducts, etc. The chief town, of the same name, has a pop. of about 3200, and is in a fertile plain at the foot of the Andes, 140 m. n.e. of Lima. The people are employed in spinning wool for sale at Lima.

CAJEPUT, *Melaleuca cajuputi* or *M. minor*, a tree of the natural order *myrtaceæ*, sub-order *leptospermeæ*, from the leaves of which the pungent, aromatic, volatile oil, called *oil of cajeput*, is obtained by distillation. The C. tree is common on the mountains of the Moluccas. It is rather a small tree, with a crooked trunk, thick spongy bark, white wood (whence the name C., properly *kayuputi*, signifying white wood), elliptical-lanceolate alternate leaves, and terminal spikes of white flowers. The greater number of the species are natives of Australia, some of them very beautiful shrubs and frequent ornaments of British hot-houses. Much of the oil of C. of commerce is prepared in the island of Banda. It is said that two sackfuls of leaves yield scarcely three drams of the oil, which is green, transparent, limpid, with a strong penetrating odor, and agreeable only when much diffused.

CAJ'ETAN, or GAETANI, BENEDETTO. See BONIFACE VIII., *ante*.

CAJETAN, TOMMASO DE VIO, 1469–1534; an Italian priest of the Dominican order, and the general of that order. In 1517, Leo X. sent him as legate to induce Maximilian of Germany to join in the league against the Turks, and especially to bring the Lutherans back to allegiance to the church; but C.'s arrogant manner defeated the purpose for which he was sent. When Rome was taken by the imperialists in 1527, he was made a prisoner, but he bought his freedom for 5000 crowns. He made a translation of the Old Testament with commentary, and wrote a treatise on the authority of the pope which was answered by the faculty of the university of Paris.

CALABAR', the name of a coast district of upper Guinea, Africa, the limits of which are not clearly defined; but it is usually understood to extend between the river Benin and New Calabar, called by the Portuguese Rio del Rey, and as far n. as the Kong mountains. The surface is low and flat, and the climate unhealthy. Yams, which are the principal food of the inhabitants, are raised in plenty, and also the sugar-cane, and palms, from which palm-oil is obtained in large quantities. The inhabitants are polygamists, and make human sacrifices to good and evil spirits. The United Presbyterians have had a mission here since 1846, which is beginning to produce beneficial changes.

CALABAR (OLD), a river of this district, enters the bight of Biafra, about 52 m. w.n.w. of Fernando Po, by an estuary about 9 m. in breadth. It is navigable by steamers for about 200 m. above its mouth, and abounds in crocodiles. The chief towns on its banks are—Duke Town, situated on its estuary; Creek Town, further up, both seats of British missions; Acoono Coono, and Omun.—**CALABAR (NEW)**, a branch of the Niger, falling into the Bight of Biafra, in lat. 4° 30' n., and long. 7° 7' e. It has a bar across its mouth, which prevents the entrance of vessels drawing more than 12 ft.; but some miles up it has an average depth of 30 feet.

CALABAR BEAN, a very remarkable medicinal agent, which has been introduced into the new edition of the British Pharmacopœia (1867). It is the seed of *physostigma venenosum*, a twining, half-shrubby plant, a native of western Africa, of the natural order *leguminosæ*, sub-order *papilionaceæ*, nearly allied to the kidney bean, but of a genus distinguished by the hood-shaped stigma, and the deeply furrowed hilum of the seed. The following are the leading characters of the bean itself: "About the size of a very large horse-bean, with a very firm, hard, brittle, shining integument, of a brownish-red, pale chocolate, or ash-gray color. Irregularly kidney-shaped, with two flat sides, and a furrow running longitudinally along its convex margin, ending in an aperture near one end of the seed. Within the shell is a kernel, consisting of two cotyledons, weighing on an average about 46 grains, hard, white, and pulverizable, of a taste like that of the ordinary edible leguminous seeds, without bitterness, acrimony, or aromatic flavor. It yields its virtues to alcohol, and imperfectly to water." It is used in the form of an emulsion by the natives of Africa, as an ordeal when persons are suspected of witchcraft. About twenty years ago, Dr. Christison very nearly fell a victim to his zeal for science in experimenting on some specimens of this bean which had been sent to Edinburgh by some African missionaries, dangerous symptoms having been produced by 12 grains of the kernel which he swallowed. In 1861, Dr. Thomas R. Fraser tried the effects upon himself of doses of 6, 8, and 10 grains. The general symptoms were epigastric uneasiness, great feebleness, dimness of vision, salivation, giddiness, and irregular, feeble, and slow heart's action. About the same time, he made the interesting discovery, that when placed on the eyeball this substance contracts the pupil, and produces near-sightedness; and it is now frequently employed for these purposes by ophthalmic surgeons. In 1864, 50 children were poisoned by eating these beans, which were swept out of a ship at Liverpool. A boy aged six years, who ate six beans, died very rapidly. The chief symptoms in these cases were griping, vomiting, and contracted pupils; the face was pale, the eyes bright and protruding, and in trying to walk, the children staggered as if they were drunk. Dr. Fraser, in a paper which he communicated to the royal society of Edinburgh in 1866, maintains that, in mammals, death is generally produced by a combination of syncope (faintness) with asphyxia (suffocation); the symptoms of the one or the other depending on the dose, which, when large, at once destroys the heart's action. It has been used medicinally in small doses (one to ten grains of the powder, or $\frac{1}{4}$ to $\frac{1}{2}$ of a grain of the extract) in chorea, tetanus, general paralysis of the insane, and other diseases of the nervous system. Being now a recognized medicinal agent, it is satisfactory to know that the dangerous and even fatal effects of excessive doses may be prevented by administering belladonna, (night-shade), or its active principle, atropia, as a counter-poison. This fact has been established by Dr. Fraser in a communication to the royal society of Edinburgh, embracing the results of 500 experiments on dogs and rabbits. So unmistakable is the power of the antidote, that it can prevent even three times a fatal dose of the kernel from causing death in those animals. Belladonna has also an opposite action on the eye to that of this substance, as it dilates the pupils and produces long-sightedness. When the pupil is contracted by Calabar bean, it may be dilated to its normal, or to a greater, size by belladonna; and when it is dilated by belladonna, it may be reduced to its normal, or to a less, size by Calabar bean.

CALABASH TREE, *Oreocentia cujete*, a tree found in the West Indies and in the

tropical parts of America, of the natural order *bignoniaceæ* (q. v.) suborder *crestiaceæ*. In height and size it resembles an apple-tree, and has wedge-shaped leaves, large whitish fleshy flowers scattered over the trunk and older branches, and a gourd-like fruit, sometimes a foot in diameter. The wood of the tree is tough and flexible, and is well adapted for coach-making. But the most useful part is the hard shell of the fruit, which, under the name of *calabash*, is much used in place of bottles for holding liquids, and for goblets, cups, water-cans, etc. These shells may even be used as kettles for boiling liquids, and they will bear this several times without being destroyed. They are sometimes highly polished, carved with figures, tinged with various colors, and converted into ornamental vessels. The rinds of gourds are sometimes similarly used, and called calabashes.

CA'LABA TREE. See CALOPHYLLUM.

CALABO'ZO, a t. in Venezuela, 120 m. s. s. w. of Caracas, in the plain w. of the river Guarico; pop. 6000. It is an important point for commerce, but is subject to inundations and extremes of heat. The town has a college and a number of schools.

CALA'BRIA, the s. w. peninsula of the kingdom of Italy, bounded n. by the province of Basilicata. Its greatest length, from the southern border of Basilicata to cape Spartivento, is about 160 miles. In its northern part it has a breadth in some places of more than 60 m., which suddenly contracts, between the gulfs of Sant' Eufemia and Squillace, to not more than 16. Its entire area is nearly 7000 sq. m., and its pop., in 1871, amounted to 1,206,802. It is traversed throughout its entire length by the Apennine mountains (q. v.), whose summits in the region in the n. of C., known as La Sila, and the Aspromonte, in the s., are crowned with pines, while forests of oak and beech cover their sides. The valleys between the various hills afford rich pasture, especially in the n., to which, in spring-time, whole colonies migrate with their flocks and herds. There is no river of any importance in C.; but the valleys and plains, watered by such streams as there are, are very fertile, yielding wheat, rice, cotton, licorice, saffron, the sugar-cane, etc., and also the vine, orange, lemon, olive, fig, and mulberry, in luxuriance. Iron, alabaster, marble, gypsum, and antimony are among its minerals. The fisheries of its coasts, particularly the tunny and anchovy fisheries, are important, and afford employment to a large number of the population. Manufactures are in a backward state. Silk is the staple article. The district is very subject to earthquakes. For purposes of administration, C. is divided into the provinces of Cosenza, which has a population of 440,468—capital, Cosenza; Catanzaro, with a population of 412,226—capital, Catanzaro; and Reggio, with a population of 353,608—capital, Reggio.

In ancient times, the name C. was given to the s. e. peninsula, nearly corresponding to the modern province of Lecce, no portion of which is included in modern C., which answers to the ancient *Bruttium*. The name C., as applied to the district now known by that name, appears to have originated with the Byzantines some time prior to the conquest of the country by the Normans. A colony of the Vaudois or Waldenses of Piedmont was founded in C. in 1340, and for some time enjoyed great prosperity, but was extirpated in 1560-61. The destruction of this colony is one of the blackest passages of the history of religion in Italy.

The Calabrians are a proud, fiery, and revengeful race. They were long celebrated as among the fiercest of banditti; but the crimes which in former times made them infamous are no longer frequent. They strenuously resisted the power of France during the Napoleonic campaigns, and were not finally subdued until 1810.

CALA'DIUM. See Cocco.

CALAHOR'RA, a t. in Spain in the province of Logroño, 24 m. s. e. of the city of that name, is situated on the small river Cidacos, about 2 m. from its confluence with the Ebro. C. occupies the site of the ancient *Calagurris*, celebrated in classic history for the obstinate but unsuccessful resistance it offered (78 B. C.) to Afranius, Pompey's legate, when the citizens slaughtered their wives and children for food rather than surrender. C. was the birthplace of Quintilian the rhetorician. It has an old cathedral, and a trade in the agricultural produce of the rich district in which it is situated. Pop. about 7000.

CALAIS, a city and port of entry in Washington co., Me., on St. Croix river at the head of tide water, and opposite to St. Stephen in New Brunswick; the most north-easterly seaport in the United States; 75 m. n. e. of Bangor; pop. '70, 5944. The river is crossed by several bridges, and the New Brunswick and Canada railroad touches at St. Stephen. The St. Croix and Penobscot railroad from C. to Bangor is partially built. There is a tide at C. varying from 20 to 30 ft. and steamers of the largest size come and go freely. The St. Croix also furnishes abundant water-power, to which is due the great lumber trade of the city. Nearly 100 mills are engaged in making boards, laths, shingles, etc. Ship-building is also an extensive business, and there are founderies, machine shops, and dry dock, flour mills, and many other branches of mechanical industry. Among the chief buildings are a city hall, an opera house, and a dozen churches. The city was nearly destroyed by fire in Aug., 1870, since which time it has been rebuilt in a more substantial manner.

CALAIS, a seaport t. of France, in the department of the Pas-de-Calais, on the strait of Dover, near its narrowest part, the distance from the town of Dover not being more

than 26 miles. There is here a lighthouse 190 ft. high. In 1879, it was determined to encircle C. with vast new fortifications, and make it once more a fortress of the first class. On the s. and e., low marshy grounds, which those in the city have the means of submerging, stretch up almost to the walls. The town, adjacent country, and port are commanded by the citadel, which is situated at the w. end of the town, while numerous forts, by their cross-fire, defend the weakest points. The harbor, which is nearly dry at low tide, and which has rarely more than from 15 ft. to 18 ft. of water in it, is formed by two moles, which project about three quarters of a mile into the sea. Being one of the chief ports of debarkation for travelers from England to France, it has daily steam communication with Dover—with which it is also connected by submarine telegraph—and with London and Ramsgate several times a week. The city, which is entered from the sea by a drawbridge and gate, erected in 1685 by cardinal Richelieu, is square in form; its streets are, for the most part, broad and well paved; and its ramparts form pleasant promenades. But it is on the whole a dull place. It has few objects of interest, the most noticeable being the cathedral, with a fine picture of the "Assumption" by Vandyck. It has become a manufacturing town of some importance. The chief manufactures are bobbin-net (tulle) and hosiery. Numerous mills have been built; steam-engines are multiplying; and the inner ramparts have been removed to make room for factories. Hats and gloves are extensively made. It has also distilleries, salt refineries, and shipbuilding. C. sends many boats to fish for herring and cod on the coasts of Scotland and Iceland. Water, which used to be scarce, is now brought in abundance from the neighborhood of Guines. Its exports consist of eggs, corn, wine, brandy, etc. In 1873, a school of artillery was established in C. Pop. 76, 12,573.

In the 9th c., C. was but a small fishing-village. In the following c., it was much improved by Baldwin IV., count of Flanders, and enlarged and strengthened by Philippe of France, count of Bologne. After a long siege, it was captured by Edward III. of England, whose hard terms, and the self-devotion shown by six of the citizens, who were saved by queen Philippa, form one of the most interesting passages of history. The English retained it until 1558, when it was captured by the duke of Guise, since which time (with the exception of two years, 1596-98, when it was in the possession of the Spaniards) it has remained in their hands. In 1659, Charles II. of England resided some time here; and about a quarter of a century later, James II. arrived here with French troops for the invasion of England, which the destruction of the French fleet prevented him from accomplishing. Louis XVIII. landed here in 1814, after his exile.

CALAMANDER WOOD, a cabinet-wood of the greatest value, resembling rose-wood, but much surpassing it in beauty and durability. The tree which produces it is *diospyros hirsuta* (see *DIOSPYROS*), a species of the same genus which produces ebony; it has oblong obtuse leaves, which are downy beneath, and flowers without stalks and crowded; and is a native of the s.e. of India, and of Ceylon, particularly of the forests at the base of Adam's Peak. But this tree "has been so prodigally felled, first by the Dutch and afterwards by the English, without any precaution for planting or production, that it has at last become exceedingly rare," so that wood of considerable size is scarcely to be procured at any price. It yields veneers of unusual beauty, "dark wavings and blotches, almost black, being gracefully disposed over a delicate fawn-colored ground." Its density is very great, a cubic foot weighing nearly 60 lbs., and it takes an exquisite polish. The name C. W. is supposed to be a corruption of coromandel wood.

CAL'AMARY, SQUID, OR SLEEVE-FISH, *Loligo*, a genus of cephalopodous mollusks of the order *dibranchiata*, and family *teuthida*. The body is of an elongated form, firm, fleshy, tapering, and flanked towards its posterior extremity by two triangular fins. The body contains a *gladius*, or internal shell, which is horny and flexible, narrow, and pen-shaped, with the shaft produced in front. The mouth is furnished with eight arms. Calamaries have the power of diffusing a dark-colored fluid around them in the water like the cuttle-fish. The different species are distributed over all parts of the world. Several are found in the British seas. In some seas, however, they abound much more, and form a principal part of the food of some of the larger fishes and of whales. The common C. or squid (*L. vulgaris*) is of a bluish color, speckled with purple. It grows to nearly a foot and a half in length, without reckoning the head and arms, which add to the length about half a foot more. See CEPHALOPODA.

CALAMATTA, LUIGI, 1802-69; b. in Milan; an engraver who became famous by an engraving of the head of Napoleon taken after his death at St. Helena; and also for an engraving of Ary Scheffer's "Francesca da Rimini." His widow, Josephine, is a painter of religious subjects.

CALAM'BUCO, a tree found only in the n. part of the island of Luzon, considered superior to teak or live oak for shipbuilding. It is dark and hard, like teak, and is proof against the destructive white ant of the Malay region. Warlike, mechanical, and agricultural tools and implements are made from it. The same name applies to the tree that furnishes the eagle-wood and aloes-wood of commerce, found in Siam and Sumatra. The resin which it yields, is supposed to be produced by some disease in the tree, and is used in eastern countries for incense.

CALAMIA NÉS, a group of islands in the Eastern archipelago, in lat. about 11° 25' to 12° 20' n., and long. 120° east. Calamianes, the name of the largest of the group, is

about 35 m. long, and 15 m. broad, elevated and fertile, with abundance of animals, such as deer and hogs. The group, with the northern part of Palawan, forms the Spanish province of C., the poorest in the Philippines.

CALAMICHTHYS, a cylindrical and extremely slender ganoid fish in the waters of w. Africa, allied to the polypterus of the Nile.

CALAMINE, an ore consisting essentially of carbonate of zinc. The name is said to be derived from the Greek and Latin *calamus*, a reed, because when fused it adheres to the base of the furnace in a reed-like form. Its primary form is a rhomboid, and it occurs in small obtuse-edged crystals, also compact and massive. It is white, yellowish-white, brown, green, or gray; is sometimes opaque, sometimes translucent; is brittle, and has an uneven conchoidal fracture. It occurs in beds and veins in rocks of various kinds, but most commonly in limestone. Mendip, Matlock, Alston Moor, Leadhills, and Wanlockhead are British localities. C. is an important ore of zinc. In the duchy of Limburg, in the Netherlands, about 1,500,000 lbs. of it are annually extracted from the mines.

CALAMINT, *Calamintha*, a genus of plants of the natural order *labiate*, nearly allied to balm (q.v.) (*melissa*). The COMMON C. (*C. officinalis*, formerly *melissa calamintha*) is not unfrequent in England. It has whorls of flowers (*verticillasters*), on forked many-flowered stalks, and serrated leaves, with an agreeable aromatic odor, not unlike that of some kinds of mint. It is used by the country people to make herb-tea, and as a pectoral medicine.—The LESSER C. (*C. nepeta*), also an English species, is used in the same way.

CALAMIS; 467–429 B.C.; a sculptor of Greece, who made statues in bronze, ivory, gold, and marble; also famous for his representations of horses.

CALAMITE, a genus of fossil plants whose true position has not been satisfactorily ascertained. They appear first in the Devonian rocks, and rise through the intermediate formations to the oolitic series, where they are represented by a single species. They reach their culminating point in the coal-measures, where 39 species have been determined. The tall straight stems rose from a swampy clay soil in profusion in the forests of sigillaria, and formed a striking and characteristic feature in the coal flora, though they supplied little material for the structure of coal. They are hollow-jointed cylinders, with longitudinal furrows, giving the fossil the appearance of *equisetæ*; from this resemblance, botanists have generally considered them as huge "horsetails." Hooker has been unable to detect any traces of structure, in carefully prepared specimens, or the presence of those siliceous stomata which characterize *equisetæ*, and which would have been preserved in the fossil state, and Fleming has shown that the furrows are markings on the interior cavity. While, therefore, it is certain that they are not "horsetails," the absence of fructification makes every attempt to give them their position but guess-work. Hooker supposes them nearly allied to ferns, or club-mosses; Brongniart ranks them among gymnospermous dicotyledons. The upper part of the stem, and the foliage, if any, have not been noticed. The root termination was conical, the joints decreasing downwards in size and length. From the scars on the upper portion of each joint, there proceeded filaments, which were supposed to be leaves, but are really roots. These are shown in the species figured—a species common in the English coal-field.

CALAMUS, the reed pen which the ancients used in writing, was made of the stem of a reed growing in marshy places, probably *arundo donax* (see REED), of which the best were obtained from Egypt. The stem was first softened, then dried, and cut and split with a knife (*scalprum librarium*), as quill pens are made. To this day, the orientals generally write with a reed, which the Arabs also call *kalâm*.

CALAMUS, a genus of palms. See RATTAN and DRAGON'S BLOOD.

CALAMUS, a name sometimes given to the sweet flag (*acorus calamus*). See ACORUS. See also next article.

CALAMUS AROMATICUS, the name given by the ancients to a plant to which they ascribed important medicinal virtues. It is by no means ascertained what the plant is: the most probable opinion appears to be that of Dr. Royle, who supposes it to be one of the sweet-scented grasses which yield the grass-oil (q.v.) of India, to which he has given the name of *andropogon calamus aromaticus*. See LEMON-GRASS. The C. A. of the Greeks and Romans came from the east. The *sweet calamus* and *sweet cane* mentioned in Scripture (Exod. xxx. 23, and Jer. vi. 20) are probably the same with the *calamus aromaticus*.

CALAMY, EDMUND, an eminent English divine, was b. in London, 1600; studied at Pembroke hall, Cambridge, where he attached himself to the Calvinistic party; and afterwards became domestic chaplain to the bishop of Ely. In 1626, he was appointed lecturer at Bury St. Edmunds, but resigned his office when the order to read the *Book of Sports* began to be enforced. In 1639, he was chosen minister of St. Mary's, Aldermanbury, London. He now entered warmly into the controversies of the time, and became noted as a leading man on the side of the Presbyterians. He had a principal share in the composition of *Smectymnus*, a work intended as a reply to bishop Hall's

Divine Right of Episcopacy, and one of the most able and popular polemics of the day. Like the mass of the Presbyterian clergy, he was monarchical and not republican in his political opinions. He disapproved, therefore, of the execution of Charles, and the protectorate of Cromwell, and did not hesitate to avow his attachment to the royal cause. He was one of the deputies appointed to meet Charles II. in Holland, and congratulate him on his restoration. His services were recognized by the offer of a bishopric, which he refused from conscientious scruples. The increasing tyranny and intolerance of the high church party compelled him give up even his royal chaplaincy. He died Oct. 29, 1666.—Two of his sons were educated for a religious profession: the one, Dr. BENJAMIN C., became a high churchman, and wrote *A Discourse against a Scrupulous Conscience*; the other, EDMUND C., was ejected for non-conformity, and had a son, also named Edmund, who acquired some reputation as the biographer of the ejected clergy.

CALAMY, EDMUND, D.D., 1671–1732; an English non-conformist clergyman, who arranged for the press *Baxter's Life and Times*, and wrote *Defense of Modern Non-conformity*; *The Non-conformists' Memorial*; and published many sermons.

CALAND, or KALAND, a brotherhood of Roman Catholics devoted to charitable and devotional works, dating from the 13th c., and of considerable extent in Germany, Switzerland, and France. It degenerated so far that it was suppressed before the reformation, its property being confiscated for public purposes.

CALAND, PIETER, b. Holland, 1826; an engineer, and son of an engineer; author of works on encroachments of the sea, and the effect of the sea on rivers; but better known for his improvements in the communication of Rotterdam with the ocean, whereby he replaced a tortuous and difficult route by one easy and direct.

CALANDO, in music, an Italian expression, meaning diminishing by degrees from forte to piano; it differs from the decrescendo or diminuendo, as the tempo, at the same time, is slightly retarded, but not so much as in ritardando. The proper performance of the C. is purely a matter of good taste and feeling, depending on the performer.

CALANDRA. See CORN WEEVIL.

CALANDRONÉ', a wind-instrument used by the Italian peasants, on which they play simple melodies, and also sometimes accompany their national songs. It has the holes of the common flute, but the intonation is produced as in the common pipe.

CALANUS, a Hindu philosopher, whose real name, according to Plutarch, was Sphines. He was for some time in the camp of Alexander the great, but having become seriously ill, he was burned alive at his own request.

CALAS, JEAN, a Frenchman, remembered as the unhappy victim of fanaticism and the shocking maladministration of justice, was b. at Lacaparrède, in Languedoc, Mar. 19, 1698. He lived as a tradesman in Toulouse, where he had a very good reputation. One evening after supper (Oct. 13, 1761), the eldest son of the C. family, Marc Antoine, a youth addicted to gambling, and subject to fits of deep melancholy, was found hanged in the warehouse. There was not a shadow of a reason for doubting that the unhappy young man had committed suicide; but popular rumor accused the father, or other members of the C. family, of murdering the eldest son, "because he had contemplated conversion to Catholicism." It was also asserted that a young man named Lavaysse, who was in the house on the fatal evening, had been dispatched "by the Protestants of Guyenne to perpetrate the murder." The clergy exerted all their influence to confirm the populace in their delusion. At Toulouse, the White Penitents celebrated with great solemnity the funeral of the young man, and the Dominican monks erected a scaffold and placed upon it a skeleton, holding in one hand a wreath of palms, and in the other an abjuration of Protestantism. The family of C. was, in consequence of the popular excitement, brought to trial for the murder, and several deluded and (most probably) some bribed witnesses appeared against them. A Catholic servant-maid, and the young man Lavaysse, were also implicated in the accusation. C., in his defense, insisted on his uniform kindness to all his children; reminded the court that he had not only allowed another of his sons to become a Catholic, but had also paid an annual sum for his maintenance since his conversion. He also argued from his own infirmity that he could not have prevailed over a strong young man, and referred to the well-known melancholy moods of the deceased as likely to lead to suicide; and, lastly, he pointed out the improbability that the Catholic servant-maid would assist in such a murder. But all his arguments proved unavailing, and the parliament of Toulouse sentenced the wretched man—by a majority of 8 votes against 5—to torture and death on the wheel! With great firmness and protestations of his innocence to the last, the old man died on the wheel, Mar. 9, 1762. His property was confiscated. His youngest son was banished for life from France, but was captured by the monks, and compelled to abjure Protestantism. The daughters were sent to a convent. The young man Lavaysse was acquitted, and the widow of C. escaped into Switzerland, where she was so fortunate as to excite the benevolent interest of Voltaire, who brought the whole affair before the public, and, in his book *Sur la Tolérance*, proved that C. had fallen a victim to religious hatred and popular fanaticism. A revision of the trial followed, and, after

full investigation, the parliament at Paris declared (Mar. 9, 1765) C. and all his family innocent. Louis XV. gave to the bereaved family the sum of 30,000 livres; but, strange to say, neither the parliament of Toulouse nor the fanatical monks were ever brought to account for this horrible judicial murder!

CALASA'YA BARK. See CINCHONA.

CALASCIBET TA, or **CALATAS-CIBETTA** (Saracenic = Castle of Xibeth, or Seibet), a t. of Sicily, near its center, 54 m. s.e. of Palermo, in the province of Caltanisetta. The town is mean and dismal looking, and is built on a steep and isolated height, the summit of which is 2570 ft. above the sea, and commands a magnificent view. It was founded in 1080. The only object worthy of notice is the tower of the principal church, which is of early architecture. Pop. 5600.

CALASIA'O, a t. on the island of Luzon (Philippines), with a population of 18,000, who are engaged in the manufacture of straw hats, cigar cases, etc.

CALA'SIO, **MARIO DE**, 1550-1620; an Italian scholar, doctor of theology and professor of Hebrew in Rome, who made a Hebrew dictionary and grammar. He devoted 40 years of his life to a great work called *Concordantiæ Sacrorum Bibliorum Hebraicæ*, which was published after his death.

CALASPARRA, a t. of Spain, in the province of Murcia, 40 m. n.w. of the city of that name. The inhabitants, numbering 5275, are chiefly engaged in agricultural pursuits.

CALATABELLO TA, a t. of Sicily, in the province of Girgenti, and 27 m. n.w. of the city of that name. In the immediate vicinity is the site of the ancient *Troicula*, the chief fortress of the insurgents in the second Servile war, 103 to 100 B.C. Pop. about 6000.

CALATAFIMI, a t. of Sicily, in the province of Trapani, situated 8 m. s.w. of Alcamo, in a very fertile district. It is ill-built, and has a ruinous old Saracenic castle, Kalat-al-Fimi, from which it derives its name. There is a remarkable Mosaic altar in the church of Santa Croce. Here, in 1860, Garibaldi's troops defeated the Neapolitan soldiers. Pop. 9500.

CALATAGIRONE', or **CALTAGIROXE'**, a city of Sicily, in the province, and 34 m. s.w. of the city, of Catania. It is well built, with wide streets, and has the fame of great wealth. It has manufactures of cotton fabrics and pottery. Pop. '72, 25,978.

CALATANAZOR', a t. of Aragon, Spain, about 10 m. s.w. of Soria. It is celebrated for a great victory over the Christians obtained by Al-Mansur in 1001. Pop. 1500.

CALATAYUD', a city of Aragon, Spain, situated on the Jalon, near its junction with the Jiloca, about 48 m. s.w. of Saragossa. It is built at the base of two rocky ridges, and out of the ruins of ancient *Bulbâis*, which lay about 2 m. to the east. The city is divided into a new and old portion, the former of which is composed of mean old buildings. The latter has some good streets and handsome squares. C. has a noble old castle, and among its other most noteworthy public edifices are the two collegiate churches and the Dominican convent. In the neighborhood are some curious stalactitical caves. It has manufactures of linen and hempen fabrics, woolens, paper, leather, etc., and a trade in agricultural produce. Pop. 11,037.

CALATRA VA, an order of knighthood in Spain, instituted at Calatrava (q.v.). The statutes of the order, framed by the chapter-general of the Cistercian monks, were sanctioned by the bishop of Toledo in 1164, and afterwards by the pope. At subsequent periods, many privileges were added. After the death of the king, their patron, some of the knights were no longer willing to obey the abbot, and they consequently separated themselves from the monks, and elected a grand-master, Don Garcias de Redon. At a later period, they again united themselves to the Cistercians, after they had gained rich possessions from the Moors both in Spain and Portugal. When Castile had fallen into anarchy, and the other kingdoms were exhausting themselves by internal feuds, the war against the unbelievers was almost entirely carried on by the knights of Calatrava. Their almost uniform success, however, gave rise to rashness; the knights were defeated by emir Jacob ben Yuseff, nearly all of them perished, and Calatrava was occupied by the Moors. After this disaster, the knights transferred their seat to the castle of Salvatierra, by the name of which they passed for a long time afterwards. A truce of 12 years having been concluded, during which the order revived, the knights were able, at the battle of Las Navas de Tolosa, in 1212, again to turn the tide in favor of the Christians. They then returned to Calatrava. Notwithstanding their splendid achievements, the knights of C. never possessed the vast wealth of their brethren of St. James of Compostella (q.v.), a fact which is probably to be accounted for by their having ceded a part of their conquests to the orders of Alcantara and Aviz. But their grand-masters, who were chosen from the highest families in Spain, were very powerful, and exercised a vast influence on public affairs. They did not, however, escape the jealousy of the crown. Two of them were accused of treason, and died on the scaffold; and on the death of the 13th grand-master, in 1489, the administration of the order was transferred to the king by a bull of pope Innocent VIII. By way of compensation for the loss of their independence, the knights were permitted to marry once, though they were still bound to

make vows of poverty, obedience, and conjugal chastity; and latterly to profess belief in the immaculate conception. Their original costume consisted of a coat of white mail, with a white scapulary, a black cap, and a pilgrim's hood; but this dress the anti-pope Benedict XIII., in 1397, granted them permission to exchange for a civil apparel. Their present costume is a white mantle, with a red cross cut out in the form of lilies upon the left breast; while the cross of the order has the same symbol on a silver ground. Two convents for nuns were attached to the order, and were at one time richly endowed. The nuns, attached to the order of C. in 1519, wore the dress of Cistercian nuns, with the cross of the order on the left side of the capuch, fastened to the scapulary.

CALATRAVA LA VIEGA, a ruined city of Spain, situated on the Guadiana, about 12 m. n.e. of Ciudad Real. In the middle ages it was a strongly fortified place, but nothing now remains but a single tower. Its defense against the Moors, undertaken by Raymond, abbot of Fitero, and Diego Velasquez in 1158, after it had been abandoned by the Templars, is famous on account of its having originated the order of the knights of Calatrava, long one of the most honorable in Spain. The town was called C. la Viega, or Old Calatrava, in order to distinguish it from the convent of the knights of the order of Calatrava, erected in the neighborhood in 1214, and which was called Calatrava la Nueva.

CALAVERAS, a co. in n. California, on the Calaveras, Stanislaus, and Mokelumne rivers, and the Stockton and Copperopolis railroad; 936 sq.m.; pop. '70, 8895—1441 Chinese. Gold and copper mining are the leading occupations, with agriculture. The grove of big trees is in this county. Co. seat, San Andreas.

CALAVERAS, a river in n. California, running from the Sierra Nevada w. to the San Joaquin, on the border of Sacramento county.

CALBURGA, a t. of the Nizam's dominions in Hindustan, about 110 m. to the w. of Hyderabad. It stands on a tributary of the Beemah, which is itself a tributary of the Kistna or Krishna. It has been successively the capital of Hindu and Mohammedan sovereignties.

CALCAIRE GROSSIER (Fr. "coarse limestone"), the French representative of the Bracklesham cocene beds. It consists of compact limestones, with seams of chert, and intercalated marls and freestones. The fossils are fresh water and marine mollusca; so abundant are they that in one spot near Grignon no less than 400 distinct species have been procured. Associated with the fresh-water remains are the bones of reptiles and mammalia.

CALCAIRE SILICEUX (Fr. "siliceous limestone") is the French representative of the Bembridge eocene strata. These compact siliceous limestones extend over a wide area in the Paris basin. The few fossils they contain are fresh water and land shells.

CALCAREOUS, in chemistry, is a term applied to substances containing much lime (Lat. *calx*). Thus, *C. waters* are those which hold in solution much carbonate and sulphate of lime, and which are generally known as hard waters, and form a deposit in kettles and other vessels when heated therein. *C. rocks* are those in which lime forms the prevailing element. They may be chemically formed as in the case of tufas, where a saturated solution of carbonate of lime in water is deposited from evaporation or other causes; but they are generally aqueous rocks, the materials of which are supplied by animal remains. Thus, many rocks, like the mountain-limestone, are composed of shells, corals, and encrinurites; while others, like chalk, consist of foraminifera and fragments of other minute testacea. A crystalline structure, varying in degree from the partially crystallized carboniferous limestones to the saccharine statuary marble, is produced in calcareous rocks by metamorphic action. Oolite is a variety of limestone composed of small egg-like grains resembling the roe of fish. The existence of lime in rocks can always be detected by the application of dilute nitric or muriatic acid, when it effervesces from the liberation of the carbonic acid. Pure lime is obtained from calcareous rocks by calcining them—i.e., by driving off the carbonic acid and other volatile matter by heat.—*C. soils* are produced from the disintegration of calcareous rocks. When the rocks are perfectly pure, they generally yield barren soils, as in many chalk and limestone districts of Britain; but when the lime is mixed with clay, so as to form marl, and has a little vegetable matter added, it forms an excellent though rather light soil. Calcareous soils are difficult of drainage, owing to the property that soft lime has of retaining water, although it easily yields it up by evaporation. Such soils are consequently soon dry at the surface after rain, but yet rarely suffer severely from drought.

CALCAREOUS SPAR, or **CALC-SPAR**, the name usually given by mineralogists to carbonate of lime, rhombohedral in its crystallization. It differs from arragonite only in crystallization. See **ARRAGONITE**. C. S. occurs in all geological formations, and is one of the most abundant of all minerals. It often completely fills cavities in rocks; and although it has been prevented by want of space from assuming a crystalline form is readily divided by the knife and hammer into rhomboids, the primary form of its crystals being a rhomboid, of which the greatest angles are 105° 5'. Its secondary forms are more numerous than those of any other mineral. More than 700 have been observed. One of the most common, a rather elongated pyramid, is sometimes called *dog-tooth spar*.

C. S. is colorless and transparent, except in consequence of impurities which may be present in it; and when perfectly transparent, it exhibits in a high degree the property of double refraction of light, which was first discovered in it by Bartholinus. The presence of foreign substances frequently renders C. S. gray, blue, green, yellow, red, brown, or even black.

The name *Iceland spar* has often been given to C. S., at least to the finest colorless and transparent variety, because it is found in Iceland, massive in trap-rock. *Slate spar* is a lamellar variety, often with a shining, pearly luster, and a greasy feel, of which Wicklow in Ireland, and Glen Tilt in Scotland are localities.

CALCAREOUS SPRINGS, springs charged with calcareous matter which is deposited in the form of incrustations. Such deposit is called calcareous tufa, and takes the form of other substances inclosed, such as leaves, twigs, and branches of trees. When freshly quarried it is easily shaped, and is therefore convenient for building. The temples of Paestum are of this material, and the stone has acquired great solidity and strength. In central New York such deposits are common, forming the marl below swamps and in the bottoms of ponds. One of these springs at Clermont, France, has formed a deposit of white concretionary limestone 240 ft. long, 16 high, and 12 wide.

CALCAREOUS TUFFA, **CALC-TUFF**, or **TUFACEOUS LIMESTONE**, a mineral which in its chemical composition is nearly identical with limestone and marble; but is distinguished by its spongy and cellular structure. It is generally rather soft, brittle, and friable, but sometimes it is sufficiently hard to be used as a building-stone. The *travertino*, used for building at Rome, is a hard calcareous tufa. The color of C. T. is generally yellowish-gray, sometimes yellow or yellowish-brown. It occurs massive, or assumes many uncrystalline forms, as tubular, botryoidal (like clusters of grapes), cellular, etc. Sometimes it incrusts animal and vegetable remains. It is frequent in the neighborhood of calcareous springs. It is sometimes used as a filtering-stone.

CALCAR, or **KALCKER**, **JOHN DE**, 1499-1546; a painter, disciple of Titian at Venice, and perfected by studying Raphael; so good an imitator of Titian that his works can scarcely be distinguished from those of that master. One of his pieces is a "Nativity" representing angels around the infant Savior, so arranged that the light by which they are seen comes wholly from the child.

CALCASIEU, a parish in s. w. Louisiana, on the gulf of Mexico and Texan border; 5000 sq. m.; pop. '70, 6733-1457 colored; in '80, 12,381. The surface is level in broad savannahs, and the soil very productive in corn, sugar, molasses, and cotton. Chief town, Lake Charles Court-house.

CALCASIEU, a river in Louisiana, about 200 m. long, running into the gulf of Mexico. Near its mouth is a broad expansion called C. lake. The river is not navigable.

CALCEDONY. See **CHALCEDONY**.

CALCEOLARIA (Lat. *calceolus*, a little shoe), a genus of plants of the natural order *scrophulariaceae* (q. v.), of which there are numerous species, natives of South America, chiefly of that part of the Andes which is more than 9600 ft. above the sea, a few of them reaching almost to the utmost limits of vegetation; although some are found in lower and warmer situations, and some in the southern extremity of the American continent. They abound so much in some parts of Chili and Peru, as to give a peculiar aspect to the landscape. The calyx in this genus is 4-partite; the corolla, 2-lipped; the lower lip remarkably inflated, so as to form a bag; and the shape of the whole in some species considerably resembling that of a slipper. There are only two fertile stamens, and the capsule is semi-bivalvular with bifid valves. Some of the species are shrubby, some herbaceous, almost all the herbaceous species being perennial. Many of them have corymbs of numerous showy flowers. Yellow is the color which chiefly prevails in the flowers of the original species, and next to it purple; but the art of the gardener has succeeded in producing varieties and hybrids which exhibit many other rich and delicate tints. Calceolarias have been florists' flowers since about 1830, the curious appearance of the flowers combining with their beauty to render them attractive, and in no genus is the production of hybrids more easily or frequently effected. They are easily propagated by cuttings. Few plants require more liberal supplies of water. They are generally treated in Britain as half-hardy or as greenhouse plants.—Some of the species are used in South America for dyeing. The roots of *C. arachnoidea*, a parent of many of the hybrids in our gardens, are largely employed in Chili, under the name of *relbum*, for dyeing woolen cloths crimson.

CALCHAS, a Greek soothsayer in the time of the Trojan war who foretold the length of the siege, and when the fleet was detained at Aulis by adverse winds, demanded the sacrifice of Iphigenia. He is said to have died from vexation on being surpassed in prophecy by another soothsayer called Mopsus.

CALCINATION, or **CALCINING** (see **CALX**), is the process of heating or roasting in furnaces or in heaps the various metallic ores. It is resorted to as the first stage in the extraction of the majority of the common metals from their ores, and is essentially a process of oxidation.

CALCIUM is the metal present in chalk, stucco, and other compounds of lime. It may be obtained by passing a powerful current of voltaic electricity through fused chloride of C. (CaCl), when the metal separates in minute globules. It is a yellowish-white metal, can be rolled into sheets, and hammered into leaves, and is intermediate between lead and gold in hardness. It is represented by the symbol Ca, has the atomic weight or equivalent 30 (new system, 40), and has the density 1.578, or nearly half as heavy again as water. At ordinary temperatures, it slowly tarnishes by oxidation; and when placed in contact with water, it rapidly decomposes the water (H₂O), forming lime (CaO), whilst hydrogen escapes. To be retained bright, C. must be kept under the surface of naphtha. At a red heat, it melts and burns with a dazzling white light, accompanied by scintillations. See **LIME**.

CALCOTT, Sir AUGUSTUS WALL, R.A., a distinguished English landscape painter, was b. at Kensington, London, in 1779. In 1803, he devoted himself to landscape painting; in 1810, he was made a member of the royal academy; was knighted in 1837; and in 1844, made conservator of royal pictures. His landscapes are remarkable for their beauty, clear definition of objects, good drawing, and truthful natural coloring. He has been called the English Claude, a designation to which he is not altogether unentitled. He died Nov., 1844.

CALCOTT, JOHN WALL, a distinguished musical composer, elder brother of the above, was b. at Kensington, 1766. Too nervous to be a surgeon, for which he was intended, he devoted his attention to music, and in 1785 won three of the four gold medals annually given by the Catch club, the admired *O Sovereign of the Willing Soul* being one of the successful pieces. During the next ten years, he obtained twenty of the medals given by the same society. In 1785, he was made bachelor, and five years afterwards, doctor of music at Oxford. In 1805, he published his *Musical Grammar*; in the following year his mind gave way under the continuous strain to which it had been subject. He recovered again, but only for three years, when he relapsed, and continued insane until his death in May, 1821. He was one of the most eminent composers belonging to the British school of music, and especially celebrated for his glee compositions. His choicest productions were published in two volumes by his son-in-law, Mr. Horsley, in 1824.

CALCRAFT, WILLIAM, d. 1879; the official executioner or hangman of London; a person of quiet and even gentle manners, who was looked upon by the ignorant as some fearful being quite out of the natural order of humanity. As public executions were stopped in 1860 his fame declined, and little was heard of him except through the exaggerated reports of the ignorant. The price for hanging is fixed in Britain at 14s. 6d., of which 7s. 6d. is the fee, 4s. 6d. for stripping the body, and 2s. 6d. for the use of the shell (coffin). C. received that price regularly; he made much more by traveling expenses, perquisites, etc. He died in financially comfortable circumstances. Bull, (prenomen unknown), the first English hangman whose name survives, lived in the 16th century. The first person hanged in England was Maurice, a nobleman's son. He was executed in 1241, for piracy. Before C., Jack Ketch was the most famous of executioners. He executed, among others, lord William Russell and the duke of Monmouth. C. had retired from office some years before his death on account of advancing age.

CALC-SINTER, a mineral, chemically identical with the purest marble and calcareous spar, but peculiarly characterized by its fibrous structure. It is formed from water holding carbonate of lime in solution, and occurs generally incrusting the roofs, walls, and floors of caves, particularly those in limestone rocks; often assuming curious and even fantastic forms. Macalister's cave, in the isle of Skye, and the limestone caves of Derbyshire, are the most celebrated British localities. But the stalactitic cave of Antiparos, in the Grecian archipelago, is a far more famous locality for this mineral, which is often called *calcareous alabaster*, and used for the same purposes with the true alabaster (q.v.), to which it is in some respects preferable, particularly as not being liable to injury from exposure to the air. Volterra, in Tuscany, is another very famous locality for calc-sinter.

CALCULATING MACHINE. The most remarkable application hitherto made of machinery, is perhaps that through which it has been used to relieve the scientific inquirer to a very great extent of the fatigue of manipulating figures, which consumes so much of his time and energies. Various machines have been constructed for this purpose, differing in the extent of their faculties—to use words more suitable to thinking—than to engines—and somewhat in the principles of their construction. By the *arithmometer*, for instance, a machine invented by M. Thomas of Colmar, all ordinary arithmetical operations are executed without fatigue to the operator; and by a machine contrived by M. M. Scheutz, which rests on the principle of *differences* (q.v.), on the turning of a wheel, the successive terms of any series whose law may be confided to it, are produced—the machine at the same time *printing* a large proportion of its results, and thus providing for the accuracy of its tables. It is a fact of which the nation should be proud, that our countryman, Mr. Babbage, is universally acknowledged as the instigating and guiding genius in the progress of these remarkable inventions. Among his inventions was a *difference engine*, of very comprehensive powers, indeed

capable of managing series so complex that the differences of its terms do not reach zero until we ascend to the seventh order (*vide art. DIFFERENCES, CALCULUS OF*). An immense range of nautical and astronomical tables lie within the limits just defined; and the machine further tabulates approximately any series whatever that can be treated by the *method of differences*. While engaged in constructing the *difference machine*, Mr. Babbage, probably through his increased experience of the capabilities of machinery, was led to form a new conception—that, namely, of the *analytical machine*. He actually succeeded so far as to devise the means of making his machine perform all the elementary operations of addition, subtraction, multiplication, and division; and it is clear that all changes that can be produced on quantity are merely combinations of these. If, then, he could but have made his machine perform these operations at command, and according to any special order, it could have clearly developed any function whatever whose law is ascertained and fixed. A solution of this difficulty was suggested by the Jacquard loom (q.v.), in which the *cards* oblige a machine capable of working *any* pattern to work out one particular pattern; and Mr. Babbage having succeeded so far as to form a machine capable of executing any development, expected, by means of *cards of operations*, to compel his C. M. to work according to one fixed law, and no other. Government, however, did not see its way to make the further grants required for this machine, and at Mr. Babbage's death in 1871, nothing further had been done towards its completion. The *difference machine* is now lying, an unfinished curiosity, in the museum of King's college, London. Both machines will be found described in the third volume of Taylor's *Scientific Memoirs*. The *difference engine*, constructed by Grant for the university of Pennsylvania, is said to be less expensive than Babbage's, and less complicated than Scheutz's, though provided like it with an apparatus for printing the results.

CALCULUS, or **STONE** (in medicine), a hard concretion formed within the animal body, in consequence of the deposition in the solid form of matters which usually remain in solution. See **CONCRETION**. The concretions most commonly termed calculi are those formed in the kidneys or bladder (*urinary C.*); and those formed in the gall-bladder or biliary ducts (*biliary C.*). Both of these give rise to very painful symptoms, and may even threaten life.

Biliary C., or *gall-stone*, may generally be presumed to exist when excessively severe pain suddenly arises in the right side beneath the border of the ribs, and when in a few hours jaundice comes on, showing that some obstruction has existed to the outward flow of the bile. But the absolute proof that these symptoms depend on C. is often wanting. The pain is fortunately transitory, but is more severe while it lasts than almost any other known form of suffering, unless it be that of a C. in the kidney and ureter. It may be relieved by large doses of opium, but the remedy requires to be cautiously given, as even in medical hands fatal accidents have occurred. Gall-stones, when impacted in the ducts, sometimes have proved fatal; but much more frequently they find their way, sooner or later, into the intestines. They are almost invariably composed of cholesterine (q.v.), with coloring matter and mucus, arranged in layers in a semi-crystalline disposition.

Urinary C. is a disease of all ages, but most common in advanced life and in the male sex. It is also very frequent in gouty persons, or among those who pursue sedentary occupations and live freely. It is rare among those who live much in the open air, or who take much violent exercise, and use little animal food and wine. Among sailors, it is peculiarly rare. In certain parts of the country, the disease is said to be frequent, as in Norfolk, and perhaps along the e. coast of Scotland. In India, too, where some of the predisposing circumstances mentioned above can hardly be said to prevail, stone is by no means uncommon. It would appear, therefore, that the predisposing causes of C. are still very imperfectly understood. In its early stages, the disease usually presents itself in the form of *gravel*, shown by the passage of numerous very small portions of gritty concretions, which may be observed in the urine as a deposit like sand, or like small grains of Cayenne pepper. When such deposits occur frequently, especially if they are present at the time of passing the urine, and not merely after it has cooled, there is reason to apprehend the formation of calculus. If, in these circumstances, there are pains of a dull character in the loins, with occasional twinges of sharper suffering, no time should be lost in seeking medical advice. If a fit of very severe pain should occur in a person for some time affected with gravel, if the urine be bloody, if agonizing twinges, commencing in the loins, sting downwards into the thigh or the groin, it is probable that a stone has already formed in the kidney, and is being displaced towards the bladder. C. in the bladder is at first attended with little suffering, as compared with that caused by the stone in its passage downwards from the kidney; but unless removed or evacuated, the C. is sure to enlarge, and it then becomes the cause of one of the most painful diseases that afflict humanity. The existence of a stone in the bladder, however, should never be taken for granted without a surgical examination, as all the symptoms are deceptive in certain cases. The most striking, and perhaps the most trustworthy evidence of stone in the bladder, apart from the use of the sound (see **LITHOTOMY**), is smarting and burning pain experienced after the bladder has been emptied, together with occasional temporary stoppage in the flow of urine.

The correct appreciation of all the symptoms, however, demands considerable familiarity with such cases.

The discovery of the tendency to urinary C. at an early period of its growth, has been greatly aided by the use of the microscope and of chemical tests. Generally speaking, it may be said that whenever the urine, after standing for a few hours, can be observed to contain more sediment than a very slight cloudiness towards the bottom of the vessel, there is room for careful inquiry into the existence of some derangement of the health. But all sediments are not equally apt to determine C., nor is the treatment of the different kinds of sediment at all similar; care should therefore be taken to determine, from time to time, whether the character of the sediment may have undergone a change, so that the treatment may be adapted accordingly.

The chief varieties of urinary C. are—1. Uric acid (red sand); 2. Urates of ammonia, soda, lime, etc. (brick-dust sediment); 3. Phosphates of ammonia and magnesia, lime, etc.; 4. Oxalate of lime; 5. Carbonate of lime (chiefly in domestic animals); 6. Cystine; 7. Xanthic oxide (a very rare form, discovered by Dr. Marcet). Calculi are frequently found to be composed of numerous successive layers, having a perfectly distinct chemical composition. Urates and phosphates in particular frequently succeed each other, and form what is called an alternating calculus.

When C. has once fairly formed in the urinary passages, it seems probable that no absolute cure exists except the removal of it, if possible, from the body (see LITHOTOMY and LITHOTRITY); but in the stage of gravel, and still more in the earlier stages detected by careful examination of the urine, much may be done to check the tendency to this distressing and dangerous malady. The chief remedies consist in careful regulation of the diet and mode of living, together with the use of solvents adapted to the particular form of deposit found to be habitually present. See URINE.

CALCULUS, THE INFINITESIMAL, otherwise sometimes called the transcendental analysis, is a branch of mathematical science—which commands, by one general method, the most difficult problems in geometry and physics. The merit of the invention of this powerful mathematical instrument has been claimed for Leibnitz, but is undoubtedly due with equal justice to Newton, who laid the foundations for it in that celebrated section of his *Principia*, in which he demonstrates the chief theorems regarding the ultimate values or limits of the ratios of variable quantities. The view of one class of writers is, that these distinguished men invented the C. simultaneously and independently; and it is the fact that Leibnitz's system is unfolded from premises differing somewhat from those of Newton. See FLUXIONS. Another class of writers hold that Newton is the real inventor, and that to Leibnitz no more can be conceded than that he was the first who, using the suggestions of Newton's genius, gave a systematic statement to the principle of the transcendental analysis, and invented its appropriate symbolic language. He had the doctrine of limits before him when he wrote, and did little more than unfold more fully the logic of the processes therein suggested, and exhibit them in algebraical forms.

The infinitesimal C., both in its pure and applied forms, whether of geometry or mechanics, is a branch of the science of number; its symbols are of the same kind, are operated on according to the same laws, and lead to analogous results. It differs from the other branches of the science of number, such as arithmetic and algebra, in regarding number as continuous—i.e., as being capable of gradual growth and of infinitesimal increase, whereas they deal with finite and discontinuous numbers. It differs from ordinary algebra in another respect. In the latter, the values of unknown quantities, and their relations with each other, are detected by aid of equations established between these quantities *directly*; in the C., on the other hand, the equations between the quantities are not directly established, but are obtained by means of other equations primarily established, not between them, but certain derivatives from them, or elements of them. This artifice is most fertile, for it can be shown that in the great majority of cases the relations of quantities concerned in any problem may more easily be inferred from equations between these their derivatives or elements than between themselves.

It will be seen that the C. created a new notion of number—as continuous or growing. It is now necessary, in order to a proper conception of it, that a precise idea should be formed of a *differential*. The simplest idea of a differential is unquestionably that got by considering number as made up of infinitesimal elements, and a differential or “infinitesimal” as being the value of the difference between a number at one stage of its growth and as another *very* near it. Every finite number being—in the view of the C. as first conceived by Leibnitz—composed of an infinite number of these infinitesimal elements, certain axioms at once present themselves regarding infinitesimals; as, for instance, “that a finite number of them has no value at all when added to a finite quantity.” Many other such axioms readily follow, from which, on this view, the whole theory of the infinitesimal C. may be constructed. But there are logical objections to this mode of forming the theory of the transcendental analysis, and of three views that have been propounded, that now universally accepted as the most logical, and as being capable of the easiest application, is that founded on the method of limits, already referred to as the invention of Newton. The meaning of a differential on this view will now be explained.

It is clear that the C. can be applied only where numbers may have the continuous character—i. e., where they are or may be conceived as being variable. If two unknown quantities are connected by a single equation only, we clearly have the condition satisfied, as where y and x are connected by the equation

$$(1) \quad y = F(x),$$

where F is a sign denoting some *function* of x , as $\tan. x$, $\cos. x$, x^2 , etc. This equality may be satisfied by innumerable values of y and x . One question which the C. solves is, how does y vary when x varies? To solve it, and, at the same time, show how the doctrine of limits affects the definition of a differential, suppose x , y , and $x + Dx$, $y + Dy$, to be two pairs of values of the variables which satisfy the above equation; then

$$(2) \quad y = F(x), \quad \text{and} \quad (3) \quad y + Dy = F(x + Dx).$$

From (2) and (3) we have, by subtraction,

$$(4) \quad Dy = F(x + Dx) - F(x);$$

whence we have the ratio

$$\frac{Dy}{Dx} = \frac{F(x + Dx) - F(x)}{Dx}.$$

This ratio will generally change in value as Dx and Dy diminish, till, as they both vanish, which they must do simultaneously, it assumes the form $\frac{0}{0}$. Taking this form,

it ceases to have a determinate actual value, and it is necessary to resort to the method of limits, to ascertain the value to which it was approaching, as Dx and Dy approached zero. Let, then, dx and dy be any quantities whose ratio is equal to the limiting ratio of the increments Dx , Dy , so that

$$\frac{dy}{dx} = \text{limit} \frac{Dx}{Dy}$$

as Dx and Dy approach zero. Then dx and dy are the differentials of x and y . It may be observed that where x and y are connected as above, they cannot vary independently of one another. In the case assumed, x has been taken as what is called the *independent* variable, the question being, how does y vary when x varies. If y were made the independent variable, it would be necessary to solve the equation $y = F(x)$, if possible, so as to express x in terms of y . The result would be an equation $x = \varphi(y)$. This being

obtained, we should find $\frac{dx}{dy} = \text{limit} \frac{Dx}{Dy}$ as before. It will be seen that on this view

differentials are defined merely by their ratio to one another. Their actual magnitude is perfectly arbitrary. This, however, does not render an equation involving differentials indeterminate, since their relative magnitude is definite, and since, from the nature of the definition, a differential cannot appear on one side of an equation without another connected with it appearing on the other.

The idea of a differential being once comprehended, the reader will be able to understand, in a general way, the main divisions of the C., which we shall now briefly delineate. So much is clear from what has been stated, that there must be two main divisions—one by which, the primary quantities being known, we may determine their differentials; and another by which, knowing the differentials, we may detect the primary quantities. These divisions constitute the differential C. and integral C. respectively.

1. THE DIFFERENTIAL CALCULUS.—Recurring to the formula already given we know

$$\frac{dy}{dx} = \text{limit} \frac{Dy}{Dx} = \text{limit} \frac{F(x + Dx) - F(x)}{Dx}.$$

It is clear that, in the general case, $\frac{F(x + Dx) - F(x)}{Dx}$ at the limit will still be some

function of x . Calling it $F''(x)$, we have generally $\frac{dy}{dx} = F''(x)$. $F''(x)$ is called the first differential coefficient of y or $F(x)$. Being a function of x , it may be again differentiated. The result is written

$$\frac{d^2y}{dx^2} = F'''(x),$$

$F'''(x)$ being the second differential coefficient of y or $F(x)$; and again $F''''(x)$ may be a function of x , and so capable of differentiation. Now it is the object of the differential C. to show how to obtain the various differentials of those few simple functions of quantity which are recognized in analysis, whether they are presented singly or in any form of combination. Such functions are the sum, difference, product, and quotient of variables, and their powers and roots; exponentials, logarithms; and direct and inverse circular functions. The C. so far is complete as we can differentiate any of those functions or any combination of them—whether the functions be explicit or implicit; and with equal ease we may differentiate them a second or any number of times. This C.

is capable of many interesting applications as to problems of maxima and minima, the tracing of curves, etc., which cannot here be particularly noticed.

2. THE INTEGRAL CALCULUS deals with the inverse of the former problem. The former was: Given $F(x)$, to find $F'(x)$, $F''(x)$, and so on. The present is in the simplest case—viz., that of an explicit function. Given $\frac{dy}{dx} = F'(x)$, to find $F(x)$. The methods

of the integral C., instead of being general, are little better than artifices suited to particular cases; no popular view can be given of these. In many cases, integration is quite impossible. The explanation of *integration by parts*, by *approximation*, *definite integrals*, and *singular solutions*, is far beyond the scope of the present work. The reader is referred to any of the numerous text-books on the subject. The integral C. has applications in almost every branch of mathematical and physical science. It is specially of use in determining the lengths of curved lines, the areas of curved surfaces, and the solid contents of regular solids of whatever form. The whole of the lunar and planetary theories may be described as an application of the integral C., especially of that branch of it which deals with the integration of differential equations. It is applied, too, in hydrostatics and hydrodynamics, and in the sciences of light, sound, and heat. In short, it is an instrument without which most of the leading triumphs in physical science could never have been achieved.

CALCULUS OF VARIATIONS.—The foundation of this C. is a method of differentiation, but of quite a peculiar kind. As above explained, the object of the differential C. is to determine the form which a function, such as $F(x)$, will assume if x receive an indefinitely small increment, such as Dx . In the C. of variations, the object is to ascertain and lay down the laws of the changes supervening on a slight alteration of the *form of the function*, or should $F(x)$ become F^1x . This C. commands with ease a class of problems called problems of isoperimeters, which were formerly insoluble. It has also power over mechanical problems, and many departments of high physics cannot be touched without its aid. Mr. Airy and prof. Jellet have both written works on the subject, which may be consulted.

CALCULUS OF FINITE DIFFERENCES, CALCULUS OF FUNCTIONS.—For brief notices of these growths from the original transcendental analysis, see the articles under the headings DIFFERENCE and FUNCTIONS.

CALCUTTA (*Kali Ghatta*, the ghaut or landing-place of the goddess Kali), the capital of the province of Bengal, and metropolis of British India, is situated on the left bank of the river Hoogly, an arm of the Ganges, in $22^{\circ} 35'$ n. lat., and $88^{\circ} 27'$ e. long., about 100 m. from the sea by the river. C. was founded by governor Charnock in the year 1686, by the removal hither of the factories of the East India company. In 1700, three villages surrounding the factories having been conferred upon the company by the emperor of Delhi, in recognition of a present made to Azim, a son of Aurungzebe, they were forthwith fortified, and received the name of fort William, in honor of the reigning king; but the place was subsequently termed Calcutta, the name of one of the villages. In 1707, C. had acquired some importance as a town, and was made the seat of a presidency. In 1756, however, a great misfortune befell the rising town; it was unexpectedly attacked by Surajah Dowlah, the nawaub of Bengal, and being abandoned by a number of those whose duty it was to defend the place, it was compelled to yield after undergoing a two days' siege. Only 146 men, however, fell into the enemy's hands; but these were treated with heartless cruelty. Cast at night into a confined cell, about 20 ft. square—the notorious "Black Hole" (q. v.)—they endured the most unheard-of sufferings, and in the morning it was found that only 23 out of 146 had survived the horrors of that night. The city remained in the hands of the enemy until eight months afterwards, when Clive arrived in the country from England. In conjunction with admiral Watson, Clive succeeded in recapturing the town, and afterwards concluded a peace with the nawaub. Soon after this, and subsequent to the important victory of Plassey, the possessions of the East India company were greatly extended by means of grants made by the emperor of Delhi, and C. once more resumed its career of progress, and advanced rapidly in prosperity. In 1852, C. was erected into a municipality, the proprietors paying assessments, and erecting commissioners to apply the proceeds of these assessments in cleansing, improving, and embellishing the town. In 1837, the population of the town proper amounted to 229,700; in 1872, it had increased to 447,601, or with Howrah and suburbs, 892,429 (1876, without Howrah, 776,579). Besides these, thousands of the three and a half millions who sleep at night in the surrounding districts of Hoogly and the 24 pergunnahs, flock during the day to C., on foot, by boat, or by railway, to their daily toil. The inhabitants are mostly Hindus; but there is also a good proportion of Mohammedans. About 20,000 are Europeans; 20,000 Eurasians, or the progeny of white fathers with native mothers; and there is a considerable number of Armenians, Greeks, Jews, Parsees, and negroes. The city extends for about 5 m. along the river, and is somewhat less than 2 m. in breadth at its broadest part, the area being about 8 sq. m., and comprised for the most part between the river and the circular road, a spacious roadway which marks the landward boundary of the city proper. Beyond this road there lie extensive suburbs, the chief of which are Chitpore on the n., Nunden Baugh, Bahar-Simleah, Seal-dah, Entally, and Ballygunge on the e., and Bhowanepore, Allipore, and Kidderpore

on the south The villages of Sulkeah, Howra, and Seebpoor are situated on the opposite side of the river, and contain the salt-golahs or warehouses of the government, extensive manufactories, dockyards, and ship-building establishments. The appearance of the city as it is approached by the river is very striking; on the left are the botanical gardens, destroyed by the cyclones of 1867 and 1870, but since replanted, and the bishop's college, a handsome Gothic edifice, erected by the society for the propagation of the gospel in foreign parts; on the right is the suburb of Garden Reach, with its handsome country-seats and beautiful gardens; further on are the government dockyards and the arsenal; beyond these is the Maidan esplanade, which has been termed the Hyde park of India, being the favorite place of resort of the *élite* of C. for their evening drive. Here, near the river, lies fort William, the largest fortress in India, having been constructed at a cost of £2,000,000, and occupying, with the outworks, an area of about half a mile in diameter. It is garrisoned by European and native soldiers, mounts 619 guns, and its armory contains 80,000 stands of small-arms. Facing the esplanade, among other fine buildings, is the government house, a magnificent palace erected by the marquis of Wellesley. Beyond this, extending northwards along the river bank, is the Strand, 2 m. in length, and 40 ft. above low water, with various ghauts or landing-places. It is adorned by many fine buildings, including the custom-house, the new mint, and other government offices, and the appearance given by these and other edifices has gained for C. the appellation of "city of palaces." Among its other places of interest, mention may be made of the Sudder Dewanee Adawlut, the principal court of justice; the town-hall, a fine building; the Bengal club, writers' buildings, bank of Bengal, Jesuits' college, medical college, university, theater, besides various churches, mosques, Hindu temples, and pagodas and numerous bazaars. There are a number of monuments throughout the city, the most noticeable being those erected to the marquis of Wellesley and sir David Ochterlony. Although the European quarter of the town is distinguished for its fine public buildings and commodious dwelling-houses, the quarters occupied by the natives present a very different appearance, their houses being in most instances built of mud or bamboo and mats, and the streets narrow and unpaved. Considerable improvements have, however, been effected of late; new and wider streets have been opened through crowded quarters; brick houses are fast replacing the huts, and an extensive system of drainage has been carried out, to the no small advantage of the inhabitants. The cyclone of Nov., 1867, destroyed 30,000 native houses, and that of June, 1870, was likewise very destructive.

The water supply of C. has recently been very much improved. Formerly, the water was kept in large tanks, interspersed throughout the city, whence it was borne by water-carriers or *balisties* in large leather bags. But within the past five years, a supply of excellent water has been obtained from the Hoogly, about 15 m. above C., where it is filtered and sent down by pipes in the usual way. The result of this has been a marked improvement in the health of the city. Gas has now taken the place of the oil-lamps which were formerly in general use for lighting the streets at night. Tramways have been recently tried in some of the principal streets, but as yet with little success. A canal girds a part of the city beyond the circular road.

The communications of C. afford great facilities for its extensive commerce. There are several lines of railway to various parts of India; the East Indian to Benares, Delhi, and Multan, its present terminus, whence it is to be continued to Kurrachee; the Eastern Bengal, the extension of which to Gulundu was opened in 1871; and the Calcutta and South-eastern to the mouth of the Ganges. The great Indian Peninsula railway branches off from the East Indian, and connects C. with Bombay and Madras. C. is also connected by electric telegraph with the principal towns of India, and can communicate with England by three different lines. Uninterrupted communication is kept up with Great Britain by numerous and well-appointed steamers and sailing-vessels. This intercourse has been greatly facilitated by the opening of the Suez canal. Navigation on the Hooghly is dangerous, owing to the shifting sands; and though much has been attempted, little has been effected in the way of remedying the evil. The river, adjacent to the city, varies in breadth from a quarter of a mile to nearly a mile. Ships of 2000 tons can ascend to Calcutta.

The growth of scientific and literary societies, here and elsewhere in India among the native communities, indicates a degree of progress and intellectual activity very hopeful for the future of India. The principal of these in C. are the Bengal Asiatic society, founded in 1784 by sir W. Jones, possessing a fine library, and a valuable and extensive museum; the Bethune society, for the promotion of intercourse between European and native gentlemen; the Dalhousie institute, for the literary and social improvement of all classes of the community; the Bengal social science association, and others. The university of C. was founded in 1857, on the same basis as the London university, and exercises functions over Bengal, the North-west Provinces, Oude, and the Central Provinces. Colleges have been instituted to prepare intending students. In 1877, of 2425 candidates for admission to the university of C., 1355 passed the required examinations. Other educational institutions are numerous in Calcutta. The principal places for religious instruction are Bishop's college, intended chiefly for the education of missionaries and teachers, and the institutions of the established and free churches of Scotland for the same purpose, all which are ably conducted.

C. may be regarded as the great commercial center of Asia. One third of the whole

trade of India is done here. In 1877, the exports amounted to £26,596,018, exclusive of treasure, and the imports to £16,693,813. The chief exports are jute, cotton, rice, sugar, indigo, coffee, tea, salt-peter, linseed, shellac, buffalo horns, hides, castor-oil, cutch, gunny bags, etc. The jute exported in 1872 was valued at £4,000,000, the indigo at £2,500,000, and the tea at £1,400,000. In the same year 658 sailing-vessels and 301 steamers, with a total tonnage of 999,614, arrived in the Hooghly; and 637 sailing-vessels and 301 steamers, with a total tonnage of 957,523, sailed. The principal industries are sugar refining, cotton manufacturing, flour, saw, and oil mills, and ship-building docks. Several newspapers are published. There are a few banks and numerous insurance and other companies, with a chamber of commerce. Living is comparatively cheap, and most of the luxuries of life, as well as its necessaries, are to be had in the unpretentious shops of C. as readily as in most European towns. The annual fall of rain averages 64 in.; the temperature in the shade ranges in July from 78° to 87°, and in Dec. from 60° to 79°.

C. is the headquarters of the governor-general of India, and the seat of the government, the supreme courts of justice, and of the court of appeal for the province of Bengal.

CALDA'NI, LEOPOLDO MARCO ANTONIO, 1725-1813; an anatomist and physician, b. at Bologna, assistant to Morgagni, the celebrated anatomist of Padua, after whose death C. was chosen his successor in the professorship. At the age of 76 he published a valuable series of anatomical plates. He had long before published *Elements of Pathology and Physiology*.

CALDAS, or CALDETAS (Lat. *calidus*, hot), the Spanish for warm springs (*aguas*, waters, being understood), which are very abundant in the Peninsula, where a great number of places have received their names from the presence of these mineral waters; such as C. de Malavella, C. de Estrac, and C. de Mombuy, in Catalonia; C. de Reyes, C. de Cuntis, and C. de Tuy, in Galicia; C. de Taipas, C. de Faveios, C. de Rainhas, and C. de Renduse, in Portugal. The name has also passed into the topography of the new world. There is a C. in Brazil, which is noted for its hot sulphur springs.

CALDER, a river in the West Riding of Yorkshire. It rises in a marsh on the borders of Lancashire, near Burnley, runs tortuously e. in the deep valley of Todmorden, past Halifax, Dewsbury, and Wakefield. It then runs n.e., and after a total course of 40 m., it joins the Aire near Pontefract, that river falling into the Ouse. The C. is important as forming a considerable portion of the canal route through Yorkshire and Lancashire, between the e. and w. coasts of England.

CALDER, Sir ROBERT, 1745-1815; a Scotch baron of an ancient family, second son of sir Thomas Calder of Muirton. He served long and honorably in the British navy, and as captain of the fleet took part in the battle off cape St. Vincent in 1797, for which he received a baronetcy and the thanks of parliament. He was rear-admiral in active-service during the expected invasion of England by Napoleon, received both praise and blame, and was tried by court-martial. He was acquitted of disaffection and cowardice, but reprimanded for not having done more to renew an indecisive engagement. Three years before he died he was restored to command.

CALDERON (DON PEDRO) DE LA BARCA HEXAO Y RIANO, was b. in Madrid, in the year 1601, and received his early education in the Jesuits' college at Madrid. Afterwards, at Salamanca, he studied chiefly history, philosophy, and law. His poetical genius was precocious. Before he was 14 years old, he had written a drama, *El Carro del Cielo* (The Celestial Chariot). In early life he gained, by his poetry, and also by his fertile invention of decorations, etc., for festive occasions, the patronage of several distinguished persons, and, on leaving Salamanca, 1619, was well received by the courtiers at Madrid. Love of military adventure induced him to enter the army, 1625; and, after serving with distinction in Milan and the Netherlands, he was recalled to the court of Philip IV., a prince fond of theatrical amusements, by whom he was employed to superintend various court amusements, and especially to invent dramas for the royal theater. In the following year C. was made knight of the order of San Jago, and took part in the campaign in Catalonia. Peace brought him back to poetry. The king gave him a pension, contrived to let him cultivate uninterruptedly his fertile dramatic genius, and spared no cost in securing for his plays a splendid initiation on the stage. In 1651, C. received from the head of the order of San Jago permission to enter the church, and, in 1653, was appointed to the chaplaincy of the archepiscopal church of Toledo; but, as this post removed him too far from the court, he was appointed chaplain in the royal chapel at Madrid, 1663, and received, with other favors, a pension charged on the revenue of Sicily. In the same year he was appointed a priest in the brotherhood of San Pedro, and shortly before his death, was elected by his brethren as their *caplan mayor*. He died May 25, 1681, leaving his considerable property to the fraternity of San Pedro, by whom a splendid monument to his memory was raised in the church of San Salvador at Madrid. Fame and pecuniary prosperity had accompanied his career. The chief cities of Spain—such as Toledo, Seville, and Granada—had paid him, from time to time, large sums of money for writing their *Autos Sacramentales*, or *Corpus Christi* pieces. In these compositions, C. excelled all his predecessors, and esteemed them more highly

than all his other works, though in many respects the latter display the author's genius quite as remarkably.

Spain numbers C. among its greatest poets, and criticism must allow that many of the defects in his works are to be ascribed to circumstances, and the times in which he lived, rather than to the native tendencies of his genius. He is characterized by brilliancy of fancy, elegance of versification, and a richness of detail, which from its very abundance often becomes tedious. His collected dramatic works—including many pieces of intrigue, heroic comedies, and historical plays, of which some deserve the title of tragedy—amount to 128. Among his romantic tragedies, the *Constant Prince* (*El Príncipe Constante*) holds the first rank. Besides these, he wrote 95 *Autos Sacramentales*; 200 *Loas* (preludes); and 100 *Saynetes* (divertissements). His last play, *Ilado y Divisa*, was written in his 80th year. His shorter poems have perished; but his dramas have held their place on the stage better than those of Lope de Vega himself. The most complete edition of his dramas appeared at Madrid (9 vols., 1683-89); another was published by Apuntes (10 vols., Madrid, 1760-63). Goethe and Schlegel have made him popular in Germany, but in Britain he is not well known, and in France not cared for.

CALDERON, DON SERAFIN ESTEBANEZ, a Spanish poet, was b. at Malaga about the commencement of the century, studied law at the university of Granada, and in 1822 became professor of poetry and rhetoric there. A volume of poems which he published shortly after procured for him some distinction. Subsequently, he became an advocate in his native city, but still continued faithful to the muses. In 1830, he went to Madrid, where he published anonymously his *Poesías del Solitario* (1833). He also wrote several articles on Andalusian manners for the *Cartas Españolas*, the only literary journal at that period in Spain. In 1836, he was appointed civil governor of Logroño, but an accident obliged him to return to Madrid, where he devoted himself to collecting MSS. of the old national literature, to be the basis of a great critical edition of the *Cancioneros* and *Romanceros*. C. wrote likewise a fine novel, *Cristianos y Moriscos*. To the literature of the Spanish Moors he paid great attention. His *Escenas Andaluces* (1847) are a series of lively sketches of Andalusian life. At his death in Feb., 1867, he left behind him a work on the *Expediciones y Aeventuras de los Españoles en Africa*. The Spanish government purchased his very valuable library.

CALDERWOOD, DAVID, an eminent Scottish divine and ecclesiastical historian, descended of a good family, was b. in 1575, and about 1604 was settled as Presbyterian minister of Crailing, Roxburghshire. Opposed to the designs of James VI. for the establishment of Episcopacy in Scotland, on that monarch's visit to his native country in 1617, he and other ministers signed a protest against a bill, then before the Scots parliament, for granting the power of framing new laws for the church to an ecclesiastical council appointed by the king, and in consequence he was summoned before the high commission of St. Andrews. Refusing to submit, he was committed to prison for contumacy, and then banished the kingdom. He retired to Holland, and in 1623 published there his celebrated controversial work, entitled *Altare Damascenum*, etc., in which he rigorously examined the origin and authority of Episcopacy. In 1622, a pretended recantation of his protest was published at London by a venal writer, Patrick Scott. While on the continent, C. was known by the quaint appellation of Edwardus Dido-clavius, being an anagram on his name Latinized. After king James's death in 1625, he returned to Scotland, and for some years was engaged collecting all the memorials relating to the ecclesiastical affairs of Scotland, from the beginning of the reformation there to the death of James VI. In 1638, he became minister of Pencailtland, near Edinburgh; and in 1643 was appointed one of the committee for drawing up the *Directory for Public Worship in Scotland*. He died at Jedburgh in 1651. From the original MS. of his *History of the Kirk of Scotland*, preserved in the British museum, an edition was printed for the Wodrow society, in 8 vols., 8vo (Edin. 1842-45), edited by the Rev. Thomas Thomson.

CALDIERO (ancient *Caldarium*), a decayed town of n. Italy, about nine m. e. of Verona. Its thermal springs were in repute as early as the 1st c. of the Christian era, and continued to enjoy popularity until the commencement of the 16th c., after which they gradually became neglected, and are now little visited. The Austrians repulsed the French here in 1796.

CALDWELL, a co. in w. Kentucky; 250 sq.m.; pop. '70, 10,828—2076 colored; generally level, and good pasture land. Iron and coal are found. Chief productions, corn, tobacco, wool, etc. The Elizabethtown and Paducah railroad is projected through this county. Co. seat, Princeton.

CALDWELL, a parish in Louisiana, on the Washita river; 528 sq.m.; pop. '70, 4820—2224 colored. Surface hilly, producing corn, cotton, etc. Chief town, Columbia.

CALDWELL, a co. in n.w. Missouri, on the Hannibal and St. Joseph railroad; 435 sq.m.; pop. '70, 11,390—284 colored; in '80, 13,645. Products, corn, wheat, oats, butter, wool, etc. Surface level, and soil rich. Co. seat, Kingston.

CALDWELL, a co. in n.w. North Carolina, on Catawba river and the Western North Carolina railroad; 450 sq.m.; pop. '70, 8476—1380 colored. Surface rough and

partly mountainous, including a portion of the Blue Ridge. Productions, corn, wheat, oats, and tobacco. Co. seat, Lenoir.

CALDWELL, a co. in s.e. Texas, e. of the San Marcos river; 535 sq.m.; pop. '70, 6572—2531 colored; in '80, 11,821. Main business agriculture and stock-raising; an undulating surface, well wooded and fertile. Co. seat Lockhart, near which are about 20 springs of some celebrity.

CALDWELL, a village and seat of justice of Warren co., N. Y., in a delightful situation at the s. end of lake George—a place much frequented by tourists. Near by are the ruins of fort St. George of the French and Indian and revolutionary wars, and on the site of fort William Henry is an immense hotel. Pop. of township, '75, 1267.

CALDWELL, CHARLES, 1772—1853; a native of N. C., celebrated as a physician, and writer on medical subjects. He published Blumenbach's *Elements of Physiology* translated from the Latin, edited the *Port Folio*, edited Cullen's *Præctice of Physic*, published the *Life and Campaigns of General Greene*; was professor of medicine in Transylvania university; made a tour in Europe; established medical institutions in Louisville; wrote *Memoirs of the Rev. Dr. Horace Holley*, and left his own memoirs ready for publication after his death.

CALDWELL, JAMES, 1734—81; a native of Va.; graduated at the college of New Jersey; became pastor of the Presbyterian church in Elizabethtown. He was a zealous patriot during the revolution, and became obnoxious to the Tories of the region, who, in 1780, burned his house and church. Soon afterwards a British force from Staten Island fell upon the village of Connecticut Farms, where C.'s wife and children were temporarily resident, and the wife was killed by a shot while praying with her children. It is of C. that the story is told of his distributing hymn books to the soldiers short of wadding, with the exhortation "Now, boys, put Watts into them." C. was shot and killed by a patriot sentinel at Elizabethtown Point during a dispute about a package that the soldier declared it his duty to examine. The soldier was tried by the civil authorities for murder, convicted, and executed. A fine monument to "The Soldier Parson" was dedicated at Elizabethtown on the 64th anniversary of his death.

CALDWELL, JOSEPH, D.D., 1773—1835; a native of N. C.; graduated at the college of New Jersey, and a tutor there from 1791—96; then chosen professor of mathematics in the North Carolina university, and in 1804 was made president and professor of moral philosophy. He wrote a *Treatise on Geometry* and letters on internal improvements.

CALEDONIA, a kind of poetical name applied to Scotland, being a resumption of that given by the Romans to the country n. of the wall of Antoninus, which ran between the firths of Forth and Clyde. Among the chief tribes of this region were the Caledonii, whence the whole country has been called Caledonia. Tacitus speaks of the Caledonians as having red hair, large limbs; being naked and barefooted; living in tents, without cities; supporting themselves by pasturing cattle, by the chase, and by certain ferries; addicted to predatory warfare; and fighting in chariots with shields, short spears, and daggers. They are supposed to have been of Gaelic or Celtic origin, and to have painted their bodies, whence the name Picti or Picts, by which, according to many writers, they were afterwards known. Agricola was the first Roman gen. to come in contact with the Caledonians. In 84 A.D. he defeated them, now united to repel a common enemy, under their chief Galgacus, at the Mons Graupius (or Graupius), the site of which has not been determined. The Romans overran the n.e. of Scotland as far as the Moray firth, and formed many encampments (of which remains still exist), but they never reduced the country to a Roman province. Roman coins and military relics have been found in connection with these camps. The name of Caledonii disappears about the beginning of the 4th c., when the inhabitants of Scotland begin to be spoken of as Scots (q. v.) and Picts (q. v.).

CALEDONIA, a co. in n.e. Vermont, on the New Hampshire border, intersected by the Connecticut and Passumpsic River railroad; 650 sq.m.; pop. '70, 22,247. It is an agricultural region, with streams that furnish abundant water-power, and has quarries of granite and limestone, and sulphur springs. Co. seat, St. Johnsbury.

CALEDONIAN CANAL, a chain of natural lakes united by artificial canals, running across the n. of Scotland in a straight line from n.e. to s.w., from the North sea to the Atlantic, through Glenmore, or the Great Glen of Albin, in Inverness-shire, and touching Argyleshire at the s. end. The sea and fresh water lochs in this line are Beauly, Ness, Oich, Lochy, Eil, and Linnhe. The canal was formed to avoid the dangerous and tedious navigation of ships, especially coasting vessels, round by the Pentland firth, cape Wrath, and the Hebrides; the distance between Kinnaird's head and the sound of Mull by this route being 500 m., but by the canal only 250, with an average saving of 9½ days for sailing vessels. The C. C. begins in the Beauly firth, near Inverness, whence a cut of 7 m. joins loch Ness, which is 24 by 1¼ mile. A cut of 6 m. joins loch Ness and loch Oich, which is 3½ by ½ mile. Another cut of 2 m. joins loch Oich and loch Lochy, which is 10 by 1 m.; and a fourth cut of 8 m. joins loch Eil at the village of Corpach, 2 m. n. of fort William. This ship communication is 60½ m. long,

37½ m. being through natural lochs or lakes, and 23 m. by artificial cuts. Each cut is 120 ft. broad at surface, and 50 at bottom, and 17 deep. The highest part is loch Oich, which is 94 ft. above the sea. There are in all 28 lochs, each 170 to 180 ft. long, and 40 wide, with a rise or lift of water of 8 feet. Eight of the lochs, called Neptune's staircase, occur in succession near the w. end of the canal. Some large mountain streams between lochs Eil and Lochy are conducted in huge culverts under the canal; and by a new cut, the Lochy water is turned into the Span. The practicability of this great work was first shown by a survey under government in 1773 by the celebrated James Watt; but it was not till 1803 that it was begun under Mr. Telford. The whole line was opened for ships in 1823. After three years of repair, it was reopened in 1847. Ships of 500 to 600 tons, fully laden, can pass through the canal. The canal and tonnage rates for sailing vessels are each a farthing per mile per ton, and a half of this for vessels under 125 tons. Steamers pay 2s. a ton. Of £1,368,203 expended on this canal, from 1803 to 1856, £1,242,387 were voted by parliament, and £90,748 were from canal dues. Heavy gales and rains in Dec., 1848, and Jan., 1849, did much damage to the canal, which was repaired by a government grant of £10,000. For the year ending April, 1876, the total income of the canal was £6741, whereas the expenditure amounted to £9307—a state of accounts by no means exceptional. There is regular steam communication by the canal between Glasgow and Inverness. The scenery is wild and romantic on both sides of the canal, and has many other objects of interest to the tourist, such as fort William, Ben Nevis, Inverlochy castle, Tor castle, the ancient seat of Cameron of Lochiel, Glen Spean, Glen Roy, with its parallel roads, fort Augustus, the fall of Foyers, and Inverness.

CALEDONIA (NEW). See **NEW CALEDONIA.**

CALEDONIA SPRINGS, in Prescott co., province of Ontario, 40 m. from Montreal. They are strongly alkaline, with additions of bromine and iodine, and are much frequented by persons afflicted with scrofulous, cutaneous, and rheumatic disease.

CALEF, ROBERT, d. April 13, 1719; a merchant of Boston, who wrote *More Wonders of the Invisible World*, in answer to Cotton Mather's book of similar title. C.'s book was so obnoxious to the witch-persecutors of the time, that it was publicly burned at Harvard, by order of Increase Mather, the president of the college, but it was of much value in ending the witchcraft delusion.

CAL'EMBOURG, or **CAL'EMBOUR**, the French name for a pun (q. v.).

CALENDAR (from *Cleands*, q. v.), the mode of adjusting the months and other divisions of the civil year to the natural or solar year. The necessity of some division and measurement of time must have been early felt. The phases or changes of the moon supplied a natural and very obvious mode of dividing and reckoning time, and hence the division into months (q. v.—see also **WEEK**) of 29 or 30 days was, perhaps, the earliest and most universal. But it would soon be observed that, for many purposes, the changes of the seasons were more serviceable as marks of division; and thus arose the division into years (q. v.), determined by the motions of the sun. It was soon, however, discovered that the year, or larger division, did not contain an exact number of the smaller divisions or months, and that an accommodation was necessary; and various not very dissimilar expedients were employed for correcting the error that arose. The ancient Egyptians had a year determined by the changes of the seasons, without reference to the changes of the moon, and containing 365 days, divided into twelve months of 30 days each, with five supplementary days at the end of the year. The Jewish year consisted, in the earliest periods, as it still does, of twelve lunar months, a thirteenth being from time to time introduced, to accommodate it to the sun and seasons; this was also the case with the ancient Syrians, Macedonians, etc. The Jewish months have alternately 29 and 30 days; and in a cycle of 19 years there are seven years having the intercalary month, some of these years having also one, and some two days more than others have, so that the length of the year varies from 353 to 385 days.—The Greeks, in the most ancient periods, reckoned according to real lunar months, twelve making a year; and about 594 B. C., Solon introduced in Athens the mode of reckoning alternately 30 and 29 days to the month, accommodating this civil year of 354 days to the solar year, by occasional introduction of an intercalary month. A change was afterwards made, by which three times in eight years a month of 30 days was intercalated, making the average length of the year 365½ days. See **METONIC CYCLE**.

The Romans are said to have had originally a year of 10 months; but in the times of their kings, they adopted a lunar year of 355 days, divided into 12 months, with an occasional intercalary month. Through the ignorance of the priests, who had the charge of this matter, the utmost confusion gradually arose, which Julius Cæsar remedied, 46 B. C., by the introduction of the **JULIAN CALENDAR**, according to which the year has ordinarily 365 days, and every fourth year is a leap-year of 366 days—the length of the year being thus assumed as 365½ days, while it is in reality 365 days, 5 hours, 48 minutes, and 50 seconds; or 11 minutes, 10 seconds less. Cæsar gave to the months the number of days which they still have.

So comparatively perfect was the Julian style of reckoning time, that it prevailed generally among Christian nations, and remained undisturbed till the renewed accumulation of the remaining error of eleven minutes or so had amounted, in 1582 years after the birth of Christ, to ten complete days; the vernal equinox falling on the 11th instead of the 21st of Mar., as it did at the time of the council of Nice, 325 years after the birth of Christ. This shifting of days had caused great disturbances, by unfixing the times of the celebration of Easter, and hence of all the other movable feasts. And accordingly, pope Gregory XIII., after deep study and calculation, ordained that ten days should be deducted from the year 1582, by calling what, according to the old calendar, would have been reckoned the 5th of Oct., the 15th of Oct., 1582; and, in order that the displacement might not recur, it was further ordained that every hundredth year (1800, 1900, 2100, etc.) should not be counted a leap-year, excepting every fourth hundredth, beginning with 2000. In this way the difference between the civil and natural year will not amount to a day in 5000 years. In Spain, Portugal, and part of Italy, the pope was exactly obeyed. In France, the change took place in the same year, by calling the 10th the 20th of Dec. In the Low Countries, the change was from the 15th Dec. to the 25th; but it was resisted by the Protestant part of the community till the year 1700. The Catholic nations, in general, adopted the *style* ordained by their sovereign pontiff; but the Protestants were then too much inflamed against Catholicism in all its relations, to receive even a purely scientific improvement from such hands. The Lutherans of Germany, Switzerland, and, as already mentioned, of the Low Countries, at length gave way in 1700, when it had become necessary to omit *eleven* instead of ten days. A bill to this effect had been brought before the parliament of England in 1585, but does not appear to have gone beyond a second reading in the house of lords. It was not till 1751, and after great inconvenience had been experienced for nearly two centuries, from the difference of the reckoning, that an act was passed (24 Geo. II., 1751) for equalizing the style in Great Britain and Ireland with that used in other countries of Europe. It was then enacted that eleven days should be omitted after the 2d of Sept., 1752, so that the ensuing day should be the 14th. A similar change was about the same time made in Sweden and Tuscany; and Russia is now the only country which adheres to the *old style*; an adherence which renders it necessary, when a letter is thence addressed to a person in another country, that the date should be given thus:—April $\frac{1}{13}$ or $\frac{June\ 27}{July\ 9}$; for it will be observed, the year 1800, not being considered by us as a leap year, has interjected another (or twelfth) day between old and new style.

The C. of the French republic remains to be noticed, which was adopted in consequence of a decree of the national convention in 1793. The midnight preceding the autumnal equinox of 1792 was fixed upon as the new epoch, from which the years were to be reckoned as the year 1, the year 2, etc. The year was divided into 12 months, each of 30 days, to which new names were given, as *Vendémiaire* (vintage month), *Brumaire* (foggy month), etc.; and instead of weeks, each month was divided into periods of 10 days, called *Primidi*, *Duodi*, *Tridi*, etc. Five *complementary* days were added at the end of each year, which were the *Fête du Génie*, *Fête du Travail*, etc. By Napoleon's command, this new system was abolished, and the use of the Gregorian C. resumed on Jan. 1, 1806.

CALENDAR, FRENCH REVOLUTIONARY. The French nation, in 1792, while reforming so many other of the world's customs, undertook the task of making a new calendar, professedly upon philosophical principles. The new era began with the republic at midnight of Sept. 21, 1792, and the months, seasons, and festivals were arranged as follows:

AUTUMN.

Vendémiaire.....	Vintage month.....	22 Sept. to 21 Oct.
Brumaire.....	Fog month.....	22 Oct. to 20 Nov.
Frimaire.....	Sleet month.....	21 Nov. to 20 Dec.

WINTER.

Nivose.....	Snow month.....	21 Dec. to 19 Jan.
Pluviose.....	Rain month.....	20 Jan. to 18 Feb.
Ventose.....	Wind month.....	19 Feb. to 20 Mar.

SPRING.

Germinal.....	Sprout month.....	21 Mar. to 19 April.
Floréal.....	Flower month.....	20 April to 16 May.
Prairial.....	Pasture month.....	20 May to 18 June.

SUMMER.

Messidor.....	Harvest month.....	19 June to 18 July.
Fervidor, or Thermidor.....	Hot month.....	19 July to 17 Aug.
Fructidor.....	Fruit month.....	18 Aug. to 16 Sept.

SANSULOTIDES, OR FEASTS DEDICATED TO.

Les Vertus.....	The Virtues.....	17 Sept.
Le Génie.....	Genius.....	18 Sept.
Le Travail.....	Labor.....	19 Sept.
L'Opinion.....	Opinion.....	20 Sept.
Les Récompenses.....	Rewards.....	21 Sept.

This calendar existed until the 10th Nivose, year of the republic XIV. (Dec. 31, 1805), when the old system was restored by Napoleon.

CALENDAR OF PRISONERS, in the practice of the criminal law in England, is the technical name given to the list of all prisoners' names in the custody of the sheriff of each county, prepared for the assizes. When the business is over, and the trials concluded, the clerk of assize makes out in writing four lists of all the prisoners, with separate columns, containing their crimes, verdicts, and sentences, leaving a blank column, in which, if the judge has reason to vary the course of the law, he writes opposite the names of the capital convicts—to be reprieved, respited, transported, etc. These four calendars, being first carefully compared together by the judge and the clerk of assize, are signed by them, and one is given to the sheriff, one to the jailer, and the judge and the clerk of assize respectively keep another. If the sheriff receives afterwards no special order from the judge, he executes the judgment of the law in the usual manner, agreeably to the directions of his calendar. In every county this important subject is settled with great deliberation by the judge and the clerk of assize, before the judge leaves the assize-town; but probably in different counties, with some slight variation, as in Lancashire, no calendar is left with the jailer, but one is sent to the home secretary.

CALENDERING is the term applied to the process of finishing by pressure the surface of linen, cotton, and other textile fabrics. It is usually done by passing the fabric between cylinders pressed together with great force; hence the origin of the term, which is a corruption of *cylindering*.

The familiar domestic processes of starching and ironing afford the simplest illustrations of the object and result of calendering. The domestic mangle effects the same object as the flat iron, and is a near approach in construction to the C. engines of the manufacturer, no traversing-box of stones being used in the new patent mangles.

The cylindrical C. machine is said to have been introduced into this country by the Huguenots, driven here by persecution. The cylinders were originally of wood, but the liability to warping is a strong objection to them.

The modern calender usually consists of 4, 5, or 6 cylinders or "bowls," set vertically in a strong iron frame, with suitable driving gear, and furnished with weights suspended over a pulley to produce the required pressure. This sometimes amounts to, or even exceeds, 20 tons, including the weight of the rollers. In a 5-roller machine, the arrangement is this: The center roller is of iron or copper, made hollow for the admission of steam or a red-hot heater, the one immediately above and that directly below it are of paper; and the remaining two, one at the top and the other at the bottom, are of cast-iron. At least one of the rollers is always of paper, as it has more elasticity than metal, and is not liable to warp, like wood. It consists of sheets of brown paper or pasteboard, densely packed and compressed on an iron axis. The edges of these form the surface of the roller, which is turned and polished, an operation of some difficulty.

Before the final rolling in the C. machine, the fabric is first lightly smoothed by passing over warm cylinders. Cotton goods are starched with a starch prepared from flour, and the starch is sometimes thickened with plaster of Paris, porcelain clay, or a mixture of these, to give a fictitious appearance of stoutness, which of course vanishes when the article is washed. For ordinary C. the fabric is then simply passed between plain cylinders, which produces the desired effect by flattening the otherwise round threads. When, by means of a hot cylinder, with a pattern raised upon it, the amount of this flattening is unequal on different parts of the cloth, the beautiful effect known as "watering" is the result. *Glazing* is produced by combined rubbing and pressure; the rollers, one of which is heated, being made to move with different velocities, so that one side of the fabric is rubbed as well as pressed by the roller whose surface moves with the greater rapidity. Before the invention of these rubbing cylinders, glazing was effected by rubbing the surface of the fabric with a polished flint. Calendering is done on a very large scale in some manufacturing towns, such as Manchester and Glasgow. In Dundee, where half a century ago it was not the custom to calender the linen at all, there are now more than 1000 hands employed in this branch of industry. Machines similar to the one above described, but with all the rollers of iron, and also called calenders, are used for rolling india-rubber into sheets for coats, shoes, etc.

CALE'NDS. The Romans made a threefold division of the month into *calends*, *nones*, and *ides*. The C. always fell upon the 1st of the month; the nones in Mar., May, July, and Oct., on the 7th; and the ides on the 15th; and in the remaining months, the nones on the 5th, and the ides on the 13th. The C. were so named because it was an old custom of the college of priests on the first of the month to *call* (or assemble) the

people together to inform them of the festivals and sacred days to be observed during the month; the nones received their name from being the *ninth* day before the ides, reckoned inclusively; and the ides from an obsolete verb, signifying to divide, because they nearly halved the month. This threefold division also determined the reckoning of the days, which were not distinguished by the ordinal numbers first, second, third, etc., but as follows: Those between the C. and the nones were termed *the days before the nones*; those between the nones and the ides, *the days before the ides*; and the remainder, *the days before the C.* of the next month. Thus, the ides of Jan. happening on the 13th of that month, the next day would not be termed by a Latin writer the 14th, but *the 19th before the C. of Feb.*, reckoning inclusively, i. e., reckoning both the 14th of Jan. and the 1st of Feb., and so on to the last, which was termed *pridie calendæ*.

Ad calendæ Græcæ, a Roman proverbial saying, practically equivalent to "never." The Roman C. were often appointed as days for payment of rent, interest, etc.; but as the Greeks had no C., a postponement of payment *ad calendæ Græcæ*, simply meant a refusal to pay altogether. It is said that the emperor Augustus frequently used the phrase, which afterwards became a proverb.

CALENTURE, a Spanish term (*calentura*) applied to a species of temporary delirium or fever occurring on board ship in hot climates, and probably due to the effect of exposure to the direct rays of the sun. The descriptions of the disease seem rather fanciful and contradictory, and the term is nearly obsolete. See *Dictionnaire des Sciences Médicales*.

CALEPTINO, AMBROGIO, 1435-1511, an Augustine monk who devoted his life to making a polyglot dictionary. The latest edition comprises 11 languages, some of them added by Passerat and others.

CALHOUN, a co. in n.e. Alabama, on Coosa river, and Selma, Rome and Dalton railroad; 1170 sq.m.; pop. '70, 13,980-3892 colored. Surface uneven and in some parts mountainous. Productions agricultural. Marble, limestone, lead, and iron abound, and some gold has been discovered. Co. seat, Jacksonville.

CALHOUN, a co. in s. Arkansas, on the Washita and Moreau rivers; 600 sq.m.; pop. '70, 3853-1100 colored. Surface rolling or level, and soil good; productions agricultural. Co. seat, Hampton.

CALHOUN, a co. in w. Florida, on the gulf of Mexico, w. of Appalachicola river; 464 sq.m.; pop. '70, 998-244 colored. Surface level and fertile, producing corn, tobacco, etc. Co. seat, Abe's Spring.

CALHOUN, a co. in s.w. Georgia; 300 sq.m.; pop '70, 5503-3477 colored. It is level, with fertile soil, but little cultivated. Co. seat, Morgan.

CALHOUN, a co. in s.w. Illinois, between the Illinois and Mississippi rivers; 260 sq.m.; pop. '70, 6562. Near the rivers the land is low and subject to inundation; in other parts marked by high bluffs and table-lands. Productions agricultural. There are coal-fields in the w. section. Co. seat, Hardin.

CALHOUN, a co. in w. Iowa, on Coon river and the Dubuque and Sioux City railroad; 600 sq.m.; pop. '70, 1602; in '80, 5591. Productions agricultural. Co. seat, Lake City.

CALHOUN, a co. in s.w. Michigan, on St. Joseph river and the Peninsular and Michigan Central railroads; 720 sq.m.; pop. '70, 36,569. Soil rich; surface generally level; productions agricultural. Co. seat, Marshall.

CALHOUN, a co. in n. Mississippi, on the Yallahusha river; 800 sq.m.; pop. '70, 10,561-2000 colored. Productions, corn, cotton, butter, etc. Co. seat, Pittsboro.

CALHOUN, a co. in s.e. Texas, on the gulf of Mexico and including Matagorda island; 684 sq.m.; pop. '70, 3443-907 colored. Surface level, and soil poor with little timber. The San Antonio and Gulf and the Indianola railroads traverse the county. Co. seat, Indianola.

CALHOUN, a co. in w. West Virginia, on the Little Kanawha river; 300 sq.m.; pop. '70, 2939; in '80, 6031. An agricultural region. Co. seat, Grantsville.

CALHOUN, JOHN CALDWELL, an eminent American statesman, descended from an Irish family who founded the Calhouns' settlement in South Carolina, was b. at Abbeville, S. C., Mar. 18, 1782. Having gained distinction at the bar, he was sent to congress in 1811, where he soon made himself the leader of the war-party against England. Author of the tariff of 1816, so favorable to his native state, he in 1817 was named minister of war by president Monroe, and reduced the confused state of affairs in his department to order, and made a great reduction in the expenditure of the army without sacrificing its efficiency.

The early part of C.'s career was marked by broad and patriotic views, to which his subsequent preference of southern interests presented an unfavorable contrast. The tariff of 1828 not being very favorable to the southern states, C. still adhered to the government, hoping that the president, Jackson, would veto the measure; but as this hope was disappointed, C. went to South Carolina, and there (1829) carried in the legislature the notorious resolution, "that any state in the union might annul an act of the Federal

government." To this decision, Virginia, Georgia, and Alabama gave in their adhesion, and threatened the dissolution of the union. President Jackson promptly used energetic measures to make this resolution of no effect. C. lost popularity, and despairing of reaching the presidency, resigned his vice-presidency; but soon afterwards was elected to the senate. In 1838, he delivered his famous speech on slavery, and continued to agitate on behalf of the slave-holding interest and for a dissolution of the union, both with voice and pen, until his death, which took place at Washington, Mar. 31, 1850. In his private character, C. was blameless; but in his career as a statesman he is understood to have implanted in the minds of his partisans those principles which culminated in the late war for the dissolution of the union. During many years, he had been employed in writing his work on *The Philosophy of Government*, in which he vindicates the doctrine of state sovereignty, and which, along with other works, was posthumously published.

CALIA'NO, a small t. of the Austrian Tyrol, situated on the left bank of the Adige, about 9 m. s. of Trent. It figures in history as the place where the Austrian archduke, Sigismund, won a signal victory over the Venetians in 1487. Being a place of considerable military importance, it was also contested in the campaigns of 1797 and 1809.

CALIBRE, or **CALIBER**, is a technical name for the diameter of the bore of a fire-arm, whether a piece of ordnance or a small-arm. The ordnance from which solid shot are projected are usually denoted by the weight of each shot, as 24-pounder, 68-pounder, etc.; but mortars, and such guns as project shell or hollow shot, are more usually denoted by the C., such as 13-inch mortar, 10-inch shell-gun, etc. The C. of the chief kinds of fire-arm will be noticed under the proper headings; but it may here be observed, generally, that the C. of English ordnance has been greatly increased within the last fifty years, partly by boring up old guns, and partly by casting new.

CALICO-PRINTING is that department of the art of dyeing which takes cognizance of the production of a colored pattern on cloth. It appears to have been first practiced at *Calicut* in India—hence the term *calico*; and the *pallampoods*, or large cotton chintz counterpanes, which have been manufactured in the East Indies for centuries, are evidence of the successful practice of the art in that country. From the East Indies, the art spread to Asia Minor and the Levant, thence to Augsburg in Bavaria; from whence, at the beginning of the 18th c., it spread to Alsace in France, to Switzerland, and ultimately to England and Scotland. The term is strictly applicable to the production of colored patterns on cotton cloth or calico; but as now employed, it includes all the processes followed in the formation of a colored pattern on cotton, linen, worsted, and silk goods, as also mixtures of two or more of these, such as the fabric called *de laine*, which is composed of cotton and worsted.

The first operation connected with the printing of cloth is the removal of the surface hairs or minute threads which communicate a fibrous down or nap to the surface of the cloth, and if allowed to remain; would interfere with the uniform application of the colors. The surface down is got rid of by the process of singeing, during which the cloth is drawn over a red-hot iron or copper bar or plate, or through a series of gas jets. The apparatus generally used for *hot-plate singeing* consists of a furnace surmounted by a metal plate, which is sometimes ridged on the surface. The cloth having previously been joined at the ends, to make a long length, and been placed on a winch-roller, is first brought in contact with roller brushes, which raise the nap on the cloth, then passes over the white-hot metal cylindrical bar, and is wound on to a second winch-roller. The process is repeated twice on the face of the cloth, being the surface to be printed on, and once on the back. *Gas-singeing* is accomplished by drawing the cloth through brushes, and then over a horizontal pipe, perforated with rows of small holes, or slit from end to end, so that the gas issuing therefrom burns as a narrow sheet of flame. The cloth is not only allowed to come in contact with the burning gas, but the flame is transmitted through the cloth, and a suction-apparatus is often placed immediately above, so as to draw the flame through more effectually. When well singed, the cloth undergoes the process of bleaching (q.v.), and is thereafter calendered. See **CALENDERING**.

There are several modes of applying the colors to cloth, and these are respectively named—1. The madder style; 2. The padding style; 3. Topical style; 4. Resist or reserve style; 5. Discharge style; and 6. China blue or pottery style. These various processes are at one in being intended to fix upon the cloth the different colors; but they differ from each other more or less in the several steps through which the cloth is passed, though occasionally there is little or no line of separation; and at times the cloth is treated by one method, and subsequently by another style.

The *madder style* is that in which a certain fixing agent or mordant is printed on the cloth, which is then introduced into the coloring matter in a dye-vat, when the mordant, having an attraction alike for the fiber of the cloth and for the coloring matter, acts the part of glue or paste, and cements the color to the cloth. Originally, madder was the only coloring substance employed in this style; but nowadays, by far the greater number of dyestuffs, vegetable and animal, including cochineal, logwood, etc., are attached to cloth in this manner. The fixing agents or mordants generally employed are different strengths of *red liquor* (acetate of alumina), *iron liquor* (acetate of iron), and mixtures of these. These are thickened with wheat-starch, potato-flour, roasted starch or dextrine,

and gum-arabic, so that the mordant may not run when it is placed on the cloth by the pattern-block or by the printing-machine. After the mordant has been imprinted on the cloth, the latter is hung in a warm airy room, where it can easily dry, but where it is at the same time surrounded by a moist atmosphere. The result is, that the mordant is decomposed, the acetic acid is evolved, and the alumina or iron is left attached to the fiber of the cloth in the state of an insoluble sub-salt, which cannot be dissolved by water. As some of the mordant is still left in its original soluble condition, it is necessary to wash the cloth free from this, else, during the dyeing operation, the soluble part of the mordant would run on to those parts of the cloth not intended to be colored, and thus produce a blotted appearance. To obviate this, the cloth, having undergone the process of *drying and aging*, is then introduced into a vat containing water, through which is diffused some cow-dung, dung substitute—a preparation of bone ash, sulphuric acid, carbonate of soda, and glue—or bran. The result of this process of *dunging* is the removal of the soluble part of the mordant, as also the starch or thickening agent, leaving the decomposed or insoluble mordant adhering to the fiber. The terms *dung-fixing*, *substitute-fixing*, and *bran-fixing*, have reference to the employment of one or other of these agents at this stage of the operation. When the cloth has been well washed from the dunging, it is introduced into the vat or dye beck containing the coloring matter. The whole is heated by steam-pipes, and the cloth being placed on a sparred reel kept in motion, is repeatedly wound out of the vat, and returned thereto. The result is, that wherever the mordant adhered to the cloth, the coloring matter is attached thereto, and little or no trace of color adheres to the unmordanted parts. The last operation is the *clearing or brightening*, during which the colored cloth is introduced into warm baths of water containing soda, soap, or, for the more delicate tints, bran, and is thereafter acted on by weak acid solutions. The object is to clear the colors, and at the same time to confer upon them the property of resisting the fading action of the air and sun for a much longer time. The different shades of color which can be obtained from the same madder beck or vat, with different mordants, are very numerous, and include reds, lilacs, purples, chocolates, and blacks. Thus, when a weak solution of red liquor (acetate of alumina) is employed as the mordant, a light red tint is procured; with a stronger aluminous mordant, a deep red is formed on the cloth; with a more or less dilute solution of iron liquor (acetate of iron), the cloth is colored lilac, violet, or purple; with a strong solution of iron liquor, black is obtained. Indeed, the same piece of cloth stamped in different places with the various strengths of aluminous and iron mordants, and mixtures of these, and immersed in the madder-bath, will be obtained dyed with all the shades mentioned; and in this manner many of the beautiful variegated colored dresses and handkerchiefs are prepared for market.

The *padding style* in calico-printing is intended mainly for the impregnation of cloth, in whole or in part, with mineral coloring substances. When the cloth is to be entirely colored, it is immersed wholly in a vat containing the mordant. When the color is to appear as a pattern on the fabric, the mordant is applied by a pattern block, or by the printing-machine. In either case, the cloth is thereafter thoroughly dried, and washed in various solutions, and then introduced into a vat containing the substance to form the color. Thus, if a piece of cloth is to be entirely impregnated with *chrome yellow*, it is first treated or *padding* in a solution of 8 parts of bichromate of potash (KO_2CrO_3) to a gallon of water, dried, and then placed in a vat containing a solution of 6 or 8 ozs. of acetate or nitrate of lead (PbO_2 , or PbONO_2) to the gallon of water. The result is that the chromate of lead (PbOCrO_3) is formed in the tissue of the cloth; and when the latter is washed and dried, the yellow color still adheres to the cloth firm and fast. To print a yellow pattern on cloth, 7 to 9 ozs. of acetate of lead, and the same quantity of nitrate of lead, are dissolved in a gallon of water, thickened with starch, and placed upon the cloth according to pattern. After drying, the cloth is first immersed in water containing a little carbonate of soda, and ultimately in a solution of bichromate of potash, when the pattern becomes fixed in bright yellow, insoluble in water. To produce *Prussian blue* on cloth, it is treated with acetate and sulphate of iron, dried, washed with warm chalk-water, and immersed in a very weak solution of yellow prussiate of potash. A pattern in Prussian blue is produced by printing a pattern in the cloth with the iron solutions thickened with gum, and thereafter proceeding as above. Chrome green is produced in a similar way, by using sulphate and acetate of copper, thickened with glue, and thereafter arsenious acid with potash; and so also other colors, such as iron buff or chamois, manganese bronze, etc.

The *topical style* in calico-printing is the process whereby certain coloring matters which are insoluble in water, and cannot therefore be applied to cloth by the modes suggested under the madder and padding styles, are treated at once with the mordant, and the mixture by one operation transferred by block, or otherwise, directly on the surface or *top* of the cloth, and hence the term *topical*. Indigo, safflower, and arnotto are instances of such insoluble coloring substances; and when these and other dye-stuffs, such as log-wood and Brazil wood, are treated with water, thickened with starch and nitro-muriate of tin (known as *spirits*) added, with occasionally a little of other salts, such as nitrate of copper, the result is the formation of *spirit-colors*, which can be printed on the surface of cloth, and possess a certain degree of fixity. The permanency of these *spirit-colors*, however, is very much increased, and the general appearance improved, by after-

wards subjecting the goods to the action of steam in a wooden chest or box, when the term *steam-colors* is applied.

The *resist style* in calico-printing is that in which certain materials are placed on the surface of cloth, to protect it from the adherence of the mordants, and, consequently, to keep that part of the cloth from being attacked by the coloring matter. These materials are termed resists, reserves, or resist-pasters, and they are divisible into mechanical and chemical. The *mechanical resists* are such substances as fats, resins, oils, wax, and pipe-clay. A common resist for silk and woolen goods is a mixture of $2\frac{1}{2}$ of resin and 1 of suet; and it is principally in the color-printing of silk and woolen dresses and handkerchiefs that mechanical resists are employed, though they are occasionally used for the printing of cottons. The chemical resists may act on the mordant or on the color. Thus, if it be desirable to remove the mordant, and thus leave certain parts of the cloth unable to attach color, the printing of a pattern with some acid substance on the cloth will form with the mordant a soluble salt, which can be readily removed by washing, whilst the parts which have not been so acted on by acid are not dissolved away by the washing, and still retain the full power in the color-vats to cause the adhesion of the color. For this purpose, where an iron or aluminous mordant has been employed, it is customary to print thereon in the requisite pattern, lemon-juice or lime-juice (containing citric acid), tartaric or oxalic acid, and bisulphate of potassa, or a mixture of two or more of these, thickened with pipe-clay, China-clay, gum-arabic, dextrine (British gum), gum-senegal, or a mixture of these; occasionally, chloride of tin is employed. Sulphate of zinc, sulphate and acetate of copper, and the chloride of mercury, are used to resist the adherence of indigo blue.

The *discharge style* in calico-printing comprehends the employment of similar materials to those used in the resist style, but *after* the cloth has been colored or dyed, and for the purpose of discharging the color, or bleaching the cloth at certain parts, according to pattern. The dischargers for organic coloring matters are chlorine and chromic acid. The chlorine is employed in the form of bleaching-powder (q. v.), and the cloth already dyed is printed with a solution of tartaric acid (or other acid), thickened with pipe-clay and gum, then dried, and passed through a solution of bleaching-powder, when the decoloration occurs, as already explained under BLEACHING. The chlorine is also applied by placing a number of folds of colored cloth between perforated pattern-plates, and subjecting the whole to great pressure; a solution of chlorine (obtained by adding an acid to a weak solution of bleaching-powder) is allowed to percolate down through the perforations of the plates, and the cloth immediately underneath, so that only those spots are bleached, while the rest of the cloth is so highly compressed as to keep the liquid from coming in contact therewith. The well-known Turkey-red handkerchiefs are *patterned* in this way. The chromic acid is generally employed in discharging indigo color. The cloth, already entirely blue, is soaked or padded in bichromate of potash, and then an acid discharger printed thereon; and wherever the acid discharger (tartaric, oxalic, citric, or hydrochloric acid) comes in contact with the blue cloth containing the bichromate of potash, chromic acid is liberated, and destroys the color. Instead of acting upon the colored cloth, the discharger may be employed to carry off the mordant. Thus, cloth treated wholly with a mordant, and thereafter printed with a pattern in acid, has the mordant removed at those parts where the pattern block has placed the acid. Mineral colors can also be discharged in a similar way.

The *China blue* or *pottery style* in calico-printing is a modification of the topical style, where indigo is deposited on cloth in the insoluble state, and is thereafter manipulated with, so as to impregnate the cloth with the indigo more or less strongly, and thus produce different shades of blue.

The above descriptions of the various operations in calico-printing have special reference to cotton cloth; and though many steps of the manipulative processes apply equally well to linen, silk, worsted, and de laines (worsted and cotton), yet considerable modifications in mode of treatment and material employed are required in the successful color-printing of all texture containing animal fiber, such as silk and wool. Where the printing of such fabrics differs essentially from the processes already indicated, special reference will be made under SILK and WOOL. The different coloring matters employed in calico-printing being identical with those used in dyeing, will be considered under the general popular title DYE-STUFFS; and the mode of compounding these into the various colors and shades, will be more appropriately introduced under DYEING.

CALICUT, a seaport of the district of Malabar, which, though on the w. side of the peninsula of Hindustan, yet forms part of the presidency of Madras. In lat. $11^{\circ} 15' N.$, and long. $75^{\circ} 50' E.$, it is distant from Goa and Bombay respectively 300 and 566 miles. It was the first spot in India visited by Vasco da Gama, being then the chief emporium on the coast, with stately dwellings and magnificent pagodas. So populous and powerful was it, that it twice repulsed the Portuguese, slaying their commander in 1509, and expelling Albuquerque himself, after a momentary success on his part, in 1510. It stands near the mouth of a small river of the same name, appearing to have possessed at one time a tolerably good haven. Gradually, however, this harbor has been filled up with sand; and now its anchorage is merely an open roadstead, at a distance, at least

for large vessels, of 2 or 3 m. from land. Independently of this physical disadvantage, the ravages of war and the competition of superior localities contributed to the decay of Calicut. Accordingly, in 1792, when it fell into the hands of the English, the city was little better than a ruin. Since then, it has made considerable progress, and in 1871 was found to have 47,962 inhabitants. From *C. calico* is understood to have derived its name, just as *cambric* from Cambrai, in the n.e. of France.

CALIFORNIA. This name was at first applied to a peninsula on the w. side of Mexico, but was gradually extended to an indefinite portion of the adjoining continent, as far n. as the parallel of 42°. The original C., however, and its augmentation were distinguished from each other as old and new, lower and upper. In 1848, partly by conquest and partly by purchase, continental C., down to the parallel of 32° 28', was ceded to the United States. After existing as a *territory* for two years, it was, in 1850, constituted one of the United States; bounded n. by Oregon, e. by Nevada and Arizona, s. by Lower C., and w. by the Pacific. Between the two Californias of the present day, the American one and the Mexican one, there is nothing in common but the name.—1. *Mexican C.* is the peninsula above mentioned, which, though considerably longer than Great Britain, is yet so narrow as to be very little larger than Scotland. From end to end, it is one ridge of mountains, which here and there rise to about 5000 ft. above the sea. A few favored spots yield fruits and grains in abundance; but, generally speaking, the productions are unimportant, for even trees, and those of no great size, are found only towards the southern extremity of the country. The population does not exceed 25,000—the oldest and most considerable town, Loretto, on the e. side, containing barely 1000 inhabitants. On the w. side is the magnificent harbor, peculiarly valuable on a coast so destitute of shelter, formed by the bay of Magdalena and the island of Santa Margarita.—2. *American C.*, vaguely claimed, under the name of New Albion, by Drake for England in 1579, lay unoccupied till 1767, when it was invaded by Franciscan friars, the successors in Mexico of the newly expelled Jesuits. These zealous apostles, backed, when necessary, by armed coadjutors, planted various missions, bringing under their influence, such as it was, the great mass of the aborigines. Under such circumstances, the new province became pre-eminent, even in Spanish America, for everything that could paralyze the progress of a community. Anglo-Saxon speculators engrossed most of the trade; American trappers walked through the land as if it had been their own; the Muscovites established, in the n., a town under the ominous title of *Ross* or *Russia*; and a Swiss adventurer of the name of Sutter, who had carved out for himself a *Nova Helvetia*, virtually set the government at defiance. But the discovery of gold in Sutter's mill-race during 1847, and the political transfer of 1848, taken together, changed, as if by a miracle, the aspect of affairs. The matchless harbor of San Francisco became the grand mart on the Pacific, presenting a center of attraction to the restless and energetic of every race and every clime. Between 1850 and 1855, the population increased from 92,597 to 327,000; in 1870, it was 560,247; and in 1875, it was above 800,000, of whom 75,000 were Chinese. The total yield of gold in this state up to 1875 was about \$1,000,000,000. In 1874, the value of the gold and silver produced was \$20,300,531, and in 1875, \$17,753,151. C. possesses the richest quicksilver mine in the world—that of New Almaden—which at one time produced from 2,500,000 lbs. to 3,500,000 lbs. per annum. It now yields about 1,000,000 lbs. In 1864, 15,000 tons of copper were exported, to be smelted at Swansea and Boston, but not nearly so much is now produced. Platinum has been found in many of the placers. There is coal in nearly all the coast counties; and asphaltum is produced by many springs along the southern coast. Other mineral products are iron, tin, and borax. The yield of wheat in 1870 was 16,676,702 bushels; of barley, 8,783,490. In the year 1875, 8,000,000 gallons of wine were made, the product of 30,000,000 vines. Silk culture is making rapid progress; and the woolen factories of C. consume nearly 6,000,000 lbs. of wool annually, while about 30,000,000 lbs. are exported. Manufacturing industry has lately greatly increased, the chief manufactures being woolen goods, flour, iron, glass, wine, sugar, and silk. The amount of taxable property, real and personal, as assessed in 1878, was \$584,583,651. The state debt amounted in the same year to \$3,403,000.

The country is mountainous, and is cut into coast and interior by a subordinate range from Oregon. The interior is subdivided into the valleys of the Sacramento and the San Joaquin—two rivers from the n.e. and the s.e., which enter the noble haven of San Francisco. The former is the chief seat of the "diggings." Since the completion of the Pacific railway, terminating in San Francisco, C. has been visited by many pleasure-seekers, attracted by its magnificent scenery. The most celebrated district is the Yosemite valley (q.v.). C., with a lovely and salubrious climate, produces fruits and grains freely, under advantageous circumstances of soil and situation. In the growth of timber, however, it appears to be almost unrivaled. Fremont measured one tree that was 21 ft. in diameter, or 66 in circumference; and another has been seen, which, with a length of 150 yards, is nearly 120 ft. in girth. A *sequoia gigantea* in Mariposa county is 274 ft. in height. Besides San Francisco, the state contains the cities of Sacramento (the capital), Oakland, Stockton, San José, Los Angeles, Marysville, and San Diego, with the second best port in the state. There are several Protestant and Catholic colleges in C., and education is progressing.

CALIFORNIA (*ante*). This name, originally given to a portion of western North America, was apparently taken from a Spanish romance published in 1510, in which the author speaks of "the great island of C., where a great abundance of gold and precious stones is found." The coast of the present C. was explored by Cabrillo, in 1542, as far up as cape Mendocino, in 42° north. In 1578, sir Francis Drake, who was plundering Spanish commerce, coasted along as far as 48° n., and landed to refit his ships either in sir Francis Drake's bay or the bay of San Francisco—probably in the former. In 1602, the bays of San Diego and Monterey were discovered by Viscaino, and then came an interval of a century and a half before settlements began to be made. The Jesuits, who had missions in lower C., made some settlements in the present C. about 1760; but in 1767 they were expelled from the country by the order of the king of Spain, and their property was turned over to the Franciscans, who established a number of missions, and prospered well until Mexico became independent (1822); thenceforward they rapidly declined, and in 1840 were broken up altogether. The treatment of the natives by these missions was such as to promote their worldly welfare, but was not especially notable for intellectual improvement; indeed, it is charged that the Indians were little better than slaves under this rule. There were in all 21 missions, the first founded in 1769, the last in 1820. They were all on or near the coast or bay of San Francisco, and the priests displayed excellent judgment in selecting for their settlements the best garden spots in the country. The Indian population was large until about the time of the cession to the United States. In 1734, the Indians drove out the Jesuit missionaries, but they returned very soon and succeeded in collecting and to some extent civilizing many of the natives, so that 40 years ago the "mission" Indians numbered about 30,000. The aborigines in northern C. were much superior to those in the south. Under Mexican rule the Indians were recognized as owners of their lands, but the United States never acknowledged the right, and now the aborigines are homeless. In 1870, there were 29,000 Indians in all the states. The principal tribes were the Klamaths, the Hoopas, the Ukies, the Redwoods, the Tulés, the Tejons, the Siahs, the Wylackies, the Concows, the Wichmunies, the Coweas, and the Yokas.

California was very little known on this side of the continent until within the past 35 years. Half a century ago, about all the trade with C. was from Boston, whose merchants sent out groceries and cotton goods in exchange for furs, the voyage around cape Horn lasting two years or more. Now and then a wandering American or Englishman would settle in C., and a few daring adventurers found their way across the continent, so that by 1830 it was thought there were as many as 500 foreigners w. of the Sierra Nevada.

The territory was once seized by the United States, but was relinquished the next day. This was in 1842, when commodore Jones of the American navy captured the fort at Monterey, and hoisted the stars and stripes; but the next morning he hauled down his flag, and apologized for the mistake. It was about this time that three nations, the United States, France, and England, were looking with peculiar interest at the Californias, upper as well as lower. Both the European powers were suspected of coveting possession, a thing the United States could not tolerate. The result was that about the time war was declared against Mexico, col. Fremont, who was conducting a scientific expedition on the Pacific coast, received—in May, 1846—certain instructions by an officer who had landed from a national ship at Vera Cruz, and crossed the land to Mazatlan; whereupon Fremont abandoned his investigations and made his way to Sonoma, where he organized a battalion of mounted riflemen, and on the 5th of July recommended a declaration of independence. On the 2d of that month commodore Sloat in a United States frigate put in at Monterey, and on the 7th hoisted the stars and stripes with no intention of imitating his predecessor's example by pulling them down. He issued a proclamation declaring C. to be from that time forward a part of the United States. Some little fighting was had with the Californians, and there arose a bitter discussion among army and navy officers concerning their part in the conquest of the country. Fremont brought trouble on himself by obeying the orders of commodore Stockton (who had superseded Sloat) instead of those of gen. Kearney, who ranked him and assumed command. Kearney preferred charges, and Fremont was tried by court-martial, which found him guilty of "mutiny and disobedience of the lawful command of a superior officer." The president rejected the finding as to the mutiny, and remitted the penalty on the other count, but Fremont refused the clemency and resigned. He afterwards conducted several famous overland expeditions, which met great sufferings, and was so much connected with Californian affairs that the people almost everywhere considered him the real conqueror of the territory.

At the end of the war the annexation of C. to the United States came with the treaty of peace, ratified May 19, 1848, and then the question became pressing whether it should be a free or a slave state—a question hotly discussed long before. Up to the adjournment of congress, on the 4th of Mar., 1849, nothing had been done towards organizing either state or territorial government except making San Francisco a port of entry, and extending the customs and revenue laws over the country. The people of C. then took affairs into their own hands, and in Sept. of that year held a convention, which framed a state constitution in which slavery was expressly forbidden. On the 7th of Sept., 1850, a bill was passed by congress admitting C. as a state without slavery, but

leaving New Mexico and Utah (organized into territories on the same day) open to its introduction. This legislation was the "omnibus bill" and a part of the famous compromise measures through which it was hoped that the question of slavery would be permanently settled, or at least removed from discussion in congress.

The discovery of gold at capt. Sutter's mill, in Feb., 1848, attracted towards C. a tide of emigration unparalleled in modern times. From 40,000 a year or two before the war, the white population rose to 323,000 in 1860, and 500,000 in 1870. The gold fever was the phenomenon of the age. The emigrants were nearly all young or middle-aged men, scarcely a hundred women going out for the first year or two. Nine tenths of the adventurers rushed at once to the mines, or prospected for new ones. The organization of society was neglected, and in many places the only law was the momentary decision of the people themselves. Fortunes were made in a day, and the golden stream flowed eastward with steady and rapid increase, so that the gold production of the United States for the 17 years from 1849 to 1875 averaged \$15,600,000 per year. In 1853, the product of the C. mines was \$65,000,000. All property was affected by the fever; lots in San Francisco were worth gold coin enough to carpet them; speculation ran wild; all forms of gambling were recognized as legitimate business; adventurers and criminals flocked in, and society became chaotic. Self-preservation soon demanded order, and the celebrated vigilance committee enforced it. The latest of those committees assumed the proportions of a regular government, and resisted the efforts of the state power to disband it; but formally resigned near the close of 1856, after hanging four culprits, and driving hundreds of the worst from the state.

C., popularly called the "golden state," is bounded on the n. by Oregon, the line running e. on the 42d degree to the 120th parallel, thence s. to the 39th degree, thence s.e. to the intersection of the 35th degree on the Colorado river, thence along that river to the Mexican or lower California boundary about 33° n., and thence direct nearly w. to the Pacific. The extreme length from s.e. to n.w. is about 750 m., and the breadth an average of about 240 m. The area given in the census of 1870 is 188,981 sq. m., but that amount is probably too large by 25,000 sq. m. Near the coast below 34° are the islands of San Miguel, Santa Rosa, Santa Cruz, Santa Barbara, Santa Catalina, San Nicolas, and San Clementes, but none of them are important, and but one or two are under cultivation.

The principal harbors on the Pacific are San Francisco, San Diego, Humboldt, Santa Barbara, Monterey, Bodega, San Luis Obispo, and Tomales. The bay of San Francisco is the finest harbor on the Pacific coast. Entering by the "Golden Gate," a strait only a m. wide and 5 m. long, vessels are in a land-locked bay about 9 m. wide by 50 in length, sheltered from the ocean by land from 6 to 15 m. wide. The bay of San Pablo is a portion of that of San Francisco. San Diego, in the s., is also an important harbor. The surface of C. is generally rough. There are two mountain chains running through; the Coast range, and the Sierra Nevada, or snowy mountains, the latter forming in some parts the eastern boundary of the state. Both ranges are united at the n. and s. end. The Coast mountains are comparatively low, seldom showing peaks as high as 5000 feet. The range is near the ocean, and there are but few available harbors along the 700 m. of coast. The bay of San Francisco pierces this range, which is further divided by valleys such as the Napa, Sonoma, Los Angeles, and Salinas. In breadth the Coast range is from 20 to 40 miles. The plains and valleys are fertile, and generally have a delightful climate. A lesser chain, the Mount Diablo range, is about 150 m. in length by about 25 wide. One of the prominent natural features near San Francisco is the Contra Costa range of hills, running from Carquines bay about 50 m. in a s.e. direction. Some of the higher of the Coast mountains are: Mts. Diablo, 3881 ft.; Ripley, 7500 ft.; Downie, 5675 ft.; and San Carlos, 4977 ft. All these mountains are heavily clothed in verdure, and nearly all contain minerals of value. In the n. part of the state numerous branches of the Coast range and the Sierras intermingle, rendering that portion extremely rugged. The Sierra Nevada range, starting from Mt. San Bernardino, about 34° n., runs n.w. and n., and reaches the Coast range again at 41° 15' by a western spur. The summits of the Sierra mountains are in many instances above the snow line, and there are but few available passes. The range is about 450 m. long, and from 50 to 80 m. wide. The mountains are thickly wooded as far as trees will grow, and above the green pines shoot up bare and snow-covered granite peaks. Some of the altitudes are: Shasta, 14,442 ft.; Tyndall, 14,386 ft.; Brewer, 13,886 ft.; Dana, 13,277 ft.; Castle, 13,000 ft.; Lassen, 10,577 ft. The Johnson "pass" over this range is 6752 ft., and that of the Central Pacific is 7042 ft. above tide. Mt. Diablo, about 28 m. n.e. from San Francisco, is a lone and very conspicuous peak, affording from its summit a comprehensive and picturesque view; and the same is true of Mt. Helena, at the head of Napa valley, 60 m. n. from San Francisco.

The region between these great mountain ranges seems to have been once the bottom of a lake. It is now called the Sacramento and the San Joaquin valleys, and includes about 25,000 sq. m., reaching 400 m. n. and s., and having a width of more than 50 miles. The Sacramento and San Joaquin rivers drain this valley—the former the northern and the latter the southern portion. Near the central part of the region these rivers unite, and find an outlet through the coast mountains to the ocean. In the extreme s. small lakes and marshes cover a considerable extent. The land in this vast central basin is

remarkably fertile, and level near the large streams, but rolling and hilly towards the mountains. There is a plateau or table-land in the n. at about 41°, which is more than 100 m. long and about 5000 ft. above tide. This high plain forms a basin by itself, having no outlet for water. In the s. part of C. is another basin known as the Colorado desert. It is about 150 by 70 m., and is mostly a barren waste of sand.

The largest river is the Colorado, which forms the boundary along Arizona, and is navigable beyond the C. line. The Sacramento is navigable as far as the city of Sacramento, and the San Joaquin is available for light-draft boats nearly to the sierras. Mountain lakes are a feature of California. Lake Tahoe, on the summit of the sierras, 6200 ft. above tide, is about 20 m. long and 1500 ft. deep, and its water is exceedingly pure. The overflow passes into Truckee river, and disappears by evaporation. Other lakes are Clear, Owen's, and Mono, the latter 14 by 9 m., and 7000 ft. above the sea. In Lassen and Modoc cos. are several large alkaline lakes.

The wonderful scenery of the Yosemite valley is known the world over. This valley is in the sierras, about 150 m. a little e. of s. from San Francisco. The valley is nearly 4000 ft. above tide, and is hemmed in by almost perpendicular cliffs from 2000 to more than 3000 ft. high. The cascades in and around the valley are of great beauty and variety. Yosemite creek falls 2600 ft. in three leaps, the highest being 1500 feet. The Merced and Nevada falls combine nearly as great heights with larger bodies of water, and are surprisingly grand. A commanding object in the valley is the Half Dome, a rocky mass rising about 4750 ft. above the level, and presenting a vertical face of 1500 feet. Parallel with the Merced river, which flows directly through the valley, and a little farther n., is the Tuolumne, noted for the number and beauty of its cascades, and the picturesque scenery along its course. This river falls 4650 ft. in the course of 22 miles. Mt. Dana, over 13,000 ft. high, dominates the region above the Yosemite, and from its easily accessible summit opens a magnificent panorama of the Sierra Nevada. Mono lake is 7000 ft. below; beyond are the lofty and in some instances snow-clad peaks of the great basin, while volcanic cones are visible to the s. of the lake.

"The big trees" are another peculiar and remarkable feature of California. There are several groups or patches of these forest giants, the most important being about 30 m. n.e. of Visalia. They are called *sequoia gigantea*, or giant red-wood, and vary from the height of a large pine to nearly 400 ft., with circumferences at a man's height from the ground varying from 25 to more than 100 feet. One is still standing that is reported to be 376 ft. high and 104 ft. around; and remains of fallen trees show that there have been specimens considerably larger. One was cut down which was more than 24 ft. in diameter without, and about 27 ft. with, the bark, or a circumference of nearly 85 ft.; its age was nearly 1300 years. Other C. timbers are pines in large variety, black oak, ash, hickory, elm, beech, white cedar, spruce, fir, laurel, tamarack, cypress, yew, juniper, chestnut, acacia, poplar, cottonwood, walnut, maple, buckeye, etc. Of shrubs the more remarkable are the thorny manzanita and the chamiso, which form the impenetrable undergrowth known as "chaparral."

The fauna of C. is varied and extensive, and may be headed by the grizzly bear (now almost extinct). There are black, brown, and cinnamon bears; sea-lions, whose noises and gambols around Seal Rock in San Francisco bay attract thousands of sight-seers; beaver (rapidly disappearing); ground squirrels (great plagues to farmers for their burrows in the soil); gophers (a similar nuisance); mountain squirrels; elk (once abundant but nearly extinct); deer; antelope (rapidly thinning out); mountain sheep (also nearly gone); raccoons, skunks, badgers, martens, minks, weasels, wolves, muskrats, porcupines, otters, wild cats, coyotes, foxes, rabbits, etc. Birds are abundant; those peculiar to the region are the road-runner, nearly allied to the cuckoo, but like a pheasant in habit of running and inaptitude to fly; the C. woodpecker, which bores holes in the bark of trees and fills the cavities with acorns, the object apparently being to collect food in which grubs will fatten and in due time gratify the palate of the bird. The C. culture is the largest flying bird in North America; the sage hen is a valuable bird, and plentiful; there are two species of quail, besides eagles, hawks, owls, buzzards, crows, magpies, ravens, jays, swallows, humming-birds, robins, larks, orioles, pigeons, doves, cranes, bitterns, herons, coots, snipe, rails, sandpipers, curlews, ducks, teal, geese, the pelican, albatross, cormorant, loon, gull, petrel, etc. The rattlesnake is the only dangerous reptile, but there are many other serpents, with tortoises, frogs, toads, lizards, and salamanders. Fish are abundant, and include salmon, eels, mackerel, blackfish, perch, redfish, flounders, herring, shad, sturgeon, sharks, and sunfish. Oysters, clams, scallops, etc., with lobsters, crabs, and shrimps, are abundant.

Nearly all the gold mines are on the western slope of the Sierra Nevada, in a belt of country about 220 by 40 m., or nearly 9000 sq.m., extending n. to Oregon. The richest section is in the middle of this auriferous belt. The gold is in a metallic condition, and mixed with silver and other metals. In the stream and alluvial deposits the metal is in fine scales, with occasional lumps; in rock it is in veins or quartz lodes. The gold in the soil is gotten out by washing, and the process is called "placer mining," from "placer," i.e., "place of deposit." Rock mining is more expensive, and requires heavy and costly machinery for crushing or grinding the quartz, from which the metal is extracted by amalgamation with quicksilver. From a single quartz mill in 1851, the number rose to 421 in 1870. Mercury is found in C. in the form of sulphuret, or cinnabar,

which is plentiful in the coast range in the s. part of the state, particularly at New Almaden. In separating gold by amalgamation, the crushed ore is put with the mercury into a revolving drum, and whirled around for a time. When the drum is opened there is found a fluid mass, which is the mercury, appearing half congealed, and containing all the gold. The mixture is poured into a retort and heat is applied, when the mercury distills over, leaving the gold in the retort. The mercury is then ready for future use. Silver has been found in many places in C., but not much attention has been given to it. There are silver and copper ores in combination in the s.e. part of the state, and very superior magnetic iron ores in the coast range and other parts. Copper and manganese have also been found, and the valuable platinum is plentiful in the valley of the Klamath. Tin, lead, zinc, plumbago, and antimony are found, and there are asphaltum and petroleum in some places. There are hot springs impregnated with alum; and buhrstone, alabaster, granite, and marble, some of the latter finely variegated. Gypsum, bismuth, brick and porcelain clay, and hydraulic limestone are found. There is bituminous coal in Mt. Diablo and the neighboring hills, and salt in several places. Very rich deposits of sulphur have been worked in one locality. One of C.'s mineral novelties is biborate of soda, or borax, found in Clear lake, the water of which is impregnated with the mineral, the borax being crystallized in the mud that forms the bottom of the lake; and near another borax lake there are a number of boiling springs, the water of which is impregnated with soda, chlorine, and boracic acid.

The state possesses some valuable advantages of climate, the leading feature being the remarkable uniformity of temperature. Comparing San Francisco with Washington, we find the mean of the year to be about the same; but the summer mean is 60° in San Francisco and 76.3° in Washington, while the winter mean is 51° in San Francisco and 36.05° in Washington. On the Pacific coast the isothermal lines run much farther n. than on the Atlantic. The line that passes through New York touches the Pacific near Vancouver island; that of Halifax, N. S., reaches n. of Sitka, in Alaska; and if we go s. down the sea-coast we find San Diego 6 or 7 degrees cooler than Charleston and Vicksburg, which are in nearly the same latitude. There are but two seasons in C., the dry, and the rainy; the winds are remarkably uniform, and in the hot months there is invariably a strong cool breeze from the ocean. Some of the valleys shut from the wind endure very high temperature, often as much as 120° in the shade; but even there at night the radiation is so intense that bed-blankets are needed. In the s.e., C. is intolerably hot; at fort Yuma the range is often above 90° day and night for weeks together; but this is an exceptional place.

The volcanic character of C. is manifested by the mountain formations, and, as in all such regions, there are occasional earthquakes. There was one in Mar., 1872, of great violence, giving one tremendous and many lesser shocks, upheaving and cracking the ground, and causing the destruction of 30 lives and a vast amount of property. In 1861, there were heavy floods in the same parts of the state, whereby property to the value of millions of dollars was destroyed. To these calamities fire added enormously, especially in San Francisco.

Agriculture in C. is dependent upon the amount of rain. If there is plenty, excellent crops are the result; if rain fails, the crops are inferior or worthless. Only a small portion of C.'s 120,000,000 acres are available for farming, and the census of 1870 returned only 6,200,000 so used. Sowing is done in Nov., and June and July are harvest months. Machinery is largely employed in agriculture. Fruits are important and abundant. Grapes and wines from C. are always in the eastern markets. As early as 1861, a million gallons of wine were made in C. (see AMERICAN WINES). Apples, pears, plums, apricots, oranges, lemons, figs, pomegranates, olives, and almonds are raised. Cotton and the sugar-beet grow well. Wool-growing is a large industry, the hilly parts of the state being well adapted to the raising of sheep, which need neither fodder nor shelter, even in winter.

C. is not remarkable for manufacturing industries, though they are increasing. Flour and grist mills and lumber-mills are in great number. Boots and shoes, cigars, wagons, woolen goods, gunpowder, tanneries, chemicals, and iron may be mentioned. The branch mint in San Francisco turns out a large coinage.

The heterogeneity of the population of C. is noticeable. The gold excitement brought people from the ends of the earth, and every slumbering clime awoke and sent onward her legions. Of 560,247 inhabitants in 1870, 209,848 were born in the following countries: Africa, 48; Asia (not including China and Japan), 56; Atlantic islands, 943; Australia, 1593; Austria, 1078; Belgium, 291; Bohemia, 90; British America, 10,670; Central America, 126; China, 48,826; Cuba, 45; Denmark, 1837; France, 8068; Germany, 29,701; England, 17,699; Ireland, 54,421; Scotland, 4949; Wales, 1517 (total of British subjects, 90,926); Greece, 97; Greenland, 1; Holland, 472; Italy, 4660; Japan, 33; Luxembourg, 11; Mexico (the native Californians were naturalized by the treaty), 9339; Norway, 1000; Pacific islands, 93; Poland, 804; Portugal, 2508; Russia, 540; Sandwich islands, 278; South America, 1956; Spain, 405; Sweden, 1944; Switzerland, 2927; Turkey, 17; West Indies (except Cuba), 350; at sea, 142. Every one of the United States and territories was represented. The largest numbers were from New York, 33,766; Illinois, 10,695; Maine, 11,261; Massachusetts, 15,334; Missouri, 16,050; Pennsylvania, 11,201; others ranging from 10,000 down to 7 for Dakota, while 23 came

from Alaska. The natives of C. were 163,653, not quite 30 per cent of all natives. Of the entire population only 26,909 were natives of the United States born of native parents, or less than 5 per cent. Males largely exceeded females, being 349,479 to 210,768. The Chinese are the cause of much annoyance to many of the people, who urge against them that they unduly cheapen labor, and that they bring demoralization; and strong efforts have been made, both by legislation and by popular violence or threat, to keep them out, but hitherto without effect. The problem is complex and difficult; and its solution cannot be said to have been yet reached. In 1870, there were 11,703 Chinese in San Francisco, about 8 per cent of the total population.

The chief cities and towns in the order of population, in 1870, are San Francisco. Sacramento (the state capital), Oakland (across the bay from San Francisco), Stockton, San Jose, Los Angeles, Maryville, Santa Cruz, San Diego.

C. is well supplied with serial literature. At the beginning of 1879 there were 41 daily newspapers, 1 tri-weekly, 9 semi-weekly, 209 weekly, 1 semi-monthly, 19 monthly, 1 bi-monthly, and 2 quarterly publications. The state has made ample provision for education. School age is from 5 to 21; persons within the age, 205,475; enrolled, 154,079; average attendance, 94,696; school-days in the year, 144; teachers of common schools, 3293; school fund, \$2,011,800; income, \$3,820,661; expenses, \$3,155,815; value of school property, \$6,343,369. There is a state normal school at San Jose, having, at last report, 90 students. In 1879, there were 13 colleges, viz.: Sacred Heart, St. Ignatius, and St. Mary's, all in San Francisco, and Our Lady of Guadalupe, at Santa Inez (all Roman Catholic); C. college, at Vacaville (Baptist); Hesperian, at Woodlawn, and Pierce Christian, at College City (both "Christian"); Pacific Methodist, at Santa Rosa (Methodist Episcopal, South); university of the Pacific, at Santa Clara (Methodist); St. Augustine, at Benicia (Protestant Episcopal); the university of C., at Berkeley, and the university, at Washington (both non-sectarian). The Pacific theological seminary (Congregational) and the San Francisco theological seminary (Presbyterian) are at Oakland. Medical education is provided for by the C. college of pharmacy, a medical department of the university of C., and the medical college of the Pacific, all in San Francisco. The university has also a law department. In the 13 colleges there were 199 instructors and 3187 students; in the theological seminaries, 7 instructors and 15 students of collegiate grade; in medicine, 26 instructors and 90 students; and in law, 3 instructors and 103 students. A special course of three years is provided for young women by the Pacific (Methodist) college, and women are admitted to all, except the Roman Catholic colleges.

The railroads in California at the beginning of 1879, and the number of miles within the state, were: Southern Pacific, from San Francisco to Colorado river (to unite with the projected Texas Pacific from the Mississippi river), 712 m.; Central Pacific, from San Francisco to Ogden, Utah, 615 m.; Northern, from Oakland to Suisun, 113½ m.; California Pacific, from San Vallejo to Sacramento, 113 m.; San Francisco and N. Pacific, from San Rafael to Cloverdale, 94 m.; N. Pacific Coast, from Sancelito to Moscow mills, 79½ m.; Sacramento and Placerville, from Sacramento to Shingle springs, 49½ m.; San Pablo and Tulare, from Tracy to Martinez, 47 m.; Stockton and Copperopolis, from Stockton to Oakdale, 44½ m.; Vaca Valley and Clear Lake, from Elmira to Madison, 30 m.; S. Pacific Coast, from Dumbarton to Los Galos, 29½ m.; Los Angeles and San Diego, from Florence to San Diego, 27 m.; Amador Branch, from Galt to Ione, 27 m.; California Northern, from Marysville to Oroville, 26½ m.; Nevada County, from Nevada City to Colfax, 22½ m.; Santa Cruz, from Santa Cruz to Vajaro depot, 21½ m.; and nine other roads, from 17 to 3½ m. in length; there being 2046 m. of railroad in the state.

The organic law of C. is very similar to that of New York and other old states. The constitution, which was adopted Nov. 13, 1849, put the then residents on the same standing as native-born citizens with regard to property. Public debts exceeding \$300,000 at one time cannot be incurred unless approved by popular vote. Voters are white male citizens, 21 years old, resident six months in the state, and 30 days in the voting district. (The 15th amendment to the federal constitution makes colored citizens also voters, but the Chinese are not permitted to vote.) Elections are biennial, on the first Tuesday in September; but judges and the superintendent of public instruction are voted for at special elections in October. A plurality is sufficient to elect. The assembly has 80, and the senate 40 members, who are paid \$10 per day for sessions limited to 120 days, and \$3 for every 20 m. of travel. The legislature meets biennially at Sacramento. The chief executive officers and annual salaries are: Governor, \$7000; lieutenant-governor, \$12 per day during the session of the legislature, and \$10 per day as warden of the state prison; secretary of state, \$4000; treasurer, \$4000; controller, \$4000; superintendent of public instruction, \$3000; adjutant-general, \$4000; and surveyor-general, \$3000. A chief justice and four associate justices of the supreme court are chosen for terms of ten years, having salaries of \$6000. The governor's veto may be overcome by a two-thirds vote in the legislature. There are county courts, each with a single judge, who also acts as surrogate, except in San Francisco. The wife is secured in both real and personal property had before or acquired after marriage. The earnings of both wife and husband are common property, but the wife's earnings are not liable for the husband's debts. If a wife be separated from her husband, her earnings and those of her minor

children are her own; she may sue and be sued alone, and, by leave of a court, convey alone; and a married woman can dispose of her separate estate by will. Homesteads to the value of \$5000 for the head of a family, and \$1000 for a single person, are exempt from levy. Insolvent debtors, resident and non-resident, can be discharged from debts upon making assignment of all their property, and publishing notice thereof. The more important penalties are: For treason, and murder in the first degree, death; murder in the second degree, and robbery from the person, 10 years to life imprisonment; manslaughter, 10 years or less; killing in a duel, 7 years or less; mayhem, 14 years or less; rape, from 5 years to life; forgery and perjury, 14 years or less. Chinese and Indians cannot testify in court against white persons, and special taxes are imposed to restrict immigration from China (but this is believed to be illegal under our treaties with China). Any rate of interest agreed upon is lawful. Open accounts are outlawed in two years; notes in four, and judgments in five, years.

This constitution was in force until 1879. In that year (Mar. 3) a state convention, which had been in session 157 days, reported a new constitution, in which there were many novel propositions and radical changes from the old organic law. The new constitution was vigorously opposed, but in the vote taken May 7 there were 77,959 in favor and 67,134 opposed, showing an affirmative majority of 10,825. The main provisions of the new constitution are the following: Trial by jury may be waived, by consent of parties, in criminal cases not amounting to felony; and in civil cases as may be prescribed by law. In civil actions and misdemeanors juries may consist of 12, or less, as parties may agree; and three fourths of a jury may decide a verdict in civil actions. No native of China, no idiot, insane person, or person convicted of infamous crime, and no person hereafter convicted of embezzlement or misappropriation of public money, may vote. After 1880, legislative sessions begin on the first Monday after Jan. 1, and are biennial. Senators (40) hold 4 years, assemblymen (80) 2 years; legislative elections are held on the Tuesday following the first Monday in Nov. Pay of members continues only 60 days; no bill can be presented after 50 days of the session have gone by except on consent of two thirds. In appropriation bills the governor may veto or approve special items. Persons holding United States offices, except post-masters who have less than \$500 salary, cannot hold offices of honor or profit in the state. No one convicted of embezzlement or defalcation of public money of the union or of any state, county, or town, is eligible for office in California. No money shall ever be taken from the state treasury for the benefit of any institution not under the state's entire control; but the legislature may grant aid to orphans, abandoned children, and aged poor. Laws shall be passed to prohibit lotteries, gift enterprises, and anything in the nature of a lottery; also, to regulate or prohibit speculative sales of stock; and all contracts for future delivery of stock are void. In elections by the legislature the members shall vote *viva voce*. Every description of direct or indirect appropriation or gift of property for the benefit of any sect is forbidden, not only to the legislature, but to the counties, cities, towns, school districts, and corporations. The public credit shall not be given or loaned in aid of any person, association, or corporation; nor shall the state or any political division thereof subscribe for stock or become an owner in any corporation. Extra compensation to public officers, agents, contractors, etc., is positively forbidden. Laws shall be enacted regulating charges for gas, telegraphing, and storage and wharfage. Bribery of a member of the legislature and lobbying with that purpose are declared felony; members proved guilty of receiving bribes are disfranchised and can never hold offices of honor or trust. Witnesses in examinations for bribery shall be compelled to testify. The governor's term is four years, salary \$6000; other state officers \$3000. The legislature may reduce but cannot increase these sums. Fees are abolished so far as these officers are concerned. A governor is ineligible for U. S. senator during his term of office. Among the judiciary provisions it is provided that after July 1, 1880, no judge of superior or supreme court shall receive salary unless he swear that no cause in his court submitted ninety days previous remains undecided. Appropriations to sectarian schools are prohibited. Counties, towns, and cities can incur debt only by the consent of two thirds of the voters at special elections. Cities and towns have power to regulate the price of water and artificial light. A stockholder in a corporation is liable to the amount of his shares for debts incurred while he is an owner. Directors and trustees are liable to stockholders and creditors for money embezzled or misappropriated. The acceptance of passes from railroads or other transportation companies by members of the legislature, or by public officers except railroad commissioners, works a forfeiture of office. Lands and improvements thereon shall be separately assessed. Cultivated and uncultivated lands of the same kind and situation shall be assessed at equal values. Tax-payers shall make return under oath of their real and personal property, and provision may be made for payment of real estate taxes by installments. Income taxes may be assessed and collected. There is a poll tax of \$2 on each male inhabitant over 21 and under 60 for the benefit of the school fund. Except in case of war, invasion, or insurrection, the legislature shall not create a debt of over \$300,000 unless for some specific object, and then provision for payment within 20 years shall be made; and such special debts shall be voted upon by the people.

The famous Chinese provisions are as follows: *Sec. 1.* The legislature shall prescribe all necessary regulations for the protection of the state, and the counties, cities, and

towns thereof, from the burdens and evils arising from the presence of aliens who are or may become vagrants, paupers, mendicants, criminals, or invalids afflicted with contagious or infectious diseases, and from aliens otherwise dangerous or detrimental to the well being or peace of the state; and shall impose conditions upon which such persons may reside in the state, and provide the means and mode of their removal from the state upon failure or refusal to comply with such conditions; provided, that nothing contained in this section shall be construed to impair or limit the power of the legislature to pass such police laws or other regulations as it may deem necessary.

Sec. 2. No corporation now existing or hereafter formed under the laws of this state shall, after the adoption of this constitution, employ, directly or indirectly, in any capacity, any Chinese or Mongolian. The legislature shall pass such laws as may be necessary to enforce this regulation.

Sec. 3. No Chinese shall be employed on any state, county, municipal, or other public work, except in punishment for crime.

Sec. 4. The presence of foreigners ineligible to become citizens of the United States is declared to be dangerous to the well being of the state, and the legislature shall discourage their immigration by all the means within its power. Asiatic coolyism is a form of human slavery, and is forever prohibited in this state, and all contracts for cooly labor shall be void. All companies or corporations, whether formed in this country or any foreign country, for the importation of such labor, shall be subject to such penalties as the legislature may prescribe. The legislature shall delegate all necessary power to the incorporated cities and towns of this state, for the removal of Chinese without the limits of such cities and towns, or for their location within prescribed portions of those limits; also, it shall provide necessary legislation to prohibit the introduction into this state of Chinese after the adoption of this constitution.

Principals and seconds in duelling or challenging to a duel are disfranchised, and cannot again hold office. The property of husband and wife shall belong separately to each. The suffrage shall be protected by adequate laws. Mechanics and laborers have property liens for the value of labor and material furnished. Eight hours is a day's work. No person shall, on account of sex, be disqualified from entering upon or pursuing any lawful business, vocation, or profession. There are no more judicial districts: every county elects a superior judge (San Francisco elects 12, six others elect two each). Three railroad districts were created, and the congressional districts were newly arranged.

At the time the vote was taken on this constitution, for and against which 145,212 votes were cast, there were 154,638 votes against Chinese immigration. But all the enactments on that subject fall to the ground, since they are in conflict with the treaty with China, and the federal constitution provides that treaties shall be the supreme law of the land.

The first votes of California (4) for president were cast in 1852 for Pierce and King; in 1856, for Buchanan and Breckinridge; in 1860, for Lincoln and Hamlin; in 1864 (5 votes), Lincoln and Johnson; in 1868, Grant and Colfax; in 1872 (6 votes), Grant and Wilson; in 1876, Hayes and Wheeler. Of high federal officers, the state has furnished one supreme court justice. (For latest statistics, see APPENDIX.)

CALIFORNIA, GULF OF, an arm of the Pacific ocean, which divides the peninsula above described from the rest of Mexico. It was originally known as the sea of Cortez, having been discovered under his auspices, and explored by himself; and it has, from its shape, been occasionally designated the Adriatic of the new world. It is 700 m. in length, and varies in width from 40 to 100 miles. At its northern extremity, it almost touches the territory of the United States, receiving therefrom the united streams of the Gila and the Colorado. The gulf contains many islands, particularly towards its head, and has long had a pearl-fishery. At the e. side of its entrance stands Mazatlan, on a river of the same name, now the most frequented port of the neighboring regions.

CALIFORNIA, UNIVERSITY OF, established in 1868 as a non-sectarian institution, an outgrowth of the college of California. The university is at Berkeley, 4 m. n. of Oakland, and occupies two buildings. In 1879, it had 38 professors and instructors, and 332 students of college grade, under the presidency of John Le Conte. The students are enrolled in separate colleges, in each of which they may pursue a regular or a special course. The college of letters maintains two courses: the regular classical, which leads to the degree of bachelor of arts, and the literary course, which leads to the degree of bachelor of philosophy. In both courses a liberal amount of time is bestowed upon the principles of modern science. All the colleges are in successful operation, including the college of letters, five colleges of science, and three professional colleges of law, medicine, and pharmacy, under regular faculties. Students of both sexes are admitted on equal terms. The university is entitled to the avails of the public lands given to the state for an agricultural college by the act of congress of 1862. Tuition is free in the university proper, but not in the preparatory department.

CALIGULA, CAIUS CÆSAR AUGUSTUS GERMANICUS, Roman emperor (37-41 A.D.), the youngest son of Germanicus (nephew of Tiberius) by Agrippina, was b. 31st Aug., 12 A.D., at Antium, and was educated in the camp, where the soldiers gave him the by-name C., from the half-boots (*caligæ*) which he wore. On the death of his brother

Drusus, he was made augur in his stead; and on the death of Tiberius (37 A. D.), who, it was suspected, had received foul-play at his hands, it was found that he had been appointed co-heir along with the grandson of Tiberius, but the senate and the people allowed C. supreme and sole authority. In the beginning of his reign, he appeared hardly likely to fulfill the threat of Tiberius, who had talked of educating C. "for the destruction of the Roman people." He was, to appearance, lavishly generous and merciful, pardoning even those who had been the instruments of cruelty against his own family. But this ostentatious magnanimity was itself a disease, an unwholesome affectation, founded on no principle, or even humanity of heart, and co-existed with the most savage voluptuousness and lust. Consequently, when illness, the result of his vicious life, had weakened his faculties, the lower qualities of his nature obtained the complete mastery. In addition to the senseless prodigality with which he commenced his career—expending in one year the enormous wealth left by Tiberius (720 millions of sesterces)—he began to manifest the most barbarous propensities. He banished or murdered his relatives, excepting his uncle Claudius and sister Drusilla (with whom he carried on incestuous intercourse); filled Rome with executions, confiscating the estates of his victims; amused himself, while dining, by having victims tortured and slain in his presence; and uttered the wish "that all the Roman people had but one neck, so that he might decapitate Rome at a blow!" To vie with Xerxes, he made a bridge of ships over the bay between Baie and Puteoli (a distance of three Roman miles and 600 paces), and celebrated the exploit by a costly banquet on the middle of the bridge, and by collecting on it great numbers of people, and causing them to be drowned. His favorite horse was stabled in a palace, fed at a marble manger with gilded oats, was made a member of the college of priests, and afterwards raised to the consulship. As a climax to all his absurdities, he declared himself a god, and had temples erected, and sacrifices offered to himself. To gratify his monstrous desires, he shrunk from no infamy; he robbed, plundered, and taxed his subjects to a degree which seems almost incredible, and when even these means proved insufficient, he established a brothel in his own palace, and sent out his slaves to solicit the public patronage for it. At length a conspiracy was formed against him, and he was assassinated 41 A. D.

CALIPH (Turk., a successor), the title of Mohammed's successors in temporal and spiritual power, from which the historians of the middle ages designated the Arab empire founded by these princes the CALIPHATE. This empire, for two or three centuries, exceeded even the Roman empire in extent. As Mohammed died without leaving any sons, a contest arose concerning the inheritance of his power, which terminated (632 A. D.) in the triumph of Abubekr (q. v.), one of his fathers-in-law, over Ali, his nephew and son-in-law. Abubekr now assumed the title of Caliphet-Resul-Allah—i. e., representative or deputy of the prophet of God. He sent forth his armies for the extension of Mohammedanism, and after several victories over the forces of the Byzantine empire, conquered Syria. He was succeeded in 634 by Omar, another father-in-law of Mohammed, by whom Egypt and Jerusalem were annexed to the caliphate. He assumed the title of Emir-al-Mumenin—i. e., prince of the faithful—a title which all subsequent caliphs retained. Othman, a son-in-law of the prophet, was the third C., and was elected by six persons appointed by Omar before his death. During his reign (644-56 A. D.), the Arabian empire grew with extraordinary rapidity, being extended into Persia, and westward along the n. coast of Africa as far as Ceuta. The Byzantine emperors recovered Egypt; but it was wrested from them again at a prodigious expense of blood. The people of Medina elected Ali-ben-Abi-Taleb as C. upon the death of Othman. The Shiites regard him as the first true imam or high-priest, and honor him and his son Hassan almost equally with Mohammed himself. Contests against rivals prevented him from doing much for the extension of the caliphate. Moawijah, the governor of Damascus, having made himself really independent during Ali's life, and having extended his power over Syria, Egypt, and part of Arabia, became C. in 661, and founded the dynasty of the Ommiades, making the caliphate hereditary. He removed the seat of the caliphate to Damascus. His armies ravaged Asia Minor, and laid siege to Constantinople, but could not take it. He made important conquests, however, in Central Asia. The caliphate did not remain long in the family of Moawijah, and it frequently happened that in one or other of the subject countries a governor raised himself to a temporary independence; and rival caliphs frequently contended for power. Abd-melek (685-705 A. D.) united all the Moslems under his dominion. Under his son, Walid I., the caliphate reached its zenith of prosperity, the Arabs conquering Turkestan in 707, Galatia in 710, and Spain in 711. Under Hesham, the progress of the Arabs in the west was arrested by Charles Martel at Tours (732 A. D.), and at Narbonne (736 A. D.). The dynasty of the Ommiades in Asia terminated with Merwan II. in 752, giving place to that of the Abbasides. But a branch of the Ommiades founded an independent caliphate at Cordova, and another founded one in Arabia, which subsisted till the 16th century. Abul-Abbas (750-54 A. D.), the first Abbaside C., signalized himself by his cruelty and the torrents of human blood which he shed. His successor, Abu-Jafar, called Al-Mansur, a patron of the arts, but a persecutor of Christians, founded Bagdad (q. v.), and removed the seat of the caliphate thither. From the beginning of the 9th c., the Arab empire, which had suffered much from corruption and internal disorganization

under the last caliphs of the Omniade dynasty, and had never completely recovered, showed increased signs of decay. Even under the C. Harun-al-Raschid, whose praises the eastern poets were accustomed so much to celebrate, independent kingdoms were established (800 A.D.) by the Aghlabides in Tunis, and the Edrisides in Fez. In 821, Taher, the governor of Khorassan, made himself independent, and established a dynasty there, and other governors of provinces followed his example. But under the C. Al-Mamun, the Arabians conquered Sicily and Sardinia, the former of which they held till it was taken from them in 1035 by the Normans; and the latter, till it was conquered by the Pisans in 1051. The C. Motassem (833-42 A.D.) was the first to employ Turkish soldiers; but the practice was followed by his successors; and the Turkish body-guard soon became a formidable power in the caliphate, and about the middle of the 9th c. assumed the right of deciding the succession to the throne. Many of the caliphs, meanwhile, were base voluptuaries, and of the others, some were of little capacity, and their power rapidly declined. Ere the middle of the 10th c., the caliphs themselves exercised a mere nominal sovereignty, whilst the emirs, like the mayors of the palace towards the close of the Merovingian dynasty among the Franks, possessed all real power. The princes of the Fatimide dynasty, which succeeded that of the Aghlabides in Tunis, having made themselves masters of Egypt in 970, assumed the title of C., so that there were now three caliphates—at Bagdad, at Cairo, and at Cordova. In the 11th c., the caliphs of Bagdad were still acknowledged as the spiritual chiefs of all the Moslems; but their temporal power scarcely extended beyond the walls of Bagdad. Bagdad itself became the prey of a Mongol horde in 1258, and the representative of the caliphs fled to Egypt, where, under the protection of the Mamelukes, who had made themselves masters of that country in 1250, he retained his title and spiritual power, which he transmitted to his successors, who continued to reside there till the Turks conquered Egypt in 1517, when the last of them was carried to Constantinople; and since that time the Turkish sultans have assumed the title of C., and claimed to be regarded as the spiritual chiefs of all the Moslems, a claim to which little respect has ever been paid except within the limits of their own empire.

CALIPPIC CYCLE. See PERIOD.

CALIPRUS, or **CALLIPPUS**, an astronomer of Greece, in the 4th c., B.C. He corrected earlier measurements of time by Meton's cycle of 19 years, which he found to be six hours too long. He made the year $365\frac{1}{4}$ days.

CALISTHENICS, physical exercise designed to promote strength and proper bodily development. The usual apparatus includes a pair of light dumb-bells, Indian clubs, stout wooden rings, a wooden staff about 4 ft. long, horizontal bars, bags of beans for throwing and catching, and two weights running upon vertical cords. The practice of calisthenics is growing among schools for girls.

CALITRI, a t. of Italy, in the province of Avellino, near the Ofanto, and about 7 m. e.n.e. of Conza. It has a pop. of 6200, who are chiefly engaged in agricultural pursuits. Sheep are reared to a considerable extent in the vicinity.

CAL'IVER was a matchlock or fire-arm about midway in size and character between an arquebuse and a musket; it was small enough to be fired without a rest or support.

CALIX TINES, a Bohemian religious sect, so named from the Latin *calix*, a cup, because they contended for giving the cup, as well as the consecrated wafer, to the laity. Their confession of faith (1421) contained the following articles: 1. That the word of God ought to be freely and regularly preached by the priests of the Lord throughout Bohemia; 2. That the eucharist in both kinds ought to be administered to all burdened with "no mortal sins," according to the language and command of the Saviour; 3. That the clergy should separate themselves from secular affairs; 4. That all "mortal sins," and especially public ones, such as debauchery and simony, and any other disorders contrary to the law of God, should be prevented or punished by those who were the lawful authorities in such matters. In other main points they were moderate followers of John Huss, and were opposed to the more extreme sect of Taborites (q.v.). Their peculiar articles of faith were conceded by order of the council at Basel (1433); and having prevailed over the Taborites in the conflict which took place at Boehmischbrod, 30th May, 1434, they became the dominant party in Bohemia, and exercised considerable influence over political affairs. Gradually, however, the C. lapsed from the severity of their four articles, while the schism of the energetic Taborites, and later of the Bohemian brethren (q.v.), rendered them completely powerless. At the beginning of the 16th c., they had ceased to possess any importance, and only served to prepare the way for Protestantism.

CALIXTUS, a name borne by three popes. The first was born a slave, and is said to have suffered martyrdom, 223 A.D. The second (d. 1124) was a son of the count of Burgundy, and a ruler of firmness. He expelled the anti-pope Gregory from Rome in 1120, stormed the castle in which he took refuge, and made him a prisoner. He also concluded the concordat with Henry V., of Germany, at Worms; broke the power of the Cenci family, and demolished their castles. The third was of the Spanish Borgia family, and his leading idea was to institute a great crusade against the Turks, in which he failed. He died in 1458, and was succeeded by Alexander VI., one of the most notorious of the Borgia family.

CALIXTUS, GEORG (properly, *Callisen*), an eminent theologian of the Lutheran church, was born 14th Dec., 1586, at Medelbye in Schleswig; studied at Flensburg and Helmstedt; and, in 1605, became professor of philosophy in the latter of these cities. Two years after, he betook himself to theology, and attracted great attention by the breadth and originality of his views. After traveling for some time in Germany, Holland, England, and France, where he made the acquaintance of the most learned men of his time, he returned to Helmstedt in 1613, and was appointed professor of theology. His genius, the depth of his knowledge, and his large experience of the world and of men, which he had acquired in his travels, developed in him a spirit of great tolerance towards all who held their religious opinions honestly, whatever these might be. Although his dissertations on the Holy Scripture, transubstantiation, communion in one kind, etc., are acknowledged by learned Catholics to be about the most solid and admirable which have been composed by Protestants against the distinctive doctrines of Catholicism, he was, on account of some statements in his work, entitled *De Præcipuis Religionis Christianæ Capitibus* (Helmstedt, 1613), which seemed favorable to Catholic dogmas, and of others in his *Epitome Theologiæ Moralis* (Helmstedt, 1634), *De Tolerantia Reformatorum*, etc. (Helmstedt, 1658), which approached too near to the Reformed or Calvinistic standpoint, declared guilty of abominable heresy by the adherents of the letter of the Concordienformel—i.e., the orthodox and dogmatically rigid Lutherans. C. felt keenly that the polemical harshness of Lutheranism was a serious obstacle in the way of a great Catholic Christianity, and that Protestantism must assume another form before it could hope to become the religion of Europe. Under this conviction, B. endeavored to show that the oldest and most fundamental articles of the Christian faith—viz., the facts embodied in the "Apostles' Creed"—were common to all Christian sects. In subsequent dissertations, having stated that the doctrine of the Trinity was less distinctly taught in the Old than in the New Testament, and that good works were necessary to salvation; and finally, at the religious conference of Thorn, in 1649, whither he was sent as a mediator by the elector of Brandenburg, having been on more intimate terms with the Calvinistic than the Lutheran theologians, C. was accused of apostasy. Fortunately, however, he had powerful friends, who stood firmly by him, and through their help he was enabled to retain his professorial chair till his death, on 19th Mar., 1656.

CALL, a term often used in reference to various theological and ecclesiastical subjects.

—1. The command or invitation to believe in Jesus Christ, is designated the *call of God*, or the *gospel call*. Calvinistic theologians make a distinction between a *general call* and a *special* or *effectual call*. The former is addressed, they say, to all to whom the word of God comes; but it is insufficient of itself to induce any man to the act of faith, and requires, in order to its efficacy, that it be accompanied by the special and irresistible grace of the Holy Spirit. They are careful, however, to state that the general or outward calling by the word always precedes and accompanies the special and effectual calling by the Spirit. The notion of an inward call by the Spirit of God in the soul, unconnected with outward calling by the word, belongs not to Calvinistic, but to mystic theology.—2. A call to office in the church, and particularly to the ministry of the gospel, is regarded by Christians generally as proceeding from God; and the church of England requires of candidates for ordination an express profession that they trust they are so moved of the Holy Ghost.—3. A call by the people who are to be under the pastoral care of a minister has been generally regarded in the Christian church as necessary to the establishment of the pastoral relation. But there have been great differences of opinion as to what constitutes a sufficient call, and great differences of practice with regard to it. Some of the principal ecclesiastical dissensions in Scotland have had their origin in this question. The election of a pastor by the *Christian people* of his *parish* or *congregation*, has been contended for by many as the true call, or the best kind of it; others, approving of patronage with certain limitations, contended no less earnestly for the right of the people to be consulted, so that without their concurring by a call, the patron's presentee should not be held entitled to be inducted into the pastoral office; and according to the practice of the church of Scotland, this concurrence was always at least formally sought. Questions concerning the call and its proper value, supposed to have been determined by the earl of Aberdeen's act, passed when the *disruption* of the church of Scotland took place in 1843, were not finally settled until the passing of the act for the abolition of patronage (1874), which gives the right of calling to the congregation. See SCOTLAND, CHURCH OF; FREE CHURCH OF SCOTLAND; and PATRONAGE.

CALL, a stipulated sum to be paid towards a share in a joint-stock undertaking. For example, in a £10 share, there are usually at least four calls of £2 10s. each, the calls being made at intervals of not less than three months.

CALL, a military musical term meaning a signal on the trumpet.

CALL is a metal whistle used by the boatswain and his mate on shipboard. Various strains or kinds of sound produced denote signals or orders for hoisting, heaving, lowering, veering, belaying, letting-go, etc. These sounds are as much attended to by seamen, as those of the drum, bugle, and trumpet are by soldiers. At one time, a gold call, with a chain, used to be the badge of an admiral.

CALLA, a genus of plants of the natural order *araceæ*, or, according to some botanists, of the natural order *orontiacæ*, which is distinguished from *araceæ* only by having

hermaphrodite flowers. The genus *calla* is characterized by a flat spathe (q.v.), within which is a cylindrical spadix (see SPATHE) covered with naked flowers, appearing as a mere mixture of stamens and pistils, and a one-celled ovary with 6 to 8 erect ovules. The known species are few, and natives of very different climates. *C. palustris* is found in swamps in Europe, Siberia, and North America, but not in Britain. It has a creeping root-stock, and heart-shaped, stalked leaves, the midrib of which is prolonged beyond the blade into a point; the spathe is white, and the spadix yellow. The root-stock is extremely acrid and caustic; but being deprived of its acidity by grinding, boiling, and macerating, is made by the Laplanders into a kind of bread called *missebroed*, which they hold in high estimation.—The well-known and beautiful *Richardia Ethiopica* was formerly included in this genus, and is often still called calla.

CALLAHAN, a co. in n.w. Texas, not settled; 900 sq. miles. It has a rocky and broken surface, with little timber, but good for grazing.

CALLANDER, a village in Perthshire, on the left bank of the Teith, 16 m. n.w. of Stirling. It lies in a beautiful and romantic situation, surrounded by high mountains and Highland lakes. Hence, it is much frequented by tourists, who make this place a center to visit Benledi, the Trosachs, the Bracklin falls, and Lochs Lubnaig, Vennachar, Achray, and Katrine. Pop. '71, 1870.

CALLAO, the port of Lima, the capital of Peru, connected with that city by a railway of 6 m. in length. It stands in lat. 12° s., and long. 77° 13' w. Fine harbor-works, with extensive pier and dock accommodation, were completed in 1875. The roadstead is large, free from rocks, and safe, being sheltered by the island of San Lorenzo. The exports are guano, specie, copper, cotton, bark, and hides. The value of exports and imports is about £6,000,000 annually. C. contains about 20,000 inhabitants. The present C. dates only from 1746, when the original city was submerged and destroyed by an earthquake.

CALLAWAY, a co. in s.w. Kentucky, on Tennessee river; 450 sq.m.; pop. '70, 9410—812 colored; in '80, 13,333. The surface is varied, and soil fertile, producing corn, tobacco, etc. Co seat, Murray.

CALLAWAY, a co. in e. Missouri, on the Missouri river; 743 sq.m.; pop. '70, 19,202—3434 colored. The soil is mainly prairie, and fertile, producing corn, tobacco, potatoes, butter, wool, etc. Co. seat, Fulton.

CALL TO THE BAR is the formal expression by which the admission of law-students to the rights and privileges of the degree of barrister in England and Ireland is publicly announced. In Scotland the corresponding expression is *Passing Advocate*. See **BAR- RISTER**; **INNS OF COURT**; and **ADVOCATES, FACULTY OF**.

CALLCOTT, Sir AUGUSTUS. This name has been erroneously spelled CALCOTT (q.v.).

CALLCOTT, JOHN WALL. See CALCOTT.

CALLEJA, Don FELIX DEL REY, 1750-1820; count of Calderón, commanding the Spanish forces in Mexico during the Hidalgo insurrection. In Jan., 1812, he captured the fortress of Zitacuaro and murdered all the inhabitants; and in the same year he captured Hidalgo's successor, the priest Morelos, who was at once shot. For these acts he was made viceroy and ennobled.

CALLERNISH, a district on the w. coast of the island of Lewis, about 16 m. from Stornoway, remarkable for its circles of standing stones (q.v.). There are four circles, at no great distance from one another, but without any visible relation. The principal one, is of a more than usually elaborate design. "A double line of upright stones run parallel to each other in a northerly direction, while a single line of similar stones is projected from the s., e., and w. points, thus giving a cruciform figure to the structure. A stone of larger dimensions than any of the others occupies the center of the circle, and completes the whole. . . . That the position was chosen and laid down from astronomical observation, can easily be demonstrated by visiting the spot on a clear night, when it will be found that by bringing the upper part of the single line of stones extending to the south to bear upon the top of the large stone in the center of the circle, the apex of that stone coincides exactly with the pole-star. . . . The stones themselves are not columnar, or shaped into any form; they are simply broad, flat blocks of gneiss—the all-prevailing rock from the Butt of the Lewis to Barra Head. The following are their dimensions: diameter of circle, about 40 ft.; length of west line, 43 ft.; length of east line, 38 ft.; length of south line, 69 ft.; length of avenue, 270 ft.; breadth of avenue, 27 ft.; average height of stones, 6 to 8 ft.; height of center stone, 12 feet. There are 13 stones in the circle, including the center one, 19 in the avenue, 5 in each of the east and west, and 6 in the south arm. The measurements of height are taken from the present level; but it must be borne in mind that there is a bed of peat-moss, 4 or 5 ft. thick, through which the stones rise from the clay beneath; this gives a height of 16 to 17 ft. to the center stone, and from 10 to 13 ft. to the others, exclusive of the foundation."—*Notice of the Stone Circle at Callernish*, communicated to the society of antiquaries of Scotland, by Mr. Henry Callender, Mar., 1857.

CALL OF THE HOUSE is an imperative summons to every member of parliament of either house on some particular occasion, when the sense of the whole house is deemed

necessary. In the *house of lords*, when any urgent business is deemed to require the attendance of the lords, it has been usual to order the house to be called over; and this order has sometimes been enforced by fines and imprisonment upon absent lords. On some occasions, the lord chancellor has addressed letters to all the peers, desiring their attendance, as on the illness of George III., 1st Nov., 1810. The most important occasion on which the house was called over, in modern times, was in 1820, for the trial of queen Caroline.

When the *house of commons* is ordered to be called over, it is usual to name a day which will enable the members to attend from all parts of the country. The interval between the order and the call has varied from one day to six weeks. If it be really intended to enforce the call, not less than a week or ten days should intervene between the order and the day named for the call. The order for the house to be called over is always accompanied by a resolution "that such members as shall not then attend, be sent for, in custody of the serjeant-at-arms." And it was formerly the custom to desire the speaker to write to all the sheriffs to summon the members to attend. On the day appointed for the call, the order of the day is read and proceeded with, postponed, or discharged, at the pleasure of the house. If proceeded with, the names are called over, according to the counties, which are arranged alphabetically. The members of a county are called first, and then the members for every city or borough within that county. The counties in England and Wales are called first, and those of Scotland and Ireland in their order. This point is mentioned, because it makes a material difference in the time at which a member is required to be in his place.—See *May's Proceed. in Parl., on Attendance of Members.*

CALLICHTHYS (Gr. *kalos*, beautiful, *ichthys*, a fish), a genus of fishes of the family *siluridae* (q.v.), having the body almost entirely covered by four rows of large, hard, narrow, scaly plates, two rows on each side. The head is also protected by a sort of helmet. The mouth is small, the teeth very small; two long barbules hang from each angle of the mouth. The species of this genus are natives of warm climates, particularly of South America. They are interesting because, when the streams or pools which they inhabit dry up, they make their way across the land to some other piece of water, even although at a considerable distance. They also sometimes bury themselves in the mud of wet meadows, out of which they are dug. They have no special organs for carrying a supply of water with them, like the climbing perch, but are supposed to retain a little between the plates of their body. A still more interesting part of the natural history of these fishes is their making regular nests, generally of leaves, in which they deposit their eggs, near the margin of the water, at the beginning of the rainy season, the male and female uniting in watching them until they are hatched. These habits are shared by the species of the allied genus *doras*, in which the lateral plates are broader, keeled, and each ending in a spine.

CALLICRATES, a Greek architect in the 5th c. B.C., who, assisted by Ictinus, was the builder of the Parthenon.

CALLICRATIDAS, the successor of Lysander in command of the Lacedemonian fleet against the Athenians, 406 B.C. After two successful battles he was defeated in a third, thrown overboard, and drowned.

CALLIERES BONNEVUE, LOUIS HECTOR. Chevalier de, 1639-1703; a French army officer, governor of Montreal in 1684, and in 1687 leader of the advance of the forces invading the lands of the six nations in New York. He visited France to urge the seizure of the city of New York as a security for French supremacy in Canada. In 1669, he was made governor-general of Canada.

CALLIGONUM, a genus of plants of the natural order *polygoneæ* (q.v.), having a quadrangular fruit (*achenium*, q.v.), winged at the angles. The best known species is *C. pallasia*, a succulent shrub found on the sandy steppes near the Caspian sea, and in the lower part of the basin of the Volga, where its acid fruit and its also acid shoots often serve to allay the thirst of the Kalmucks and of weary travelers. Its root strikes deep into the sand, is swollen at its upper part, and when cut there, gives out a nutritious gum resembling tragacanth (q.v.), which is also obtained by pounding and boiling it, and on which the Kalmucks feed in times of scarcity.

CALLIMACHUS, an eminent poet, grammarian, and critic of the Alexandrian period, flourished about the middle of the 3d c. B.C. He was of a distinguished family at Cyrene, in Libya; taught grammar and belles-lettres in Alexandria; was a favorite of Ptolemy Philadelphus, and his successor Ptolemy Euergetes; and was made principal librarian of the Alexandrian library. He wrote many works on the most various subjects (Suidas mentions 800), but only fragments are extant; nor have we many of his poems; but the poems which we have, bear the marks of an age when the artificial had obtained a preference over the natural.

CALLIMACHUS, an architect and artist of Greece, who lived about 400 B.C., and is said to have been the originator of the Corinthian column.

CALLING THE DIET is the Scotch term for *arraignment* (q.v.), although the forms are different. In Scotland, excepting in cases of high treason, there is no grand jury, but the procedure is briefly as follows: Before a prisoner can be tried, a written or printed

copy of the indictment preferred against him must have been served 15 days before the trial, with a copy of the list of witnesses to be examined against him, and also of the jury panel. When, therefore, he is placed at the bar of the court, and called on to plead, he is presumed to know the nature of the charge made against him. But if it be desired by him, or by his counsel, the clerk in the first instance reads the indictment aloud in open court—the same being a well-prepared syllogistic statement of the facts, which the prosecutor is prepared to prove. He is then called upon to state his objections to the relevancy, and to have such relevancy disposed of by the court, before being called on to plead to the fact. If the judgment of the court is in favor of the objection, the prosecution for the time fails, and the prisoner is sent back to jail, to abide another indictment, unless the prosecutor chooses to abandon the case against him altogether. See INDICTMENT, VERDICT, DEFENSE.

CALLINGER, one of the hill-forts of Bundelcund (q.v.), elevated about 700 ft. above the adjacent plain, and separated from a neighboring range of mountains by a ravine of 1200 yards in width. It is in lat. 25° n., and long. 80° 32' e., being 112 m. to the s.w. of Allahabad. From its position and size, C. must at one time have been a place of great strength. It was stormed by the British in 1812. At the s.e. base of the rock stands a town of the same name, which, though it is now much decayed, yet bears testimony to its ancient extent and grandeur. The locality is famous for its excavated temples of Siva.

CALLINUS OF EPHEBUS, reputed to have been the earliest of the Greek poets, lived about 700 B.C. One of his elegies has been preserved to the present time.

CALLIONYMUS. See DRAGONET.

CALLIOPE (i.e., the sweet-voiced), was, according to the ancients, the first of the Muses (q.v.), and presided over epic poetry, or over poetry in general. She was said to be the mother of Orpheus, of the Sirens, etc. She was usually represented with a style and wax tablets.

CALLIPERS, a kind of compasses with curved legs, used by turners and other workmen for measuring the diameters of cylindrical, spherical, and other curved work. The C. are laid over the work, and opened or closed until both points just touch the periphery; then the C. are laid upon a rule, and the extent of their opening measured, or the size is compared with a pattern.

CALLIRHOË, a fountain near Athens, called the fountain of nine springs, because its waters were distributed in that number of channels.

CALLISTEIA, a Grecian festival at which a prize was awarded to the most beautiful woman. But among the Elians men were the competitors, and the victor received a suit of armor which he dedicated to Minerva.

CALLISTHENES, of Olynthus, was the son of Hero, a cousin of Aristotle. C. was b. about 360 B.C.; he was educated by Aristotle along with Alexander the great. He devoted himself to the study of natural and political history, and accompanied Alexander the great in his expedition to India. He incurred the displeasure of the courtiers and royal favorites, and of Alexander himself, who was displeased by his remonstrating against his intended assumption of divine honors, and in general by his bold, indiscreet, outspoken ways; and he was put to death on a pretended charge of treason, 328 B.C. Only a few fragments of his historic works remain, and these are not valuable. The *History of Alexander* ascribed to him, of which there are several MSS. in the Paris library, is evidently a production of the 7th c., and rather a romance than a history.

CALLISTRATUS, an orator of Athens whose eloquence led Demosthenes to devote himself to public speaking. For surrendering Oropus (after a heroic defense) to the Thebans, he was condemned to death, 361 B.C., but he fled to Macedonia, where he founded the city of Datum, afterwards called Philippi. At a later period he returned to Athens and was put to death.

CAL LITHRIX. See SAGOIN.

CAL LITRIS. See SANDARACH.

CALJOSITIES. See CORNS.

CALLOT, JACQUES, one of the most eminent artists of his time, was b. at Nancy, 1592. Proceeding to Rome, he commenced drawing and engraving under Thomassin in his eighteenth year. He next went to Florence, where, by numerous spirited etchings, he gained great fame, and engraved for Cosmo II., grand duke of Tuscany, a series of plates of court-festivals, etc. When his patron died (1621), C. returned to his native place, and increased his reputation by a copious series of etchings, including six plates of the siege of Breda. By order of Louis XIII., who invited C. to Paris, etchings of the sieges of Rochelle and the Ile Rhé were executed; but C. refused to commemorate by art the capture of his native town, and, declining the pension offered by the king, returned to Nancy, where he died, 1635. His activity as an artist was marvelous. Of his engravings, 1800 are still preserved at Dresden. As helps to a vivid conception of the manners, conditions of life, events, etc., in the 17th c., they are invaluable. C.'s "Misères de la Guerre," a series of 18 plates, are especially celebrated.

CALLUNA. See **HEATH.**

CALLUS. This term was employed in old surgical works, and is still used popularly, to indicate the exuded material by which fractures of bones are consolidated together. If the broken ends are accurately adjusted to each other, there is no projection of C., but merely a slight deposition of it between the two surfaces; if, however, the adjustment is not accurate, the C. is effused in such quantity as to fill up any interspaces that may exist, and as often to form a considerable hard swelling round the seat of the fracture; any excess is, however, usually absorbed during the last stage of the repair of a fracture. When the broken ends are allowed to move upon each other—which, of course, should be always prevented, if possible—a ferule of new bone, encircling both fragments for some little distance, so as to splice them together, till they are united by a permanent C., is formed; this is termed a *provisional callus*.

CALMAR. See **KALMAR**, *ante*.

CALMET, AUGUSTINE, an exegetical and historical writer, and learned Benedictine, was b. at Mesnil-la-Horgue, near Commercy, Feb. 26, 1672, and, in 1689, entered the order of Benedictines. In 1698, he was appointed teacher of philosophy and theology in the abbey Moyen-Moutier; in 1704, sub-prior of a convent of learned monks at Münster, in Alsace; and in 1706, he went to Paris, to superintend the publication of his *Commentary on the Bible*. He was afterwards appointed prior at Lay (1715), abbot of St. Leopold (1718), abbot of Senones in Lorraine (1728), and died at Paris, Oct. 25, 1757. His exegetical writings have been commended and studied with advantage by both Roman Catholics and Protestants. The *Commentary on the Bible* (23 vols., Paris, 1707-16), though marked by the author's deficient knowledge of the oriental languages, contains valuable researches in biblical antiquities. C.'s *Historical and Critical Dictionary of the Bible* (4 vols., Paris, 1722-28) was translated into English, German, and other languages, and has passed through many editions. His other works—a *History of the Bible*, and of the *Jews* (1718), and a *Universal History* (1735-71)—are mere compilations; but his *History of Lorraine* is founded on original researches. Solid criticism and vigorous intellect are wanting in all his works.

CALMS, or **CALM LATITUDES**, are those parts of the ocean, near the equator, which are subject to total absence of wind for long periods together. The part of the ocean where C. are most looked for, is between the region of the trade-winds and that of the variable winds. See **WINDS**. It is almost as much dreaded by seamen as a region of storms, for the ship is unnavigable; and during a calm of many weeks, food and water may be nearly exhausted, at a point too far from land for boats to reach it. Where a calm occurs unexpectedly, it is likely to be followed by violent storms.

CALMUCKS. See **KALMUCKS**.

CALNE, a parliamentary borough and ancient t. of Wiltshire, on the river Marden, 31 m. n.w. of Salisbury. It lies in one of the many valleys of the chalk escarpment of this part of England, with the plateau of the Marlborough downs and Salisbury plain on the e. and south. In 1863, a branch line was opened to C., 6 m. from the Chippenham station of the Great Western railway. The principal industry is the curing of bacon; and there are also flax, paper, and flour mills. The manufacture of woollens, formerly of importance, is now almost extinct. There is also a weekly corn-market. Pop. of the town in 1871, 5315. The parliamentary borough, formerly returning two members to parliament, but now only one, includes part of Blackland and Calstone. Many Roman remains have been found here. The West-Saxon kings had a palace at Calne, but no traces of it now remain. At a synod held here by St. Dunstan in 977, relative to the celibacy of the clergy, the floor of the room in which the synod sat gave way, precipitating all to the ground but St. Dunstan, who presided. On an almost perpendicular declivity 3 m. e. of C. is the figure of a *horse*, 157 ft. long, in a spirited attitude. It was cut out in white chalky ground in 1780 by Dr. Allsopp, and is visible 50 m. off. Dr. Priestley resided at C. 1770-80.

CALO'EE. See **BOEHMERIA**.

CALOMARDE, DON FRANCISCO TADEO, Count, a Spanish statesman, was b. in 1775 at Ville, in Aragon. He studied at Saragossa, where he passed as an advocate. After the expulsion of the French, and the return of Ferdinand VII. in 1814, C. was among the first to hurry to Aragon, and do homage to him as an absolute monarch. As a reward of his obsequious celerity, he obtained the highest office in the *secretaria general de Indias*, but lost it on account of accepting a bribe. On the restoration of the constitution in 1820, he unsuccessfully courted the favor of the liberals; but when the French army in 1823 enabled the king once more to rule despotically, C. was appointed secretary of the *cámara del real patronato*, one of the most influential offices in the kingdom. Not long after, the king made him minister of justice. While he held this function, he persecuted the liberals with cold-blooded savageness, recalled the Jesuits, re-opened the monasteries, and closed the universities. He also secretly favored the party of Don Carlos; but, on the other hand, by treating any unseasonable outbreak with a strictness bordering on cruelty, he preserved himself from the suspicion of being implicated in their schemes. In 1833, when Ferdinand was supposed to be on his death-bed, he was prevailed on by C. to re-introduce the Salic law, by which Christina

was excluded from the throne, and Don Carlos, the favorite of the absolutists, appointed his successor. This excited the hatred of the nation; and Ferdinand recovering, abolished the law. To avoid imprisonment, C. fled to France. He died at Toulouse in 1842.

CALOMEL is the popular name given to one of the compounds of mercury (Hg) and chlorine (Cl), and known to scientific chemists as the subchloride of mercury (HgCl). It is prepared by taking two equal portions of mercury, dissolving one portion in hot concentrated sulphuric acid (SO₃), which forms sulphate of mercury (HgOSO₃), thereafter adding the second part of the metal, and triturating the whole in a mortar till the metal becomes incorporated with the sulphate of mercury. This mixture is then added to one half its weight of common salt (NaCl), and heated in a retort, when C. sublimes, and condenses in the cool part of the receiver, as a fine white powder. A minute portion of corrosive sublimate which accompanies it, is removed by washing with water. C. is very dense. It is not soluble in water, and sparingly so in acids. It turns black on the addition of lime-water, potash, soda, or ammonia; and when heated in an iron spoon, or on a knife, it does not char, but rises in vapor, sublimes unaltered, and readily condenses again on any cool surface held near it. Although C. has been more used in British practice than any other preparation of mercury, it is not known to have been employed before the 17th century. Its medicinal virtues will be treated of with the other mercurials. See MERCURY.

CALONNE, CHARLES ALEXANDRE DE, controller general of finance in France under Louis XVI., was b. Jan. 20, 1734, at Douay. Possessing superior abilities, he studied law, and having filled successively various offices, was made, in 1783, controller general of the treasury. In this capacity he soon gained favor among the courtiers, who had complained of the parsimony of Turgot and Necker. C., though he found French finance in a deplorable state, was determined not to seem poor, gave brilliant entertainments, paid off the debts of his patron the count of Artois, supplied the queen with sufficient pocket-money, granted pensions and gratuities to his supporters and favorites, paid off arrears, and purchased the residences of St. Cloud and Rambouillet! His means of raising money were perfectly simple—he borrowed, anticipated, issued chancery-edicts, and prolonged and augmented extraordinary taxations in a style never known before. The parliament resisted these measures, but C., backed by royal authority, carried them into execution. The crisis necessarily arrived; and in 1786, when the people could bear the extraordinary taxation no longer, C. advised the king to convoke the assembly of the notables, and proposed to abolish the privileges (exemption from taxes) of the noble and wealthy, to take the duty off salt, to abolish *socage* (feudal or compulsory service to the lord of the manor), and to distribute the burden of taxation more equally. The people and the aristocracy demanded a convocation of the states-general, instead of the assembly of the notables; but C. boldly proceeded with his plan, opened the assembly of the notables, Feb. 2, 1787, and in a pleasant and florid oration, described the general prosperity of French industry and commerce, and brought his speech to a climax by confessing that the annual deficit of the treasury had risen to 115 millions of francs, and that during the time from 1776 to 1786, the government had borrowed no less a sum than about 1250 millions! The notables, instead of proceeding with C.'s plan of reorganization, demanded from him a statement of accounts. Not being able to give this satisfactorily, he was stripped of his dignities, and banished to Lorraine. After this, C. resided chiefly in England, until in 1802 he obtained from Bonaparte permission to return to France, where he died, in very embarrassed circumstances, Oct. 30, 1802.

CALOPHYLLUM (Gr. beautiful leaf), a genus of trees of the natural order *guttifera* (q.v.), natives of warm climates. Some of the species yield valuable timber, as *C. angustifolium*, the PINEY TREE, which grows at Penang, and in the islands to the eastward of the bay of Bengal, and furnishes the beautiful straight spars called *peon*. The resinous products of some species are valuable, and among them are some of the substances known by the name of *tacamahaca* (q.v.). *C. inophyllum*, which yields true East Indian *tacamahaca*, is a very large and beautiful umbrageous tree, often planted for its shade and the fragrance of its flowers, which are white and in loose axillary racemes. It is one of the most valuable timber-trees of the South Sea islands. The timber resembles mahogany, being of equally close texture, although of lighter color, and very durable. The leaves are oblong and obtuse; the fruit—which in all this genus is a globose drupe or stone fruit—is about the size of a walnut; and a fixed oil is expressed from its kernel, which is used for lamps, etc. A similar oil is expressed from the seed of *C. calaba*, the CALABA TREE of the West Indies, which also has white sweet-scented flowers, and of which the timber is used for various purposes, particularly for staves and cask-headings.

CALORIC, a term for heat (q.v.).

CALORIC ENGINE. This was the name given by capt. Ericsson to his latest *air-engine*. There seems no reason for the change of name, unless it were meant to distinguish it from the previously well-known, though hitherto unsuccessful air-engines of the Messrs. Stirling. We shall in this article treat air and caloric engine as synonymous terms.

It is a well-known law, applicable to all thermo-dynamic engines, that (presupposing

the merely mechanical part of the machine to be perfect) the heat converted into work bears the same proportion to the total heat given to the fluid that the range of temperature bears to the highest *absolute* temperature of the fluid. Thus supposing an engine to receive steam* at the temperature of 275° F., and discharge it at that of 120° F., the fraction of heat which it can convert into work will be $\frac{275-120}{275+461}$ or about 21 per cent

of the total heat of the fluid. This proportion would be, of course, greatly reduced in practice, owing to imperfections in the machinery, but these being equally likely to occur in all prime movers, we need not consider them here. The *lowest* limit of temperature available being practically constant, fixed either by the temperature of the atmosphere, or that obtainable in a condenser, it follows that greater economy can only be looked for in the direction of increase of initial temperature. In ordinary steam-engines, in which the pressure and temperature increase simultaneously, the latter is limited by the former, which in its turn is kept, by considerations of safety, comparatively low. When, however, *superheated* steam (steam to which additional heat has been imparted without the corresponding addition of pressure) or heated air is used, the temperature is limited only by the power of the metals composing the machine to resist the destructive action of heat, or the chemical action of the fluid at that temperature. Heated air possesses the advantage over superheated steam as a motive power, that with it an explosion, in the usual sense of the word, is rendered almost impossible, and that, if one were to occur, it would be comparatively harmless. It also, of course, enables the boiler to be dispensed with.

Air-engines, in their principal working parts, are very similar to ordinary steam-engines. The heated air is introduced into a cylinder, in which works a tightly-fitting piston, which is thus compelled to move up and down, and transfers its motion to a revolving shaft by means of a piston and connecting rod in the usual manner. The motion of the piston results in all cases from the expansion of the heated air; the air is heated by means of a furnace, is introduced below the piston, raises it, and then is allowed to escape into the atmosphere. Air-engines are almost invariably single-acting; they are sometimes worked simply by heated air, and sometimes with the air which, having passed through the furnace, is mixed with all the gaseous products of combustion. The latter method has the immense advantage that it utilizes the heat which would otherwise be rejected into the chimney. The total efficiency of the machine is thus increased, although the efficiency of the engine proper, between the given pair of temperatures, remains the same.

The more heat carried away by the discharged air—the higher its temperature, in other words—the smaller evidently is, *ceteris paribus*, the range of temperature of the machine, and the less, therefore (as already explained), will be its efficiency. The distinctive principle of the Messrs. Stirling's air engine, as of the later C. E., consists in utilizing a great part of this wasted heat, and thus economizing fuel. This is effected by means of a "regenerator," or, more properly, "economizer," consisting of a chamber filled with metallic sieves of wire-gauze, through which the hot air is made to pass *outwards* from the cylinder, after having performed its work on the working piston of the engine. As much of the heat of the escaping air is taken up by the regenerator, and its temperature thus reduced, the range of temperature of the machine is correspondingly increased. The fresh air entering the cylinder for the next stroke was compelled to pass *inwards* through the regenerator, and abstracted from it the heat left in it. In this way it did not require to receive so much heat in the furnace as would otherwise have been the case, and thus economized fuel.

This method of preventing waste of heat was first discovered by the Rev. Dr. Stirling, who obtained a patent for it in 1816. In working with air at the ordinary pressure of the atmosphere, however, the engine was found to require to be of large dimensions as compared to a steam-engine of the same power; and in order to obviate this objection, compressed air was used, the idea originating with Mr. James Stirling, C.E. Several other difficulties were successfully surmounted by the Messrs. Stirling, and eventually two improved engines were constructed, one of which was tested to fully 40 horse-power. This latter engine did all the work of the Dundee foundry company regularly for upwards of 3 years, during which period they employed no other motor. At the end of this period it was laid aside, principally owing to the repeated failure of one of the heating vessels.

Capt. Ericsson, in his attempt to introduce his C. E. in the ship which bore his name, experienced precisely the same difficulties and disappointments, and tried nearly the same remedies as the Messrs. Stirling. There seems little doubt, however, that he actually believed his "regenerator" was to make the *same heat* do work over and over again—to be a kind of perpetual motion—and under these circumstances it is not to be wondered at that his machines (notwithstanding some not very creditable maneuvering on the part of their upholders) entirely failed, and that in 2 years (1855) they were replaced by steam-engines.

Air engines have recently been constructed, in which the solar rays, concentrated by

* The law is the same for steam, air, or any other fluid whatever.

means of an arrangement of mirrors, are utilized as the source of heat. These have been called *solar engines*.

CALORIMETER, a measurer of the degree of heat (q.v.).

CALORIMOTOR, a powerful galvanic battery devised by Dr. Hare. He placed a sheet of non-conducting substance, as paste-board, between a sheet of copper and another of zinc, rolled the whole together, and plunged the bundle into a barrel of acidulated water. As there was but one pair of plates, the intensity of the electricity produced was feeble, but because of the great surface, the quantity was large; effects which depend upon quantity, as heat, were produced in an intense degree. The same result is now attained by coupling the elements of many small cells in such a way that all the positive plates shall be united in one, and the negative plates in another.

CALOTROPIS. See MUDAR.

CALOTTISTES (*Le Régiment de la Calotte*), a society of witty and satirical men, in the time of Louis XIV., who were headed by two officers in the king's body-guard, named Torsac and Aimon. Their name was taken from the word *calotte* (a "small cap," worn by monks over the tonsure), and their amusement consisted in sending to any public character who had exposed himself to ridicule, a "patent," authorizing him to wear the *calotte* as a covering for the weak part of his head. The armorial bearings of the *Régiment de la Calotte* consisted of various symbols of folly, with the motto, "*C'est régner que de savoir rire.*" When Torsac, its first "generalissimo," died, the society, which occupied a position of satirical hostility to the French academy, drew up a burlesque funeral oration, manufactured out of the pompously eulogistic phrases that the academicians were in the habit of using. As the society became audacious, and did not spare even royalty itself, it was dissolved by the minister Fleury. The *Mémoires pour servir à l'Histoire de la Calotte* (Basel, 1725) is an amusing little book. During the restoration, the title *Régime de la Calotte* was applied to the priestly administration of affairs.

CALOTYPE PROCESS (Gr. *kalos*, beautiful, *typos*, impression), a title comprehending a variety of methods for the production of negative photographs on paper; and so named by the inventor, the late Dr. H. Fox Talbot, who exhibited the result of his experiments in the year 1840. The principle involved in the C. P. depends on the susceptibility to the action of daylight of a surface chemically prepared, and the practice consists in the preparation, and exposure in the camera, of a sheet of paper, having on one surface an even and finely divided layer of iodide of silver, nitrate of silver, and an organic acid; the image obtained on this surface being subsequently developed with gallo-nitrate of silver. It will be unnecessary here to describe the various modifications which have been introduced with the object of imparting a high degree of sensibility to the paper; one process—the best—will suffice to describe the manipulation.

Good English paper, sized with gelatine, should be chosen, the foreign starch-sized papers being unsuitable, on account of the solutions sinking in too deeply, and thus impairing that sharpness of outline which should be possessed by a good negative. The paper is then floated on one side, and for a moment only, on a solution of iodide of silver in iodide of potassium; prepared by adding freshly precipitated iodide of silver to a strong solution of iodide of potassium. It is then dried, and plunged into a dish containing distilled water, which, by removing the soluble iodide of potassium, precipitates the iodide of silver in an even and finely divided condition over the whole surface of the paper, which in this state will keep good for twelve months. It is now ready to receive the *sensitive coating*; this operation, which is called *exciting* the paper, is performed in the following manner: Two solutions are prepared—one, a saturated solution of gallic acid in cold distilled water, called solution A; the other, a solution of 50 grains of nitrate of silver in 1 oz. of distilled water, to which 1 dram of glacial acetic acid has been added; this is called solution B. The iodized paper obtained as above is now laid on a board having a piece of clean blotting-paper on it a little larger than the paper to be excited, and the following solution brushed over it with a clean Buckle's brush: distilled water, 1 oz.; solution A, 15 drops; solution B, 15 drops. This mixture, prepared in a chemically clean glass vessel, should be freely applied, and the excess absorbed by clean blotting-paper. The paper is now ready for exposure in the camera, and may be at once placed in the dark slide; or a stock may be thus sensitized and preserved between folds of blotting-paper until required for use. The *time of exposure*—varying from three minutes to a quarter of an hour—is determined by the diameter and focal length of the lens employed, the aperture of the diaphragm or stop, and the amount of light prevailing at the time. The *development of the latent image*, an operation which, like the preceding, is, of course, conducted in a room illuminated only by yellow light, is accomplished by applying freely and uniformly over the whole surface solution A; and when the image begins to appear, applying a second quantity, to which a few drops of solution B have been previously added, to increase the intensity. The whole operation of development occupies about a quarter of an hour; and when the details are fully out, the picture should be washed with water, and *fixed*, by immersion in a solution of 1 part of hyposulphite of soda to 4 parts of water; it is then again freely washed in frequent changes of water during several hours: it is lastly *dried* and *vared*; when it may be regarded as a finished negative, from which positive prints may be obtained, having the lights and shadows as in nature. See POSITIVE PRINTING.

CALOVIVS, ABRAHAM, 1612-86; a Lutheran minister, rector at Dantzic, and professor at Königsberg and Wittenberg. He was a strong controvertist, and a vigorous supporter of his sect.

CALOYERS, a general name for the monks of the Greek church. The name is a corruption of two Greek words, *kalos* and *geron*, and signifies "good old men." The C. follow the order of St. Basil, and are divided into three ranks: the novices, called *archari*; the ordinary professed, called *microchemi*; and the more perfect, called *megalochemi*. It is always from among them that bishops and patriarchs are chosen, because they are generally members of the most distinguished families of the upper and middle classes. The C. also furnish the only learned theologians in Greece at the present day. Their monasteries are very numerous. The most celebrated in Asia is that of Mt. Sinai, founded by the emperor Justinian, and endowed with a revenue of 60,000 crowns. In Europe, Mt. Athos alone has twenty, the inmates of which have so great a reputation for sanctity, that even the Turks seek an interest in their prayers. The C. are obliged to labor for the benefit of their monastery as long as they continue in it. Their religious services occupy an unnaturally large portion of their time, beginning at midnight and continuing at intervals until sunset. They observe four Lent: the first, of eight weeks, in commemoration of the resurrection of our Lord; the second, of three weeks, in honor of the holy apostles; the third, of fourteen days, in commemoration of the assumption of the Virgin; and the fourth, in commemoration of the advent.—There are also female C., or Greek nuns, who likewise follow the rule of St. Basil.

CAL'PE. See **HERCULES, PILLARS OF**, *ante*.

CALPEE, a city of Jhansi, one of the n.w. provinces of India, on the right bank of the Jumna, in lat. 26° 7' n., and long. 79° 48' east. Pop. '72, 15,570. It is an entrepôt for the cotton of the neighboring district. It has manufactures of cotton and paper, and is celebrated for the beauty of its refined sugar. It became British by capture and cession, respectively, in 1803 and 1806. It is 51 m. s.w. of Cawnpore, and is closely linked with it in the history of the insurrection of 1857-58, as the head-quarters of the Gwalior contingent.

CALPENTYN, a long and narrow peninsula on the w. side of Ceylon, in lat. 8° 14' n., and long. 79° 53' east. The neck is so low as to be overflowed during the n.e. monsoon, so that it is transformed into an island.

CALPURNIUS. The Calpurnia gens was, by its own account, one of the oldest plebeian clans in Rome; but it does not figure in history till the time of the first Punic war. The family names, in the time of the republic, were Bestia, Bibulus, Flamma, and Piso.—**MARCUS CALPURNIUS BIBULUS** is known as the hostile but incapable colleague of Cæsar (q.v.) in the consulate. He was put up by the aristocratic party, who spent vast sums to carry the election. He finally joined the Pompeian party, had command of the fleet intended to prevent Cæsar's passage to Greece, and died 48 B.C., before the battle of Dyrrhachium. Among the Roman women of this family, two are celebrated—**CALPURNIA**, the daughter of Calpurnius Piso (consul 58 B.C.), and the last wife of Cæsar, who seems, from the scanty notices of her we possess, to have been a quiet domestic woman, full of love and solicitude for her great husband; and **CALPURNIA**, the daughter of L. Calpurnius Bestia, wife of P. Antistius, who killed herself when her husband was murdered by order of the younger Marius, 82 B.C.

CALPURNIUS, TITUS JULIUS, surnamed **SICULUS**, a pastoral poet who lived in Sicily about the end of the 3d century. He seems to have been an imitator of Virgil, but beyond his complaining of poverty nothing is known of his personal history.

CALTABELLO'TA (a Saracenic name = "the castle of the cork-trees"), a t. of Sicily, Girgenti, 7 m. n.e. of Sciacca, most picturesquely situated around an ancient castle, which crowns a steep rock overhanging a stream (anc. *Crimisus*), of the same name as the town. Of its churches the *Chiesa Matrice* is a beautiful relic of the middle ages, resembling a mosque, with a single row of columns down the middle. C. was captured by the Saracens in 840 A.D. Pop. 6200.

CALTANISSETTA, a province in Sicily s. of Palermo; 1455 sq.m.; pop. '71, 230,066. The soil is fertile, producing grapes, olives, almonds, hemp, cotton, etc. Marble, agate, alabaster, sulphur, and iron ore are found. Agriculture is the chief industry, but there are foundries and manufactories of chemicals.

CALTANISSETTA, a fortified t. of Sicily, situated on a fertile plain near the Salso, about 28 m. n.e. of Girgenti. It has mineral springs and extensive sulphur-works. Pop. '72, 26,156.

CALTAVUTURO, a t. of Sicily, province of Palermo, and 37 m. s.e. of the city of that name, on a small river, the Grande. The town is of Saracenic origin. Jasper is found near C. Pop. 5000.

CAL'THA. See **MARSH MARIGOLD**.

CALTONICA, a t. of Sicily, about 15 m. n.w. of Girgenti. It has pretty extensive sulphur-works and salt-works. Pop. 7000.

CALTBOP, **CALTHROP**, or **CALTHORP**, in military warfare, is a four-pronged piece of iron, each prong about four in. in length. When it is wished to check the approach of

the enemy's cavalry over a plain, or of his besiegers in the ditch of a fortification, cal-trops are sometimes thrown down; from their shape, one prong is sure to stand upright, and may work terrible mischief to the enemy's horses or men.

CALUIRE, a t. of France, in the department of the Rhone, situated on the left bank of the Saone, about 3 m. n.n.e. of Lyon. It has three annual fairs. Pop. '76, 7207.

CALUMBA, or **COLOMBO**, very extensively used in medicine, is the root of *cocculus palmatus*, a herbaceous plant of the natural order *menispermaceæ* (q.v.). It is said to derive its name from Colombo in Ceylon, although the *C.* now chiefly in use is the produce of Mozambique. The flowers in this genus have 12 sepals and petals in all, similar in appearance, and disposed in four rows. The male and female flowers are on separate plants. *C. palmatus* has nearly circular leaves with 5 to 7 lobes, on long hairy foot-stalks, and solitary axillary racemes of small green flowers, the racemes of the male plants branching. The fruit is a drupe, or 1-seeded berry-like fruit, about the size of a hazel-nut, densely clothed with long hairs. The stem is annual and twining; the root perennial, consisting of clustered spindle-shaped fleshy tubers, with a brown warty epidermis, and internally deep yellow. The plant is not cultivated: the root is collected where it grows wild in dense forests. It is dug up in Mar., cut into slices or short cylindrical pieces, and dried in the shade. In this state it appears in commerce, having a greenish-yellow tint, a very bitter taste, and a faint aromatic odor. Its bitterness is ascribed to a somewhat narcotic principle called calumbine, and to *berberine*, an alkaloid originally discovered in the barberry (q.v.), which is also present in it. *C.* is regarded as one of the most useful stomachics and tonics. It is demulcent, not at all stimulant, and capable of being employed in cases in which almost every other tonic would be rejected by the stomach. It is sometimes given to allay vomiting. It has been found very useful in diarrhea and dysentery. It is administered in the form of powder, infusion, or tincture. Similar properties seem to reside in the roots of the species of *cocculus* generally.—The very poisonous seed known by the name of *cocculus Indicus* (q.v.), belongs to a plant of a different but allied genus.—The root of *frasera walteri* is sometimes fraudulently substituted for *C.*, and has been called American calumba root. It does not agree with *C.* in its properties, but, besides its very different appearance, it may be distinguished by its undergoing no such change of color when touched with tincture of iodine, as in true *C.* root is produced by the presence of starch. See **FRASERA**.

CALUMET, the "peace-pipe" of the North American Indians, is a tobacco-pipe having a stem of reed about two feet and a half long, decorated with locks of women's hair and feathers, and a large bowl of polished marble. It plays an important part in the conclusion of treaties, of which, indeed, it may be described as the ratifier. After a treaty has been signed, the Indians fill the *C.* with the best tobacco, and present it to the representatives of the party with whom they have been entering into alliance, themselves smoking out of it afterwards. The presentation of it to strangers is a mark of hospitality, and to refuse it would be considered an act of hostility.

CALUMET, a co. in e. Wisconsin, on Winnebago lake; 360 sq. m.; pop. '70, 12,335. It is a hilly region, but with abundance of timber and good pasturage, and produces grain, hay, hops, wool, etc. Co. seat, Chilton.

CALUMET, a t. and village in Houghton co., Mich., on the Mineral Range railroad; pop. of township '80, 8291. In the town is a copper-mine supposed to be the richest in the world; employing from 1800 to 2000 men and yielding annually 12,000 to 15,000 tons of pure copper. There are some manufactures in the village.

CALUMNY. An ancient regulation of the Scotch law obliged litigants to give their *oath of C.*—that is, they swore, either by themselves or by their counsel, that the facts alleged by them were true, although in practice this oath was not usually put unless one of the parties required it of his adversary. In the modern practice, however, of the court of session, this oath is confined to actions for divorce, and other consistorial cases—the object being to guard against collusion between the husband and wife. See **DIVORCE**.

CALUMNY, LAW AS TO. See **LIBEL**.

CALUSO, a t. of n. Italy, in Piedmont, province of Turin, about 11 m. s. of Ivrea, and connected with Turin by railway. Pop. 3500.

CALVADOS, a maritime department in the n.w. of France, bounded n. by the English channel, and e., w., and s. by the departments of Eure, Manche, and Orne. It is formed out of a part of the old province of Normandy. The principal rivers are the Touques, Orne, Dives, Seulle, Dromme, and Vire. The coast, which has few bays or inlets, is partly formed by bold ridges, and partly by sand-downs, cliffs, and reefs. The reef extending between the mouths of the Orne and the Vire, called Calvados, after one of the vessels in the Spanish armada shipwrecked here, and from which the department takes its name, is very dangerous to navigation. The soil of the department is generally fertile, especially in the valleys, supplying rich pasturage for horned cattle, sheep, horses, and swine, which constitute the principal wealth of Calvados. The climate is healthy, though changeable. Iron, marble, slate, and coal are found. There are various manufactures, and the coast-fisheries are of some importance. *C.* has an area of 2130

sq. m., with a pop. in 1876 of 450,220, and is divided into six arrondissements. Caen is the capital.

CALVAERT, DIONYS, called also DIONISIO FLAMMINGO, a distinguished painter, especially in landscape, was b. at Antwerp in 1555. He settled early at Bologna, where he opened a school, and had among his students the celebrated Domenichino, Guido, and Albani, who were, afterwards, however, pupils of the Caracci. Many excellent pictures by him are still preserved at Bologna. He died in 1619.

CALVARY, MOUNT, the scene of our Savior's crucifixion, is an eminence which lay at the n. w., and just on the outside, of the ancient city of Jerusalem. Calvary, or Calvaria, is a translation into Latin of the Hebrew word Golgotha, signifying a "skull," either because the mount was a place of public execution, or because it was shaped like a human skull.

CALVARY, in Roman Catholic countries, is a representation of the various scenes of the passion and crucifixion of our Lord, either in a chapel, or external to the church, as at St. Jacques at Antwerp. It consists of three crosses with the figures of Christ and the thieves, usually as large as life, surrounded by a number of figures, representing the various personages who took part in the crucifixion. At Aix-la-Chapelle, the C. is a church on the top of a hill, surrounded by twelve sculptured stones, each marking an event which took place on the journey of the Savior to Mount Calvary. The approach to the C. is called the *Via Dolorosa*, each of the stones marking what is called a station, at which the pious say a prayer in passing.

CALVELLO, a t. in the province of Basilicata, Italy, pleasantly situated on a hill-slope about 13 m. s. of Potenza. It has two convents. Pop. 5650.

CALVENTURA ISLANDS, off the coast of Arracan, in the bay of Bengal, their center being in lat. 16° 53' n., and long. 94° 20' east. The group consists of two divisions—one to the s. e., which is composed of two lofty and well-wooded islets; and another to the n. w., which presents seven bare rocks, chiefly of fantastic shapes.

CALVERT, a co. in Maryland, on Chesapeake bay; 250 sq. m.; pop. '70, 9865—5533 colored. Its surface is rolling, with good soil, having marl in abundance. The chief productions are tobacco, corn, and oats. Co. seat, Prince Frederick.

CALVERT, GEORGE and CECIL. See BALTIMORE, LORD.

CALVERT, GEORGE HENRY, b. Baltimore, 1803; a graduate of Harvard, and for a long time editor of the *Baltimore American*. In 1832, he published *Illustrations of Phrenology*, the first treatise on the subject issued in this country. Among his works are a *Metrical Version of Schiller's Don Carlos*; *Scenes and Thoughts in Europe*; *Cabiro*, a Don Juanic poem; *An Introduction to the Social Sciences*; *The Gentleman*; *Aynta and Other Poems*; *First Year in Europe*; *Ellen, a Poem*; and *Goethe, his Life and Works*. In 1843, he removed to Newport, R. I., of which city he was chosen mayor in 1853.

CALVERT, LEONARD, 1582—1647; brother of the second lord Baltimore, and first governor of Maryland. In 1663, he led the first expedition to Maryland in two small vessels, and on the 25th of Mar., 1634, at St. Clement's island on the Potomac, a regular mass was celebrated. Immediately afterwards they settled on the right bank of a river called by them St. George, and founded the prospective city of St. Mary, no signs of which now remain. After much difficulty with the people of Virginia the colonists under Calvert were fully established, and in 1647 his name as governor of the province was recognized.

CALVI, a seaport on the island of Corsica, situated on a peninsula in the gulf of Calvi, about 38 m. w. s. w. of Bastia, lat. 42° 35' n., long. 8° 43' east. It is strongly fortified, and has a good port, with a high light at its entrance, and a considerable export trade. C. was captured by the English in 1794, after a siege of 51 days. Pop. '72, 1969.

CALVILLE, a kind of apple, of which there are numerous sub-varieties. The calvilles diminish in thickness from the middle towards the calyx, where they form a point; they have regular ribs and a large open seed-chamber; also a pleasant smell, and are unctuous to the touch. They are never altogether streaked; they have a fine loose flesh, with a flavor somewhat resembling that of the raspberry or strawberry. The white winter C. is in high repute both as a culinary and dessert apple; it is very extensively cultivated on the continent of Europe.

CALVIN, JOHN, one of the most eminent of the reformers of the 16th c., was b. at Noyon, in Picardy, on the 10th of July, 1509. His father, Gerard Cauvin or Calvin, was procureur-fiscal of the district of Noyon, and secretary of the diocese. He was one of six children—four sons and two daughters. All the three sons who survived were bred ecclesiastics; and the reformer himself, while still only 12 years of age, was appointed to a chaplaincy in the cathedral church of Noyon. This he held as a means of support during the period of his education, and even for some short time after he had entered on his reforming career. C. was educated in circumstances of ease, and even affluence. The noble family of Mommor, in the neighborhood, invited him to share in the studies of their children; he was in some measure adopted by them; and when the family went to Paris, in his 14th year, he accompanied them, and participated in the benefits of the higher instruction which was there attainable. He was entered as a pupil in the collège

de la Marche, under the regency of Mathurin Cordier, better remembered, perhaps, by his Latin name of Corderius. It was under this distinguished master that C. laid the foundation of his own wonderful mastery of the Latin language. During this early period, he was distinguished by the great activity of his mental powers, and the grave severity of his manners. His companions, it is said, surnamed him the "Accusative."

For awhile, his attention was directed to the study of law. His remarkable talents seemed to promise great success in this branch of study, and his father sent him, with the view of prosecuting it, to the university of Orleans, then adorned by Pierre de l'Etoile, one of the most famous jurists of his day, and afterwards president of the parliament of Paris. At Orleans, he continued the same life of rigorous temperance and earnest studiousness for which he was already noted. Beza says that, after supping moderately, he would spend half the night in study, and devote the morning to meditation on what he had acquired. His undue habits of study seem to have laid thus early the foundation of the ill-health which marked his later years. It was while a law-student in Orleans that he became acquainted with the Scriptures, and received his first impulse to the theological studies which have made his name so distinguished. A relative of his own, Pierre Robert Olivetan, was there engaged in a translation of the Scriptures; and this had the effect of drawing C.'s attention, and awakening within him the religious instinct which was soon to prove the master-principle of his life. We cannot say as yet that his traditional opinions were unfixed, or that he had embraced with any decision the Protestant opinions that were spreading everywhere; but the seeds of the new faith were now beyond doubt sown in his heart, and from this time, although he still continued for awhile longer to pursue his legal studies, his main interests appear to have been religious and theological. From Orleans he went to Bourges, where he acquired the knowledge of Greek, under the tuition of a learned German, Melchior Wolmar, to the influence of whose spiritual instructions he was also greatly indebted. He began here to preach the reformed doctrines, and passed over into the ranks of Protestantism, under the slow but sure growth of his new convictions, rather than under the agitation of any violent feeling. Here, as everywhere, his life presents a marked contrast to that of Luther.

He proceeded to Paris in 1533, which at this date had become a center of the "new learning," under the teaching of Lefevre and Farel, and the influence of the queen of Navarre, sister of Francis I. The Sorbonne itself had not escaped the infection. There was a growing religious excitement in the university, in the court, and even among the bishops. This, however, was not to last. The king was soon stirred up to take active measures to quell this rising spirit; and the result was that C. and others were obliged to flee for their lives. The story is that C. narrowly escaped, having descended from his window by means of his sheets, and fled, under the guise of a vine-dresser, a friend of his, in whose clothes he concealed himself. After this he repaired for a short time to his native place, resigned the preferment he held in the Roman Catholic church, and for a year or two led a wandering life, sheltered in various places. We find him at Saintonge; at Nerac, the residence of the queen of Navarre; at Angoulême, with his friend Louis Tillet; then for a brief while at Paris again, strangely enough expecting a meeting with Servetus, who had expressed a desire to see and confer with him. Persecution against the Protestants at this time raged so hotly, that C. was no longer safe in France; and he betook himself to Basel, where he is supposed to have prepared the first edition of the *Institutes of the Christian Religion*, and whence he certainly issued, in the year 1535, the famous preface addressed to Francis I. The concentrated vigor of this address, its intensity of feeling, rising into indignant remonstrance, and at times a pathetic and powerful eloquence, make it one of the most memorable documents in connection with the reformation. It is throughout a noble defense of the righteous character of the reformed doctrines, and their support alike in Scripture and in history. The energetic decisiveness and moral zeal of the future teacher and legislator of Geneva, speak in every page of it. After completing this great service to the cause of Protestantism, he made a short visit to Italy, to Renée, the duchess of Ferrara. Finally, he revisited his native town; sold the paternal estate, which had devolved to him on the death of his eldest brother; and bidding it adieu, set out in company with his younger brother and sister on his way to Strasburg. The direct road being rendered dangerous by the armies of Charles V., which had penetrated into France, he sought a circuitous route through Savoy and Geneva.

The result of this journey was memorable for the cause of the reformation. Arrived in Geneva, he met there his friend, Louis Tillet, who communicated the fact of his arrival to Farel, then in the very midst of his struggle to promote the reformation in the city and neighborhood. Farel hastened to see him, and urge upon him the duty of remaining where he was, and undertaking his share of the work of God, under the burden of which he was like to fail. C. did not at first respond to the call. He was given, he himself says, to his "own intense thoughts and private studies." He wished to devote himself to the service of the reformed churches generally, rather than to the care of any particular church. A life of intellectual and theological labor was that which at that time was most congenial to him. By some strange insight, however, Farel penetrated to the higher fitness of the young stranger who stood before him, and he ventured, in the spirit of that daring enthusiasm which characterized him, to lay the curse of God

upon him and his studies if he refused his aid to the church of Geneva in her time of need. This seemed to C. a divine menace. "It was," he said, "as if God had seized me by his awful hand from heaven." He abandoned his intention of pursuing his journey, and joined eagerly with Farel in the work of reformation.

Such was the beginning of C.'s great career in Geneva. Having entered upon his task, he soon infused an energy into it which crowned the struggling efforts of Farel with success. The hierarchical authority was already overturned before his arrival; the citizens had asserted their independence against the duke of Savoy, whose alliance with the corrupt episcopate, which was the direct governing influence in the place had called forth the patriotic as well as the religious feelings of the people. The magistrates and people eagerly joined with the reformers in the first heat of their freedom and zeal. A Protestant confession of faith was drawn out, approved of by the council of two hundred, the largest governing board of the city, and then proclaimed in the cathedral church of St. Peter's as binding upon the whole body of the citizens. Great and marvelous changes were wrought in a short time upon the manners of the people; where license and frivolity had reigned, a strict moral severity began to characterize the whole aspect of society. The strain, however, was too sudden and too extreme. A spirit of rebellion to the rule of C. and Farel broke forth; they refused to yield to the wishes of a party animated by a more easy and liberal spirit than themselves, and known in the history of Geneva under the nickname of Libertines; and the consequence was, that they were both expelled from the city after less than two years' residence.

C. retreated to Strasburg, where he had meant to go when arrested in his course at Geneva. Here he settled, and devoted himself to theological study, and especially to his critical labors on the New Testament. Here, also, in Oct., 1539, he married the widow of a converted Anabaptist. The marriage appears to have proved a happy one, although not of long duration.

The Genevans found, after a short time, that they could not well get on without Calvin. His rule might be rigid; but an authority, even such as his, which might gall from its severity, was better than no settled authority at all; and the libertine party seem to have been unable to construct any efficient and beneficent form of government. Accordingly, they invited C. to return; and after some delay on his part, in order to test the spirit in which they were acting, he acceded to their invitation, and in the autumn of 1541, after three years' absence, once more made his entry into Geneva.

Now, at length, he succeeded in establishing his plan of church-government, in all its forms and details. By his college of pastors and doctors, and his consistorial court of discipline, he founded a theocracy, with himself at the head of it, which aimed virtually to direct all the affairs of the city, and to control and modify both the social and individual life of the citizens. Not without a struggle, it may be supposed, did he succeed in his great autocratic scheme. The libertines, although dishonored by their ineffectual attempts to maintain order in the city, and uphold its rights and dignity, still remained a strong party, which was even augmented, after C.'s return, by men such as Amy Perrin, who had strongly concurred in the invitation to C., but who were afterwards alienated from him by the high and arbitrary hand with which he pursued his designs, as well as by their own schemes of ambition. The struggle with this party lasted with various fortune for no less a period than 15 years, and was only terminated in 1555, after a somewhat ridiculous *émeute* in the streets. Amy Perrin and others, driven from the city, were executed in effigy; and the reformer's authority from this date confirmed into an absolute supremacy.

During the period of this long struggle with the libertines, C. had many other disputes, in which he conducted himself with no less heartiness and zeal. The most remarkable of these were his controversies with Sebastian Castellio, Jerome Bolsec, and above all, Michael Servetus.

C. had become acquainted with Castellio at Strasburg. They entertained at first a warm friendship for each other, and C. showed great zeal in assisting Castellio, whose poverty and learning had attracted his sympathy. When he returned to Geneva, he invited Castellio to join him there, and procured for him the title of regent or tutor in the gymnasium of the city. There was little similarity, however, in the characters of the two men, and the diversity of their tastes and views soon became apparent. The learning of Castellio was intensely humanitic; a classical spirit and a somewhat arbitrary opinionativeness molded all his studies; and as soon as he began to apply himself to theology, he came into conflict with Calvin. In a letter to Farel in 1542, we find C. speaking of the freaks of "our friend Sebastian, which may both raise your bile and your laughter at the same time." These freaks relate to Castellio's notions of scriptural translation, and his refusal of C.'s offer to revise the version which he had made of certain parts of Scripture. Then, two years later, when Castellio desired to enter into the ministry, C. dissuaded the council from accepting him, on account of some peculiar opinions which he held. These were certain rationalistic views as to the authenticity and character of the Song of Solomon, the descent of Christ into hell, and also about election. After this, Castellio left Geneva for awhile, but soon returning, he attacked the views of C. openly. After a violent scene in church, which is painted in C.'s letters very strongly, he was forced to leave the city. The two old friends, now declared enemies, did not spare each other henceforth. The fate of Servetus drew forth an anonymous publication, attacking

with keen logic and covert and ingenious sarcasm the Genevan doctrines. This publication was attributed by both C. and Beza to Castellio, and they replied to him in no measured terms, stigmatizing him as a "deceiver and vessel of Satan." One fact really disgraceful to C. in the controversy deserves not to be passed over. Sunk in great poverty, Castellio was obliged, in his old age, to gather sticks on the banks of the Rhine at Basel, as a means of support. C. did not hesitate to accuse him of stealing the sticks. Such polemical truculence may well make us turn away in disgust and indignation.

The controversy with Bolsee belongs to a later period. Jerome Bolsee was originally a Carmelite monk, but he had thrown aside the habit, and betaken himself to the practice of medicine in Geneva. He was led to attack C.'s doctrine of predestination. As soon as C. heard of this, he led him to understand that he was not at liberty to question the Genevan doctrine. He and the other clergy dealt with him; but after repeated disputations Bolsee was found incorrigible, and was sentenced to banishment from the city. Cast out of the theocratic community, he ultimately re-joined the Roman Catholic church, and revenged himself in a somewhat mean way against C. by writing his life in a spirit of detraction and slander.

Of all these contests, however, the most memorable is that with Servetus. A melancholy interest encircles the name of this great heretic, which the criminal tragedy of his death keeps always fresh and vivid in the minds of all who hate intolerance, and who love truth rather than dogmatism. The character of Servetus himself has little to do with this interest. He seems to have been more of a vain, restless, and enthusiastic dreamer, than of a calm and patient inquirer. In his very dreams, however, and the vague audacities of his speculation, there is a kind of simplicity and unconscious earnestness that wins sympathy. He had entered into various connections with C., even from the time of his early residence in Paris; particularly, he had sent him various documents containing the views, fully developed in his work subsequently published under the title of *Restitutio Christianismi*. C. never concealed his abhorrence of these views; and in a letter to Farel as early as 1546, he threatens that if Servetus should come to Geneva, he would do what he could to bring him to condign punishment: *Nam si venerit, modo valeat mea autoritas, vivum exire nunquam patiar*. The history of his seizure and condemnation at Vienne by the Catholic authorities, and especially of C.'s share in the correspondence which led to his seizure, is very complicated and obscure. It has been maintained that C. was the instigator, through a creature of his own of the name of Trie, of the whole transaction; it is certain that he forwarded to the authorities, through Trie, private documents which Servetus had intrusted to him, with a view to the heretic's identification, and as materials for his condemnation. Servetus was sentenced to be burned, but effected his escape, and, after several months' wandering, he was found at Geneva. It was his intention to proceed to Italy, where he hoped his opinions might meet with some degree of toleration, and he arrived at Geneva on his way. This is the explanation of an event otherwise unaccountable. Having ventured to church, according to the common account, he was recognized, apprehended, and conveyed to prison by C.'s order, just as he was about to leave the city. The particulars of his trial are full of interest, but too lengthened to be detailed here. It lasted, with various interruptions, for two months. He attacked C. with the most foul epithets, and C. retorted with a virulence and foulness quite equal to his own. At length, on the 26th of Oct., 1553, sentence was passed upon Servetus, condemning him to death by fire. C. used his influence to have the mode of death alleviated, but without success. On the very next morning, the sentence was put into execution. On an extended eminence at some distance from the city, Servetus was fastened to a stake surrounded by heaps of oak-wood and leaves, with his condemned book and the MS. he had sent to C. attached to his girdle; and, amid his agonizing cries, the fire was kindled, and the wretched man expiated his heresy amidst the flames. Whatever apologies may be urged for this memorable crime, it must remain a mournful and scandalous blot on the history of the reformation. The disgrace of it has particularly attached to C., and with some justice, from the special and unhappy relation which he bore to the whole transaction; but most of the reformers are no less implicated in it. The wise Bullinger defended it, and even the gentle Melancthon could only see cause for gratitude in the hideous tragedy.

After the execution of Servetus, and the expulsion of the Libertines, two years later, C.'s power in Geneva was firmly established, and he used it vigorously and beneficently for the defense of Protestantism throughout Europe. By the mediation of Beza, he made his influence felt in France in the great struggle that was there going on between the hierarchical party, with the Guises at its head, and the Protestants, led by Condé and Coligny. In 1561, his energies began to fail. He had been long suffering from bad health, but his strength of will and buoyancy of intellect sustained him amid all his bodily weakness. In the year now mentioned, his bad health greatly increased, and although he survived for more than two years, he never regained any vigor. He died on the 27th of May, 1564.

Very different estimates, it may be imagined, have been formed of C.'s character, according to the point of view from which it is contemplated. None, however, can dispute his intellectual greatness, or the powerful services which he rendered to the cause of Protestantism. Stern in spirit, and unyielding in will, he is never selfish or

petty in his motives. Nowhere amiable, he is everywhere strong. Arbitrary and cruel when it suits him, he is yet heroic in his aims, and beneficent in the scope of his ambition. Earnest from the first, looking upon life as a serious reality, his moral purpose is always clear and definite—to live a life of duty, to shape circumstances to such divine ends as he apprehended, and, in whatever sphere he might be placed, to work out the glory of God.

He rendered a double service to Protestantism, which, apart from anything else, would have made his name illustrious: he *systematized its doctrine*, and he *organized its ecclesiastical discipline*. He was at once the great theologian of the reformation, and the founder of a new church polity, which did more than all other influences together to consolidate the scattered forces of the reformation, and give them an enduring strength. As a religious teacher, as a social legislator, and as a writer, especially of the French language, then in process of formation, his fame is second to none in his age, and must always conspicuously adorn the history of civilization. Among C.'s most important works are: *Christianæ Religionis Institutio* (Basel, 1536); *De Necessitate Reformandæ Ecclesiæ* (1544); *Commentaires sur la Concordance ou Harmonie des Évangélistes* (Gen. 1561); *In Novum Testamentum Commentarii*; *In Libros Psalmorum Commentarii*; *In Librum Genesios Commentarii*. The first edition of C.'s whole works is that of Amsterdam, 1671, in 9 vols. fol. A complete critical edition by Baum, Cunitz, and Reuss began to appear at Brunswick in 1869. By the "Calvin translation society," in Edinburgh, his works have been collected, translated into English, and issued in 51 vols. 8vo, 1843-55. Besides the original *Fita* by Beza, there are lives of C. by Bolsec (from the Catholic standpoint, 1577; new ed. 1875), Audin (1840), Bungener, Viguier and Tissot (1864); and in Germany, by Henry (1844), Stähelin (1863), and Kampshulte (vol. i. 1869).

CALVINISM is the system of religious doctrine associated with the name of Calvin, and supposed to distinguish the churches more particularly called the reformed, in contradistinction to the Lutheran and Anglican churches. Calvin's doctrinal views are laid down at length in his *Institutio Christianæ Religionis*, first published in 1536. It was not till many years later, however, that the name of C. came to be attached to a certain set of doctrinal opinions, and not till the rise of Arminius (q.v.) and the synod of Dort (q.v.) in 1618, that these opinions may be said to have been polemically marked off from others with which they are generally contrasted, and to which they are recognized as standing in opposition.

The difference of thought expressed in the Arminian and Calvinistic systems is as old as the history of Christian doctrine. In almost every point, Augustine may be said to have anticipated Calvin; while Pelagius and the eastern divines, such as Chrysostom, represented a type of opinion upon the whole consonant to that which in more modern times has been opposed to Calvinism. In the Roman Catholic church, since the reformation, the same opposition of thought has presented itself in the famous contest of Jansenism and Jesuitism.

The main point of distinction in the two systems or modes of Christian opinion, is as to the operation of divine grace in the salvation of sinners. In the one system, this operation is considered as predetermined and absolute; in the other, as merely prescient, and in some sense conditioned. *Predestination* and *irresistible grace* are the great key-notes of C.—its two main points. Others were added in opposition to Arminianism—viz., *original Sin*, *particular redemption*, and the *perseverance of the saints*; but the first of these is not peculiarly Calvinistic, and the last two are merely corollaries from the doctrines of predestination and grace. Predestination is, in fact, the one distinguishing doctrine of the system, as it was of Augustinianism, of which C. was merely the revival. The divine will, apprehended as decreative and predestinating, is necessarily *irresistible* in its efficacy, *select* in its objects, and *persevering* in its results. The characteristic of C., therefore, is that it is a speculative Christian system, springing from a single great principle, carried out rigorously into all its logical consequences.

The church of England, in its earlier history, was Calvinistic in its creed, although mediæval and Catholic in its ritual. Puritanism was nothing else than a movement to reduce it altogether to a Calvinistic model. In the reaction which followed this movement, the church of England, while retaining its original articles, nearly parted with its Calvinistic faith; and throughout the 18th c., its chief divines are conspicuously Arminian or latitudinarian. But with the revival of the evangelical party in the end of the century, C. revived; and it still maintains, if not an absolute sway, yet a powerful influence over many minds in the Anglican establishment, while it is the professed creed of a great proportion of the dissenters.

The church of Scotland, along with the other Presbyterian churches in this country, and the large and numerous increasing bodies of Presbyterians in America, all hold to the Westminster confession of faith, the most elaborate and formal expression of Calvinistic doctrine that exists. But while holding to the same Calvinistic standard, these churches show many varieties of actual opinion; and in the history of Presbyterianism, C. has shown a tendency in its logical development to pass into rationalism or Unitarianism. This is conspicuously the case in the church of Geneva itself, and some of the old Puritan churches of America. It still remains, however, as opposed to Arminian, Socinian, or any cognate forms of the same type of doctrine, the most living and powerful among the creeds of the reformation.

CALVINISTIC METHODISTS, in Great Britain, are in three divisions: the Whitfield Connection, 1741; Lady Huntingdon Connection, 1748; and Welsh Methodists, 1750.

CALVISIUS, SERIUS, 1556-1617; an astronomer and chronologist of Germany, who organized a system of chronology embodying the history of the world. The work was commended by Scaliger and Casaubon, but was condemned in the *Index Expurgatorius*. In 1612, he published a work on the Gregorian calendar, undertaking to show the inadequacy of that system and to supplant it with one founded upon astronomical principles.

CALW, or **KALW**, an important manufacturing t. in Württemberg, chief seat of the Württemberg timber-trade with Holland, and capital of a bailiwick of the same name, in the circle of the Black forest, lies in the valley of the Nagold, on both sides of the stream, over which are two stone bridges. Cotton and woolen spinning, dyeing turkey-red, manufacturing woolen and cotton fabrics, making leather, stout shoes, cigars, etc., are the principal industries. Though the streets in the old town are irregularly built, there are many large and beautiful houses. Pop. '71, 5582; '75, 4642; nearly all Protestants.

CALX is the Latin term for quicklime. As quicklime is produced by burning limestone, the alchemists applied the term C. to the product obtained by burning any ore or other mineral substance; and *calcination* (q. v.) to the process.

CALYCANTHUS (Gr. calyx-flower), a genus of plants of the natural order *calycanthaceæ*, an order allied to *rosaceæ*, and of which only a few species are known, natives of North America and Japan—shrubs, with square stems, which are of remarkable structure, having around the central woody axis four smaller imperfect ones. An aromatic fragrance characterizes this order. In the genus C., the bark and leaves possess it as well as the flowers. The bark of *C. floridus*, a native of Carolina, has been used as a spice and carminative, and has acquired the name of Carolina allspice, or American allspice. The flowers are of a chocolate color.

CALYDON, an ancient city of Ætolia, $7\frac{1}{2}$ m. from the sea on the river Evenus, said to have been founded by Calydon, son of Ætolicus, to have been the scene of the hunting of the Calydonian boar by Meleager and other heroes, and to have sent soldiers to the Trojan war. In 391 B. C., it was in possession of the Achæans, and so late as the time of Pompey, it was a place of importance. In 31 B. C., Augustus removed the inhabitants to Nicopolis, a city then founded to commemorate the victory of Actium.

CALYDONIAN BOAR. Once upon a time, according to a Greek myth, a certain Æneus, king of Calydon, the ancient capital of Ætolia, omitted a sacrifice to Diana, whereupon the goddess, in her rage, sent into his fields a frightful boar, which committed great devastation. No one had the courage to hunt it except Meleager, the son of Æneus, who, calling to his help the bravest heroes of Greece—Theseus, Jason, Nestor, and others—pursued and slew the monster. Later writers, however, affirm that he found it impossible to destroy the animal, until Atalanta, his mistress, aided him by piercing it with an arrow.

CALYMENE, a genus of the fossil order trilobites (q. v.). It differed from the other genera of the order in the individuals having the power of rolling themselves into a ball, so that they are often found coiled up like an oniscus, i. e., hog-louse—*vulgo*, a slater. The genus is characteristic of the Silurian formation. The species we figure has been long known as the "Dudley locust." It is remarkable as a very long-substisting species, passing from the Caradoc beds to the Ludlow rocks. Twenty species have been described.

CALYPSO, in Grecian legend, was, according to Homer, the daughter of Atlas, and inhabited the solitary wooded isle of Ogygia, far apart from all gods and men. Ulysses being thrown upon her island by shipwreck, she treated him kindly, and promised him immortality if he would marry her. He was fascinated by her charms, but unwilling to desert his wife and his native land; she detained him, however, seven years, and bore him two sons. On his departure, she died of grief.

CALYPSO BOREALIS, an orchid with heart-shaped leaf, and beautiful yellow, pink, and purple flowers; growing in the bogs and moist woodlands of the United States and Canada.

CALYPTRÆA (Gr. *kalyptra*, a head-dress), a genus of gasteropodous mollusks, of the order *patinibranchiata*, the type of a family, *kalyptræidæ*, formerly included in the genus *patella*, or limpet, when the mere form of the shell was more regarded in classification than the structure of the animal, and still known as chambered limpets, cup-and-saucer limpets, bonnet limpets, and slipper limpets. The shell is limpet-shaped, but the apex is more or less spiral, and has a calcareous process from its inner surface for the attachment of a principal muscle. The *kalyptræidæ* differ much in shape, some being very flat, and others very conical; some elongated and slipper-like. The species are generally natives of the shores of warm climates. Only two are British.—*Kalyptræidæ* are common in the older fossiliferous rocks.

CALYX (a term originally Greek), in botany, the outermost of the circles of modified leaves which surround the parts of fructification, and along with them constitute the flower. Within the C. there is generally at least a second circle of leaves, called the corolla (see **COROLLA** and **FLOWER**); but this is sometimes wanting, and the C. is

the only envelope of the parts of fructification. The leaves of which the C. is composed are called *sepals*, when quite separate from each other; but they often grow together into a tube at the base, and the C. is then said to be *monosepalous* or *gamosepalous* (*monos*, one; *ganos*, union). The sepals are generally simple and without stalks; they are generally green, and differ much less widely from ordinary leaves than the petals or leaves of the corolla; sometimes, however, they are *petaloid*, and brightly colored, as in *fuchsia*. The C. and corolla of many endogenous plants resemble one another almost completely, and the common term *perianth* (q.v.) is then very generally employed. In some plants, the C. passes insensibly into the corolla, and it is not easy to distinguish the innermost sepals from the outermost petals. The C. is in such cases often composed of more circles of leaves than one. The C. occasionally falls off when flowering is over (*deciduous*), as in *ranunculus*; sometimes even when it commences (*caducous*), as in the poppy; generally it remains till the fruit is ripe (*persistent*), and is then much enlarged and more brightly colored, as in *physalis*. It often becomes fleshy, and forms the seeming fruit, as in the rose.—The glumes (q.v.) of grasses, etc., used to be regarded as a C., to which, however, they have no proper analogy.

CAM, or **GRANTA**, a river of England, which, rising in Essex, flows n.e. through Cambridgeshire, and after a course of about 40 m., joins the Ouse $3\frac{1}{2}$ m. above Ely. It gives its name to the town of Cambridge, which stands upon it, and below which it is navigable, and is classic on account of the boat-races on it by Cambridge students.

CAM, in machinery, a curved plate or groove, by which motion is communicated and controlled. The moving plate or groove is a *driver*; the rod, bar, or other thing moved, is called the *follower*. The follower is held against the driver by its weight or by a spring, or other device. The radii of the driver determine by their length the motion of the follower, and the angles which they make with some one, chosen as a base of calculation, fix the time at which change of motion occurs. For example, it may be desired that the follower shall move upward, and then downward, with a uniform velocity. From the center of the driver any convenient number of radii may be drawn, dividing equally the 360° of angular space. On one of these radii we mark the distance from the center of the driver at which the point of the follower will stand when in its position nearest to that center. Upon the opposite radius, distant 180° from the first, the point is marked which gives the farthest position of the follower; the difference between these radii being divided into as many equal parts as we have made angular spaces in the 180° , we increase the length of each radius in succession, beginning with the shortest, by one of those parts, and we draw a curve connecting the ends of the radii so terminated. Of course the greater the number of parts chosen for the division of the angular space and of the difference of the first and last radii, the more accurately will the curve be drawn. The edge of the driving-plate being cut to this curve, the follower being made to press constantly against it, and the driver being turned with a uniform rotation, the follower will move through its limited space with an equable motion, because the radii of the driver increase by constant amounts, at constant intervals of time. If the curve is reversed, the second part being the symmetrical opposite of the first part, the follower will descend as uniformly as it rose. The cam thus drawn is one of frequent use, and is called the *heart-shaped cam*. To avoid friction the end of the follower often carries a roller which works against the surface of the cam; in this case the cam-surface is found by drawing a line parallel to that above described, at a constant distance equal to the radius of the roller. If we wish the follower to rest at any part of a cycle of motion, the radii for that time will be made equal, and the corresponding cam-surface will be a circular arc; the time will be such a part of that of a complete cycle, as the angle between the radii of the ends of this arc, is of 360° . The cam-plate has sometimes a groove cut upon its flat side, and the end of the follower runs in the groove. A spiral groove may be cut into the surface of a cylinder as in a screw; if a follower be inserted in this groove it will be driven forward as the cylinder turns; when the groove reaches the end of the cylinder, it may turn back, and cause the follower to return with the same motion, or if the pitch of the groove be made shorter or longer, the return of the follower will be changed accordingly. By a judicious construction and arrangement of cams, almost every variety of motion may be produced with the greatest precision as to time and amount. A cam-form which does not make a complete revolution, but after moving a short distance in one direction oscillates in the opposite direction, is called a *wiper*. A familiar example may be seen in the engine-room of a steamboat, in the rocking arms which raise and let fall the valve rods.

CAM, **Diogo**, a Portuguese navigator of the 15th c., who continued the w. African discoveries commenced by Don Henry. He had sufficient influence with the king of Congo to induce that monarch to permit the establishment of Christianity in his dominion.

CAMALDOLITES, a religious order founded in the vale of Camaldoli, near Arezzo, in the Apennines, in 1018, by St. Romauld, a Benedictine monk, and a member of the noble family of the dukes of Ravenna. From Italy it spread into France, Germany, and Poland. The brethren, who wear a white garment, are, and have always been, characterized for the excessive rigidity of their monastic rule; but except to show to

what lengths in a cruel mortification of natural life man can proceed, they have been practically useless in the world. The order is now almost extinct.

CAMARGUE. See BOUCHES DU RHONE.

CAMARILLA, a Spanish word, diminutive of *camara*, literally signifies a little chamber. As *camara* is used to designate, *par excellence*, the chamber of the king of Spain, the royal chamber, so C. is also used to designate his private chamber or cabinet, the place where he receives his most intimate friends, courtiers, sycophants, and all the moral refuse that naturally gathers round a weak throne. Hence, in the political language of modern Europe, it has come to signify the influence exercised on the state by secret and unaccredited councilors, in opposition to the opinions of the legitimate ministry, an influence which in Spain particularly is most pernicious. The word first obtained this meaning in the time of Ferdinand VII., who was excessively addicted to the unkingly habit of listening to the insinuations of the companions of his pleasures.

CAMARINA, an ancient city of Sicily, near the mouth of the Hipparus, 20 m. e. of Terranova. It was founded by Syracusans in the 6th c. B. C., but soon after was destroyed, because it had thrown off its allegiance. It was restored 495 B. C., but again depopulated, being finally established about 34 years later. In 285 B. C., most of its people were sold by the Roman consuls as slaves. It continued to exist until the 2d c., but since then has been in ruins.

CAMAYEU and **MONOCHROME** are terms by which painting in one color is designated. The ancients painted thus both in gray (*en grisaille*) and in red. Pictures of several tints, but where the natural colors of the objects are not copied, are said to be *en camayeu*. As one color generally prevails, we speak of blue, red, yellow, green camayeu. Polidori Caravaggio, for example, so overlaid his other colors with brown, that his works give the impression of monochrome paintings. Drawings in Indian ink, red and black chalk, pencil, etc., as well as engravings, may be said to be *en camayeu*.

CAMBACÉRÉS, JEAN JACQUES RÉGIS, Duke of Parma, and high chancellor of the French empire, under Napoleon, was b. at Montpellier, Oct., 18, 1753. In 1791, he was appointed president of the criminal court in his native place. Afterwards, as member of the national convention, he took a prominent part in sketching the new code of laws, and distinguished himself by his moderation. He denied the right of the convention to condemn the king, and, when this was done, argued in favor of a reprieve. After the revolution of the 9th Thermidor (July 27, 1794), C. was elected president of the convention, and, as head of the committee of public safety, was active in procuring peace with Prussia and Spain. His enemies having succeeded in expelling him from office, he engaged himself in legal studies, and laid before the council of five hundred the sketch of a civil code which afterwards formed the basis of the *Code Napoleon*. In 1796, C. was for a short time made president of this council. After the changes made in the directory, he was made minister of justice, assisted in the revolution of the 18th Brumaire (Nov. 9, 1799), was made second consul, and faithfully attached himself to the interest of Napoleon, by whom he was raised to the office of high chancellor of the empire, and in 1808 was made duke of Parma. He endeavored to dissuade Napoleon from the projected invasion of Russia, but in this instance his advice was vainly given. In 1813, when Napoleon took the field against the allies, C. was left as president of the regency, and in this capacity accompanied the empress to Blois, 1814. From this place he sent to Paris his vote for the abdication of Napoleon. During the hundred days, against his own will, he was made minister of justice, and president of the chamber of peers. After the second restoration, C. lived privately in Paris for some time; but in 1816 was exiled for having taken part in the execution of Louis XVI. In 1818, his civil and political rights were restored, and he returned to Paris, where he lived retired to the time of his death, Mar. 5, 1824. Among the men of the revolution, C. was one of the few whose activity was peaceable and truly progressive. His services in the establishment of law were great. His nature was mild and candid, and his intellect very acute.

CAMBALUC, or **CAMBALU'** (Mongol, *Kaan-Baligh*, "city of the Khan"), the city now known as Peking. It was captured in 1215 by Genghis Khan, and in 1264 adopted as the imperial residence by his grandson Kublai, who founded a new city near the old one of Yenking. The new city, Ta-tu, or "great capital," was a rectangle about $5\frac{1}{2}$ by $3\frac{1}{4}$ m., or more than 18 m. in circumference, surrounded by a colossal wall of mud, having an inner inclosure for the palace and gardens of the khan. There were 11 gates, and the streets ran towards them in direct lines. It was the residence of the Mongol emperors until the fall of their power in 1368. Soon afterwards the native dynasty gave it the name of Pe-king, or "north court," by which name it was known to the early Jesuit missionaries; but now the native name in ordinary use is King-Cheng or King-tu, signifying "the capital." The restoration of Cambaluc was commenced in 1409; the size was diminished, and the town made more nearly a square, and in this form now constitutes the "Tartar city" of Pe-king. The walls were finished in 437. In 1544, the "outer city" was formed, the portion now known as "the Chinese city." The whole city under the name Cambaluc was made an archiepiscopal see by pope Clement V. in 1307.

CAMBAY, a city, district, and gulf at the n.w. extremity of the peninsula of Hindustan.—1. C., the city, stands at the head of its gulf, and on the right bank of the Myhee, in lat. $22^{\circ} 18'$ n., and long. $72^{\circ} 39'$ e., being 76 m. to the n.w. of Surat. It contains about 33,700 inhabitants, having been at one time much more populous—ruinous palaces, mosques, and tombs, and an excavated temple of considerable pretensions, attest its former magnificence and extent. The main cause of its decay has been the gradual obstruction of its seaward navigation. It still exports grain, cotton, and ivory, besides its renowned manufactures in bloodstone and carnelian.—2. C., the district, contains an area of 350 sq. m., stretching in n. lat. from $22^{\circ} 9'$ to $22^{\circ} 41'$, and in e. long. from $72^{\circ} 20'$ to $73^{\circ} 5'$. It is attached to the presidency of Bombay, though under the government of a nawab of its own. Pop. 85,000.—3. C., the gulf, extends in n. lat. between 21° and $22^{\circ} 10'$, and in e. long. between $71^{\circ} 50'$ and $72^{\circ} 40'$, measuring 80 m. in length, and averaging 25 m. in breadth. In proportion to its size, it receives a vast quantity of fresh water—on the w., the Gooma, Oolowtee, Gelya, and Setroonjee; on the n., the Saburnuttee and Myhee; and on the e., the Nerbulda and the Taptee. The inundations of so many rivers, and the ebb and flow of tides, which fall and rise 30 ft., conspire not only to elevate the bottom, but also to generate movable quicksands.

CAMBER, in ship-building, implies a slight arching or convexity upwards. A "cambered" ship is one in which the floor is higher in midships than at the stem and stern.—The name "camber" is also given to a small dock in a dockyard, for containing boats, and for loading and unloading timber.

CAMBERT, ROBERT, 1628–77; the first composer of French operas; organist of the church of St. Honore, and musical superintendent to Anne of Austria, the mother of Louis XIV. When Lulli was made musical superintendent to the king, in 1673, C. went to London, where Charles II. made him master of the band. His chief works were *Ariadne, or the Amours of Bacchus; Pomona; and The Pains and Pleasures of Love*.

CAMBERWELL, once a rural village, now a suburb of London, on the s. side of the Thames.

CAMBERWELL BEAUTY, *Vanessa antiopa*, one of the largest and most beautiful British butterflies, rare in Britain, although it has been found in many parts of the country, but common in the central and southern parts of Europe. The wings are of a deep brown color, with a band of black around the brown, and an outer band or margin of pale yellow, the black band containing a row of large blue spots, the yellow margin dappled with black specks, all the colors rich and velvety. The margin of the wings exhibits tooth-like angularities. The antennæ are terminated by a knob. The caterpillar feeds on the willow. It is black, with white dots and a row of large red spots down the back, and is rough with soft spines.—When Camberwell was more rural than now, and abounded in willows, this butterfly was sometimes taken there.

CAMBIO—CAMBIST. The former of these two words is the Italian for *exchange*; the latter, for a *money-changer*. Cambist is also used figuratively as the title of a book in which the moneys, weights, measures, etc., of various nations are given in the equivalents of some particular one. For instance, Kelly's *Universal Cambist* gives these in English, and the *Cambista Maltesa* in Italian.

CAMBIUM (Lat. *ambio*, to change), in botany, a layer of mucilaginous viscid matter, particularly abundant in spring, interposed between the woody layers and the bark of trees and other stems. Delicate cells (*cambium cells*) are formed in it, which certainly fulfill important functions in the formation of new wood, although, notwithstanding much investigation by some of the greatest vegetable physiologists of our time, the nature of these functions is still very imperfectly ascertained. The medullary rays are connected with the C. cells, and these cells gradually elongate into the shape which belongs to those of woody tissue. The C. layer is found only in exogenous stems.

CAMBODIA, or CAMBOJA (native name, *Kan-pou-chi*), an extensive country of the Indo-Chinese peninsula, now a protectorate of France, bounded on the s.w. by the gulf of Siam, on the s.e. by French Cochinchina, and on the n. by Siam. Area about 33,000 sq. m.; pop. about 900,000. The surface is mostly flat, and the soil fertile. There are extensive forests, which shelter elephants and deer; there are also wild cattle and ponies, and the rhinoceros abounds. Among the chief products are rice, betel, areca-nuts, gamboge, spices, sandal-wood, and ivory. Iron occurs. See COCHIN-CHINA.

CAMBOGE. See GAMBAGE.

CAMBON, JOSEPH, 1756–1820; a French financier. He was a member of the national convention of 1792 and of the committee of safety of the next year; and in 1794 promoted the downfall of Robespierre. He is credited with having laid the foundation of the financial system of France. In 1816 he was exiled.

CAMBORNE, a t. of Cornwall, 11 m. n.w. of Falmouth. It is surrounded by very productive copper, tin, and lead mines. C. church has a stone inscription of the 10th century. Pop. '71, 7757.

CAMBRAI, a city of France, in the department of the Nord, about 32 m. s.s.e. of Lille. It is situated on the right bank of the Scheldt, is strongly fortified and well built, with tolerably wide, but irregular streets, and many picturesque old houses. The

cathedral, archiepiscopal palace, town-house, and theater are among the principal public buildings. The city was greatly injured in 1793, when the revolutionists, among other vandalisms, razed the fine cathedral. They also disintombbed the remains of Fénélon, who was archbishop here, and melted his lead coffin into bullets. A monument, however, by David the sculptor was erected (1825) in the new cathedral, in memory of the immortal author of *Télémaque*. The manufactures of the city are important, consisting of cambrie—so called from its manufacture here—linen-thread, lace, cotton-yarn, beet-root sugar, soap, starch, leather, etc. It has also a trade in agricultural produce. The pop. in 1876 was 16,966.

C. was known to the Romans under the name of *Camaracum*, and it was then one of the chief cities of the Nervii. It was fortified by Charlemagne, and was long governed by its own bishops, to whom Charles the Bald ceded it. The celebrated league against the republic of Venice, which comprised the pope, the emperor of Germany, and the kings of France and Spain, was entered into here in 1508, and takes its name from the city. Here also were concluded treaties between the French king and the German emperor in 1529, and in 1724-25, between Charles VI. and Philip V. of Spain. During 1815-18 it was the head-quarters of the British army of occupation.

CAMBRIA, a co. in s.w. Pennsylvania, drained by affluents of the Susquehanna and Alleghany rivers, and intersected by the Pennsylvania railroad; 670 sq.m.; pop. '70, 36,569. It is a high and broken table-land, with abundance of coal and iron. Agriculture is the chief business. Co. seat, Ebensburg.

CAMBRIA, the ancient name of Wales, the Britannia Secunda of the Romans. The name is derived from that of Cimbri or Cymri, by which the Welsh have always called themselves. See BRETTS AND SCOTS.

CAMBRIAN ROCKS, the name given by prof. Sedgwick to the oldest known fossiliferous rocks, on account of their extensive development in North Wales. Their true limits have been the subject of considerable controversy. When Sedgwick first described them, they were considered inferior to the Silurian measures. Subsequent examination has shown that they are the equivalents of rocks previously described by Murchison as lower Silurian; and accordingly geologists generally, following the classification of the government geological surveyors, confine the term to an extensive series of gritstones, sandstones, and slates, which underlie the Silurian lingula beds. In Anglesea these rocks have been metamorphosed in one place into chlorite and mica schists; in another, into gneiss, and all traces of organisms have been destroyed. In North Wales they are less altered, but have as yet proved unfo-siliferous. In the Longmynd (Salop), there is an apparent thickness of 26,000 ft., which may be, however, owing to folds in the beds. A few fossils have been noticed here, consisting of a fucoid plant or two, the tracks of annelids, and the fragments of a supposed trilobite, called *palaeopyge ramsayi*. In Ireland, similar rocks occur, containing two species of a small branched zoophyte, named *oldhamia*, and numerous tracks and burrows of sea-worms.

CAMBRIAN SYSTEM (**CAMBRIAN ROCKS, ante**), rocks belonging to the primordial division of palæozoic time, and comprising the oldest part of the lower Silurian age, appears on the American continent in Newfoundland, Nova Scotia, New Brunswick, Canada, northern New York, Vermont, eastern Massachusetts, the Appalachian mountains, many parts of the Mississippi valley, and under the secondary and younger palæozoic rocks of the Rocky mountains. They are divided by American geologists into the Acadian and Potsdam groups; the former are the oldest of American primordial rocks, and contain a mass, 2000 ft. deep, of gray and dark shales with some sandstones; the latter, also in part sandstone, has in Newfoundland a depth of 5600 ft., but in the valley of the St. Lawrence diminishes to 600 and even 300 feet. The sandstone beds contain ripple marks, mud cracks, layers indicating the wind-drift, and ebb and flow structure, and animal tracks. The Acadian formation yields primordial trilobites of the genera *paradoxides concoryphe*, *agnostus*, and some others; brachiopods of the genera *lingulella*, *discina*, *obo.ella*, and *orthis*; and several kinds of annelide tracks. The Potsdam rocks contain a few sponges, the earliest forms of graptolite, some brachiopods, including, besides the genera in the Acadian beds, *obolus*, *camarella*, and *orthisia*; some pteropods, (*hyolites* or *theca*); two species of *orthoceras*; annelide tracks; trilobites of the genera *concoryphe*, *agnostus*, *dikelocephalus*, *olenellus*, *ptychaspis*, *chariocephalus*, *aglaspis*, and *illænurus*. Barrande found a remarkable uniformity in the organic remains of those parts of this system which he investigated, extending through Europe and America, and named by him the primordial zone.

CAMBRIC, a general term applied to the finest and thinnest of linen fabrics. It is said to be derived from Cambrai, where such goods were first made. Some of the finest cambrics of the present day are produced in Switzerland. Scotch C. is really a muslin, being made of cotton with the fiber twisted very hard, to imitate real or linen cambrie.

CAMBRIDGE, a t. in the state of Massachusetts, on the Charles river, 3 m. to the n.w. of Boston (q.v.). Here, in 1638, within eighteen years after the landing of the Pilgrim Fathers, was founded Harvard university by the Rev. John Harvard, who bequeathed it a legacy of about £780. and which has gradually been endowed to the amount of

1,000,000 dollars, so that its vested income must be at least 60,000 dollars or £12,000. The oldest, it is also generally considered the best, institution of the kind in America. In addition to the collegiate department proper, the university includes a theological, law, scientific, and medical school, and a department for such as wish to prepare themselves for business avocations without going through a classical course. In 1875, the students amounted to 1161. The town of C. is rapidly advancing in population, the census in 1830, 1840, and 1850 respectively having been 6072, 8409, and 15,215; that of 1870 was 39,634. In 1874, the pop. was 50,337.

CAMBRIDGE (*ante*), a city, and one of the co. seats of Middlesex co., Mass., w. of Charles river, which separates the township from the city of Boston, of which C. is practically a part, as Brooklyn is of New York. There are four principal divisions, North, East, Old Cambridge, and Cambridgeport; pop. '70, 39,634. The city spreads over a large extent of territory, and is handsomely laid out in broad avenues with abundance of shade trees, among the most interesting of which is the elm under which Washington assumed command of the revolutionary forces in 1775. The house in which Washington dwelt is now the residence of Longfellow, the poet. The modern residences are generally surrounded with handsomely cultivated grounds, orchards, and flower and fruit gardens. The main feature of C. is Harvard college (q.v.), the buildings of which are in Old C., 3 m. from Boston, occupying a plot of 14 acres handsomely laid out and shaded with ancient elms. At a little distance n.e. of the college are the museum of comparative zoology, founded by Agassiz, the botanical garden, and the observatory, noted as possessing one of the best telescopes in the country. Near the museum are the Harvard law school and the Lawrence scientific school. Another conspicuous building is Memorial hall, erected to the memory of Harvard students and graduates who fell in the war of the rebellion: this is probably not exceeded in grandeur by any college hall in the world. It presents three apartments—a memorial vestibule, the Sanders theater for great academic assemblies, and a dining-hall with accommodation for 1000 persons. The whole structure is 310 ft. long by 115 ft. wide, with a tower 200 ft. high. There is also a granite monument near the college erected by the city in honor of the fallen soldiers. C. also contains Mt. Auburn, one of the most beautiful cemeteries in the world. It occupies 125 acres of hill and valley, laid out in a charmingly picturesque manner, while the monuments show a great variety of taste and munificence. This is the oldest of the splendid burial places in the country, having been dedicated in 1831. Bridges over Charles river connect C. with Boston, Brighton, and Brookline. Horse railroads connect with all adjacent towns, and the Boston and Lowell and the Fitchburg railroads pass through East Cambridge. The streets are well drained, and lighted with gas. C. is not a business place, but rather a home for the business people of Boston. Still there are manufactories of locomotives, steam-engines, glass, carriages, marble, chemicals, brushes, biscuit, candles, soap, chairs, cabinet ware, etc. The Riverside press and the university printing-office, are noteworthy; the last named is the oldest printing establishment in the country. C. has a regular city government, vested in mayor, aldermen, and common councilmen, with the usual executive and judicial courts and functionaries. Water is supplied from two large lakes in the neighborhood, and stored in large reservoirs. Under the influence of the college the schools of the city are of a high order, and to these are added the Dana library and free lectures at the Dowse institute. There are in C. three or four newspapers and about 300 churches or congregations. The first settlement here was in 1630, and was called Newtown, and Winthrop and others intended it to be the chief town in the colony. The first minister, Rev. Mr. Hooker, was settled in 1632. In 1638, money was voted to establish a public school, which was further aided by grants from the Rev. John Harvard of Charlestown. The city charter of incorporation was granted in 1846.

CAMBRIDGE, the chief t. of the co. so named, lies 48 m. n.n.e. of London. It takes its name from the river Cam, which was anciently called the Granta. By the Saxons, C. appears to have been known as Grantabrycege, which is found with many slight variations of spelling, and probably became abbreviated into Cantbridge. It is also supposed that C., and not the adjacent village of Grantchester, was the Grantaceaster of the Saxons. There are, however, traces of a camp at Grantchester. In 870, the Danes ravaged the country hereabouts, and are said to have destroyed the town. King John, in the second year of his reign (1200 A.D.), granted a charter to the town, permitting it to have a guild of merchants, and in 1207, confirmed the burgesses in their privileges in perpetuity. In 1225, they paid a fine of 50 marks for having their liberties; and in 1227, Henry III. confirmed their charters. The town has sent two members to parliament from the earliest period. The university sends two members of its own. The pop. of the municipal borough in 1871 was 30,078, that of the parliamentary borough, 33,996. C. has 18 churches belonging to the church of England, besides chapels belonging to the Baptist, Congregationalist, and other bodies. The most curious church is that of the Holy Sepulchre, which is one of the few in England that have a round tower. The town is not generally pretty or picturesque, but the gardens at the backs of the colleges, by the Cam, are extremely beautiful in the summer months. Its architectural features depend chiefly on the college and university buildings.

CAMBRIDGE, ADOLPHUS FREDERICK, Duke of, 1774-1850; youngest son of George III., and uncle of queen Victoria. He served as an ensign in the army, and was educated afterwards at Göttingen, returning home in his 20th year. In the Netherland campaign of 1793, he was taken prisoner by the French, but was almost immediately exchanged. Thereafter most of his public duty was in Hanover as governor and viceroy, until the separation of Hanover from the British crown in 1837, when he returned to England, mixing no further in public affairs.

CAMBRIDGE, GEORGE WILLIAM FREDERICK CHARLES, Duke of, b. 1819; field-marshal and commander-in-chief of the British armies; first cousin of queen Victoria, son of Adolphus Frederick, duke of Cambridge; succeeded to his title July 8, 1850. In 1837, he was col., and in 1854, lieut. gen. commanding the first division sent in aid of Turkey against Russia. He led the troops at Alma and at Inkerman. In consequence of ill health he returned to England, and in 1856 succeeded viscount Hardinge as commander-in-chief: in 1862, he was given the rank of field-marshal. The duke has never married, but for many years has lived with Miss Fairbanks, once known as a beautiful actress, by whom he has several children.

CAMBRIDGE, UNIVERSITY OF, one of the two ancient institutions of the kind existing in England. Overlooking several fabulous accounts of its origin, its true history may be said to begin at the opening of the 12th century. It was in 1110 that Joffrid, abbot of Croyland, sent over to his manor of Cottenham, near Cambridge, Gislebert, his fellow-monk and professor in divinity, with three other learned monks. These came over to Cambridge, and in a hired barn taught their sciences, and in a short space of time drew together so great a number of scholars, that in the second year of their coming no single building was able to contain them. Perhaps even this statement is doubtful. At any rate, when Alfred of Beverley was student here—viz., 1129 A.D.—there were as yet no public halls or hostels, but each one lived in his own hired lodging.

The first regular society of students was that of Peterhouse, founded in 1257. About this time, students began to live together in hostels, under the rule of a principal, at their own charges. These hostels were named after the saints to whom they were dedicated, the churches which they adjoined, or the persons who formerly built or possessed them. In the year 1280, there were as many as 34, and some of them contained from 20 to 40 masters of arts, and a proportionate number of younger students; but all these hostels decayed by degrees when endowed colleges began to appear. Trinity hostel survived all the rest, and continued to 1540. The hostels were the beginning of what may be called the *college system*, which distinguishes the sister-universities of Oxford and Cambridge from those of Edinburgh, London, and the continent. See UNIVERSITIES.

It was between the latter part of the 13th and the close of the 16th c. that all these royal and religious foundations were endowed which now constitute the university. Hugh de Balsham has the honor of being the first benefactor in this way. Michael house was founded by Hervey de Stanton in 1324, and King's hall by Edward III. in 1332, both of which were absorbed into Trinity college by Henry VIII. in 1546. Clare hall, as it used to be called, one of the earliest and now one of the prettiest colleges in Cambridge, was founded by the countess of Clare in 1326. Henry VI. has left himself an imperishable monument in the splendid foundation of King's college; and his queen, Margaret, commenced the foundation of Queens' college, which was added to by Elizabeth Widville, queen of Edward IV. Lady Margaret, countess of Richmond and Derby, mother of Henry VII., founded Christ's college and St. John's at the beginning of the 16th c., and also the divinity professorship named after her. Henry VIII. appropriated part of the spoils of the monasteries to the foundation of Trinity college, and queen Mary augmented the endowment. The five regius professorships were endowed by Henry VIII. Cambridge was frequently visited by the plague, and university proceedings were suspended by it in 1642 and 1666. In 1643, Cromwell took possession of the town, and the most eminent loyalists were expelled from the university. Almost all the colleges had sent their plate to the king at Nottingham. As might be expected, little was done for the university in this troubled century; indeed no new colleges were added until the founding of Downing college in 1800.

The predominance of the religious element in the college discipline is to be attributed as much to the circumstances and manners of the times in which the colleges were founded, as to the piety of the founders themselves. There had been, from very early times, "religious houses," and these were in many cases united with the new collegiate foundations. There were, for example, the Dominicans, or preaching friars, whose house is now turned into Emmanuel college. The friars who lived in these convents were capable of degrees, and kept their "acts," or exercises for degrees, as other university men. There were, however, frequent quarrels between them and the other students. To the same cause is to be traced the condition of celibacy, upon which, with few exceptions, the fellowships were formerly tenable. Masters of colleges and professors may all marry, and the restriction in the case of fellows has lately been removed or relaxed at most of the colleges. In like manner, the obligation to take holy orders as the condition of holding a fellowship, has been greatly relaxed at all the colleges. At St. Peter's there are 11, and at Trinity hall 10 lay fellowships.

The present university statutes were confirmed by queen Victoria, by order in council, July 31, 1858. The governing body is the senate, and the building where they meet is called the senate-house. All university laws are approved by an elected body called the council, before they are submitted to the senate. The executive powers are intrusted to a chancellor, high-steward, vice-chancellor, commissary, and assessor. The public orator is the voice of the senate upon public occasions. The proctors superintend the discipline and morals of all persons in *statu pupillari*; they are present at all congregations of the senate, read the "graces," and take the votes. The registry is responsible for the graces being offered in due form, and has charge of the university records. There are three terms in this university—the Michaelmas or October term, the Lent term, and the Easter term. To take an ordinary B.A. degree, a student must reside nine terms. The M.A. degree follows three years after. Dissenters are not excluded by the terms of the new statutes from taking degrees, except in divinity.

With respect to the admission of students, their university course, expenses, and proceedings in degrees, the following information may be useful: There are four classes of students—viz., *fellow commoners* and *noblemen*, *pensioners*, *sizars*, and the more distinguished students who are elected *scholars* on the foundation of their college. The first class are so called from their dining at the fellows' table; they wear silk or embroidered gowns, and pay heavier fees. The pensioners are the great body of students who are not on the foundation, and who pay for their own commons, viz., dinners in hall, etc., and for their chambers. The sizars are the poorer students, who are admitted at lower charges than the pensioners, but wear the same dress, and are no longer subject to the performance of menial offices as they once were. Some of the colleges, especially St. John's and Trinity, have very liberal endowments for the sizars, and very considerable pecuniary assistance is given to the more deserving of them, so that no youth of real ability, industry, and good character, need be deprived by poverty of the advantages of a university education. Non-collegiate students have lately been admitted to the university under special rules. The scholars are elected, by examination, from the pensioners and sizars; they are on the foundation of the college, have rooms and commons free, and other emoluments. The fellows are subsequently elected from the scholars and the students who have distinguished themselves in the tripos examinations. Vacancies are, as a rule, filled up from members of the college, but many fellowships are open to the competition of the whole university. The usual age of admission is from 17 to 20. Before a student can be admitted, he must obtain a certificate from some master of arts of the university of being sufficiently instructed in Latin, Greek, and mathematics; this certificate must be sent to the tutor of the college, along with the caution-money, which, in the case of a pensioner, amounts to £15. At some colleges there is an examination previous to matriculation in addition to the above.

Residence is commenced in the October term. It is usual, particularly at the larger colleges, to have the name entered on the college boards for a term or two previous; but this is not necessary now, as it used to be, in order to *keep* such terms with a view to the degree. When the undergraduate comes into residence, he is called a "freshman;" in his second year, a "junior soph;" in his third year, a "senior soph." The ordinary B.A. or bachelor of arts degree, may be taken in the ninth term of residence—viz., in the third June after coming up. The subjects of examination are partly fixed, partly variable. They are the Acts of the Apostles in Greek, one Greek and one Latin classic, *The History of the English Reformation*; *Euclid*, books i., ii., iii., iv., and propositions 1-6 of book vi.; together with certain parts of algebra, mechanics, and hydrostatics. The candidates for examination for degree are called questionists.

Candidates for mathematical "honors" do not go up till the end of their tenth term—i.e., the Christmas three years after coming up. The examination embraces the whole range of pure mathematics, and mathematics as applied to natural philosophy. The successful candidates are arranged in a tripos—i.e., in three classes, called respectively wranglers, senior optimes, and junior optimes; the first mathematician of the year is called the senior wrangler. The Smith's prize examination for the best mathematician sometimes reverses the decision of the tripos.

The examination for classical "honors" is one term later still, and the candidates are arranged in a tripos, and distinguished as first, second, and third class. Very accurate scholarship is required to obtain a good place in this tripos. The examinations for degree are called "great go." The previous examination, which comes in the second year of residence, is called "little go." Students who intend to graduate in classical honors, are required to take mathematical honors in little go. The previous examination is one Greek and one Latin author, one of the gospels in Greek, Paley's *Evidences of Christianity*, and elementary mathematics. After passing the "little go," the examinations for the ordinary B.A. degree consist of a "general" and a "special" examination, the subjects in the former being similar to those in the little go. The special examination is, at the option of the student, in theology, moral or natural or applied science, or law. The following are the professors: Regius professors of laws, physic, Greek, Hebrew, and divinity, professor of moral philosophy, professor of chemistry, professor of anatomy, professor of modern history, professor of botany, professor of geology, Jacksonian professor of natural philosophy, Downing professors of law and medicine, professor of mineralogy, professor of political economy, professor of archæol-

ogy, professor of music, a lady Margaret, a Hulsean, and a Norrisian professor of divinity, two Arabic professors, a Sadlerian and a Lucasian professor of mathematics, a Lowndean and a Plumian professor of astronomy, Slade professor of fine art, professors of Latin, Sanscrit, international law, zoology, experimental physics, and mechanism. Degrees in honors are given in law and in natural and moral science, without requiring further proficiency in the normal studies of the place, classics and mathematics, than is ascertained by passing the little go. The fees for the different degrees will all be found in the *Cambridge Calendar*. There are different fees at the different colleges in addition to the university fees. It will be sufficient to state, that for the B.A. and M.A. degrees, the fees amount to about £12 and £25 respectively.

The great prizes at the university are the *fellowships*, of which there are about 360, some open to all candidates without restriction, but conditions of tenure as to marriage and holy orders vary at different colleges. Their value varies from £100 to £300 per annum, and the senior fellowships are often £500 or more. There are also stipends attached to all the college offices—e.g., those of dean, bursar, steward, etc. The office of tutor is one of great honor and emolument. The chancellor gives annually two gold medals, open to the competition of all students qualified to be candidates for the classical tripos of the year. The members of parliament for the university give annually four prizes for the best dissertations in Latin prose. There are numerous other university distinctions, both scholarships and of other kinds, for an accurate account of which the *Cambridge Calendar* should be consulted.

The following is a list of the colleges in the order of their antiquity. A particular notice of each college (except Cavendish) will be found in its alphabetical place:

Name.	Founded.	Undergraduates in 1875.
St. Peter's college, or Peter-house.....	1257	37
Clare college.....	1326	85
Pembroke college.....	1347	78
Gonville and Caius college.....	1348	139
Trinity hall.....	1350	140
Corpus Christi, or Benedict college.....	1351	144
King's college.....	1441	28
Queens' college.....	1448	38
St. Catharine's college or hall.....	1473	57
Jesus college.....	1496	144
Christ's college.....	1505	108
St. John's college.....	1511	381
Magdalene college.....	1519	50
Trinity college.....	1546	522
Emmanuel college.....	1584	63
Sidney Sussex college.....	1598	46
Downing college.....	1800	51
Cavendish college.....	1876	..

Students whose names are not on the boards of any college, and are allowed to pursue their studies and proceed to degrees, were 82 in number at the above date.

Few of the colleges present an imposing façade to the streets—King's is, perhaps, the only one of which this may be said—but the quiet and picturesque beauty of the courts in the interiors is very pleasing. Dr. Whewell, the late master of Trinity college, built a new hostel in connection with Trinity, which is considered to be in very good taste. Amongst the other public buildings of Cambridge are to be mentioned the senate-house, where university examinations are held, degrees conferred, and all public business of the university conducted. The Fitzwilliam museum is the finest of the modern additions to the university. Viscount Fitzwilliam bequeathed, in 1816, £100,000 South-sea annuities, the interest of which was to build and support a museum. He left also a very valuable collection of books, paintings, etc., as a nucleus for future contributions. G. Basevi was the architect. The university library is a fine mass of buildings of different periods, and contains at present more than 170,000 volumes. The geological museum contains the original collection of Dr. Woodward, which, out of respect to the founder, has been kept in its original state, unmixd with more recent and vastly more numerous and interesting acquisitions. The university is indebted for many of these geological treasures to the late prof. Sedgwick. The mineralogical room contains the valuable collections of the late sir A. Hume, Charles Brooke, and Henry Warburton. The Pitt press is a Gothic structure built in honor of Mr. Pitt, who was educated at Cambridge. It contains the university printing-offices, which are very extensive. There is also a good anatomical museum.

There is a very good hospital, founded under the will of Dr. Addenbrooke in 1753. The observatory contains some very fine instruments, amongst which is a large equatorial telescope, presented by the duke of Northumberland in 1835. The income of the university is about £2000, and the aggregate income of the colleges about £200,000 per annum.

For the most recent information about the university studies, etc., the Cambridge

Calendar for the current year should be consulted; for the history, biography, and antiquity, see Fuller's *History of Cambridge*; Dyer; Caius; Le Keux' *Memorials*; Cooper's *Annals*; Cooper's *Athenæ Cantabrigienses*; *Graduati Cantabrigienses*.

CAMBRIDGE PLATFORM, the system of church discipline agreed upon by the representatives of the New England churches at the synod held in Cambridge in 1648. In regard to doctrine they adhered substantially to the Westminster confession, though they did not impose that on the churches; but they did not accept that confession which was Presbyterian with respect to church order and polity, for regulating which they constructed the Cambridge platform, which declares that the form of church government is one and immutable, and prescribed in the word of God. According to this platform, the church in general consists of the whole company of the redeemed; but the state of the visible church militant was before the law economical, or in families; under the law, national; and since Christ, only congregational, or in local companies. In number a church ought not to be greater than may ordinarily meet together conveniently in one place, nor fewer than can conveniently carry on church work. The supreme power of the church belongs to Jesus Christ, who deposes extraordinary power to apostles, etc., and ordinary power to every particular church; officers are necessary to the well-being but not to the being of a church. Extraordinary officers, as apostles, are temporary; the ordinary, which are bishops (the same as elders or pastors) and deacons, are perpetual. A deacon's official acts are confined to temporal affairs. Any church may elect and depose its own officers, but in so doing the advice of neighboring churches should be sought. Ordination is the solemn putting a man into his office; it follows his election. In respect to Christ, the head, the church is a monarchy; in respect to the body or the brotherhood, it is like a democracy; in respect to the presbytery, or company of ministers, it is an aristocracy. Synods, though not necessary to the being, are useful to the well-being of the churches; but synods are not permanent ecclesiastical bodies. It is declared that local churches are of right distinct, equal, self-governed under Christ; yet that they should be gathered and should proceed in communion with each other; which communion they are to exercise by mutual care, by consultation, by admonition, by sharing in acts of worship, by needful transfer of members, by relief and succor. Synods have not power of church-censure and discipline, but are to declare the principles on which such acts are based, and their decisions are to be submitted to if found consonant with the word of God. The platform deals also, as its date required, with the relation of civil magistrates to affairs ecclesiastical. The platform is accepted and largely followed by the congregational churches as a useful guide, and as a strong presentation of the principles of church order given in the New Testament; but its enforcement upon any church as an authoritative rule would of course be attempted in vain.

CAMBRIDGESHIRE, an inland co. of England, in lat. 52° 1' to 52° 45' n., long. 0° 31' e., and 0° 16' west. Its greatest length, from n. to s., is about 50 m., and its breadth 30 m., with an area of 820 sq. miles. Pop. '71, 186,906. About three fourths of the co. consists of arable land, meadow, and pasture, the rest being fens. The surface of C., except in the s., which is somewhat elevated and on the chalk formations, is marshy and flat, thinly wooded, and with villages and churches here and there on slight elevations, called "eys" or islands. The upper greensand, which in some places near Cambridge comes to the surface, yields in rich abundance the curious fossils miscalled coprolites (q. v.), which are of great value as an artificial manure. Their value is in some places equal to that of the land itself. The northern part of C. forms part of the Bedford level. The chief rivers are the Ouse, which crosses the middle of the county from w. to e., with its tributary the Cam; the Nene, which borders the co. on the n.; and the Lark. These are all navigable to a certain extent. C. is an agricultural county. In the higher parts, the land produces fine crops of beans and wheat. Many cattle and sheep are now supported on the thin, chalky soils. The black spongy soil of the fens consists of mud mixed with decayed vegetable matter, and, when drained and burned, produces, in dry years, heavy crops of cole-seed, wheat, oats, barley, hay, potatoes, hemp, and flax. Horses, cattle, sheep, and pigeons are also reared in the fens. The isle of Ely, part of the fen-tract, and within the Bedford level, is famed for garden vegetables; and the meadows of the Cam yield fine butter and cream-cheese. The chief towns of C. are Cambridge, the co. town; Ely, Wisbeach, March, Thorney, Linton, Solham, Newmarket, and Royston. The manufactures of C. are mostly such as belong to an agricultural county. There are paper and parchment mills, and coarse earthenware is manufactured. Needle-making is also carried on to some extent. C. returns 3 members to parliament. This co. was anciently the seat of a powerful tribe—the Icenii. It was crossed by several British and Roman roads, in some parts now covered by several feet of peat-soil. Remains of Roman camps, sea-embankments, and villas, occur, and Roman antiquities, as coins and urns, have been found. There are some ancient—supposed pre-Roman—ditches miles in length. One of these, the Devil's ditch, with an elevated vallum, having a slope of 52 ft. on one side and 26 ft. on the other, is about 100 ft. broad. In the 9th and 10th c., C. was the scene of severe contests between the Danes and Saxons. The isle of Ely and its monks withstood William the conqueror for 8 years. C., and especially the isle of Ely, suffered much in the civil wars of Stephen,

John, Henry III., and Charles I. There formerly existed 36 religious houses in Cambridgeshire. Since Charles I.'s time, much fen-land has been reclaimed by embanking rivers and cutting new channels.

CAMBRONNE, PIERRE JACQUES ETIENNE, 1770—1842; a French general of great renown for daring bravery, and a devoted servitor of Napoleon, whom he accompanied to Elba. He was in command of the imperial guard at Waterloo, and when entirely surrounded, and the battle utterly lost, he contemptuously refused to surrender, but fought until literally cut down. He was nearly killed, but lived to go to London, where he heard that in France he was charged with an attack upon his own country, to answer which he at once went to Paris and demanded a trial. This was granted, and he was honorably acquitted, and after the revolution of July he was restored to his rank in the army.

CAMBUSLANG, a parish and mining village in Lanarkshire, celebrated in the revivals of 1741. See **WHITEFIELD**.

CAMBYSES, second king of the Medes and Persians, was the son of Cyrus and Casandane, and succeeded his father in the monarchy, 529 B.C. C. is the Greek form of his name, the ancient Persian name is Kabujiya. In 525 B.C., C. invaded Egypt, defeated Psammenitus, the king of Egypt, at Pelusium, and in six months made himself master of the whole country. He meditated further conquests, but was not permitted to carry his designs into effect; the Tyrians, upon whom his maritime power depended, refused to serve him against the Carthaginians; an army which he sent to take possession of the temple of Jupiter Ammon, perished in the desert; and one which he led in person against the Ethiopians, was compelled to return from want of provisions. C. now addicted himself to excessive intoxication, and perpetrated horrid cruelties in Egypt; the accounts of which, however, depending upon his enemies the Egyptian priests, are doubtless exaggerated. It is probable, however, that his tendency to epileptic fits, along with the arbitrary disposition induced by success and power, caused him to indulge in violent and capricious acts of tyranny. The Egyptians believed him to be mad. A pretender to the Persian throne having appeared, C. marched against him, but died on the way in Syria, 521 B.C.

CAMDEN, a co. in s.e. Georgia, on the ocean and the Florida border, n. of St. Mary's river, and including Cumberland island in the Atlantic; 600 sq.m.; pop. '70, 4615—3157 colored. It is level, with sandy soil, rice being the chief production. Co. seat, Jeffersonton.

CAMDEN, a co. in central Missouri, on the Osage river, and touched by the Atlantic and Pacific railroad; 600 sq.m.; pop. '70, 6108—149 colored. It has lead mines, and an undulating surface, and tolerably fertile soil, producing tobacco, corn, wheat, etc. Co. seat, Lynn Creek.

CAMDEN, a co. in s. w. New Jersey, e. of Delaware river, traversed by five railroads, all centering at Camden, the chief town, opposite Philadelphia; 220 sq.m.; pop. '70, 46,193. Surface mostly level and fruitful, producing grain, butter, milk, vegetables and fruits for city markets. Co. seat, Camden.

CAMDEN, a co. in n.e. North Carolina, n. of Albemarle sound and e. of Pasquotank river; 280 sq.m., a portion of which is in the Dismal Swamp; pop. '70, 5631—2121 colored. The Dismal Swamp canal extends in this county to the Pasquotank at South Mills. Productions—corn, sweet potatoes, and cedar and cypress timber. Co. seat, Camden Court-House.

CAMDEN, the seat of justice in Wilcox co., Ala., 33 m. s.w. of Selma; pop. '70, 3060—2225 colored. The village is on an eminence 4 m. from the Alabama river, and is the center of an important trade.

CAMDEN, the seat of justice of Washita co., Ark., 82 m. s.w. of Little Rock, at the head of navigation on the Washita river, in a good situation for trade; pop. '70, 1612—612 colored. The place was formerly a rendezvous for hunters.

CAMDEN, a city of New Jersey, U. S., on the left bank of the Delaware river, opposite Philadelphia, with which it is connected by 4 steam-ferris. It is the terminus of the Camden and Amboy, Camden and Atlantic, and West Jersey railways. It has a court-house, 2 banks, 2 railway depots, 15 churches, ship-yards, iron-works, foundries, manufactories of machinery, etc. Pop. '70, 20,045.

CAMDEN (*ante*), a city in New Jersey, opposite Philadelphia, 87 m. from New York, and an important railroad and shipping point; pop. '70, 20,045. The streets are on the rectangular plan, but wide, and the city shows many fine buildings, including the railroad depots, opera house, etc. There are iron foundries, chemical works, and some other manufactories. C. was chartered as a city in 1831.

CAMDEN, in Kershaw co., S. C., 102 m. n.w. of Charleston, at the terminus of the C. branch of the S. C. railroad; pop. '70, 1007—555 colored. Two battles were fought in the vicinity in the war of the revolution; the first on Aug. 16, 1780, when the English commander Cornwallis defeated Gates and the revolutionary forces, mortally wounding baron De Kalb; and a less important engagement a year later, when Greene and the Americans were repulsed by the English under Rawdon. In 1825, a monument

was erected at Camden to the memory of De Kalb, the corner-stone of which was laid by Lafayette.

CAMDEN, a co. in s.e. New South Wales, Australia, on the Pacific ocean; 2200 sq.m.; pop. '66, 22,734, but now much larger. It is the largest grain-producing county in the colony; has iron mines, and vast herds of cattle. Capital, Berrima.

CAMDEN, CHARLES PRATT, Earl of, a younger son of sir John Pratt, chief justice of the court of king's bench in the reign of George I., was b. in 1714. Educated at Eton and Cambridge, he studied for the law, and was called to the bar in 1738. Not until 1752, however, when he defended a bookseller successfully against a government prosecution for libel on the house of commons, did C.'s prospects appear very promising; from this time his success was certain. In 1757, he was appointed attorney-general, and four years afterwards, accepted a seat on the bench in the court of common pleas. Judge in the trial of Wilkes, he declared his opinion emphatically that the action of government in this case, by general warrants, was altogether illegal—an opinion which, chiming in with public sentiment at the time, made him the most popular of judges. In 1765, he was created baron C. of Camden place, Kent, by the Rockingham administration; to whose American policy, and to their treatment of Wilkes, notwithstanding, he offered constant opposition. The following year, when he was made lord chancellor, he did not abandon his principles; and four years after—the duke of Grafton being then prime minister—he supported an amendment made by Chatham on the government address, and resigned his place. His judicial career ended here; henceforth, he was entirely a political character, and for more than 20 years took an active part against the ill-advised American policy pursued by lord North, and in discussions on the law of libel, in which he maintained the popular view. As a judge, he is held in high estimation, though his manner was somewhat undignified. He filled the office of president of the council in the Rockingham administration in 1782, and also from the following year until his death, under Pitt. He died April, 1794.

CAMDEN, WILLIAM, one of the most distinguished scholars and historians, and the most laborious and painstaking antiquary of the 16th c., was b. in London, where his father was a paper-stainer, in May, 1551. His education, commenced at Christ's hospital, was completed at St. Paul's school, and at Oxford. In 1575, he was appointed second-master of Westminster school; and it was while discharging the duties of this office that he undertook the work which has made his name famous, his *Britannia*, giving an account of the British Isles from the earliest ages, which, written in elegant Latin, was first published in 1586. It at once brought him into communication with the learned men of his time. Before 1607, the work had passed through six editions, being greatly enlarged and improved by the indefatigable industry of the author. The book, at first but a comparatively small single volume, has received much additional matter from other writers. The best known edition of C.'s *Britannia*, is that of Edmund Gibson, in English, 2 vols. fol. Of this great work of C. bishop Nicolson said it was "the common sun wherewith our modern writers have all lighted their little torches." In 1593, C. was appointed head-master of Westminster school; and four years later, he was made clarencieux king-at-arms, an appointment which gave him more time for the pursuit of his favorite studies. His other most important works are—*Annals of the Reign of Elizabeth*; *A Collection of Ancient English Historians*; *An Account of the Monuments and Inscriptions in Westminster Abbey*; and a *Narrative of the Gunpowder Plot*. He died in 1623, at the age of 72, and was buried in Westminster Abbey. Before his death, he endowed a professorship of history at Oxford. The "Camden Society," for the publication of early historical and literary remains, is so named in his honor.

CAMEL, *Camelus*, a genus of quadrupeds of the order *ruminantia*, of which only two species exist, both of great use to mankind. This genus is the type of the family *camelidae*, to which there belongs only one other genus, *uchenia* (q.v.), including the llama, alpaca, etc. The whole number of species of *camelidae* is, therefore, very small, and they seem to belong originally to limited regions, both in the old world and in the new. To the peculiarities of these regions, they exhibit a wonderful completeness of adaptation. The family is regarded as forming a sort of link between the orders *ruminantia* and *pachydermata*. The dentition differs from that of all other ruminating animals, particularly in the presence of incisors or cutting teeth in the upper jaw; camels having also canine teeth in both jaws, and the llama and its congeners in the lower jaw of both sexes; and differences equally important appear in the feet, which have not the cloven hoof common to all the rest of the order—two short toes with separate hoofs adapted to one another—but two elongated toes, each tipped with a small nail-like hoof, the feet resting not upon the hoofs, but upon elastic pads or cushions under the toes.—In the camels, the toes are united by a common sole, thus resting upon one extended pad, instead of having each a separate one, as in the genus *uchenia*; the broader expanse of the foot enabling the animals of the one genus more easily to traverse the loose sand of the desert, whilst the separation of the toes in the other is suited to the uneven surface of rocky heights. The camels are also distinguished by the females having four teats, whilst those of the other genus have only two; and by a hump or humps upon the back, of which the llama and its congeners exhibit no trace. The long neck, small head,

prominent eyes, and tumid and cleft upper lip, with considerable prehensile power, are common to both genera; but with much similarity of form, as well as of particular characters, the *camelidæ* of the Andes exhibit a gracefulness of outline which strongly contrasts with the gaunt angularity of those of the eastern deserts. Camels are indeed animals of uncouth appearance. Of the two species, that known as the Arabian C. (*C. dromedarius*) has only one hump on the back, whilst the bactrian C. (*C. bactrianus*) has two. Some confusion has arisen from the occasional employment of the name dromedary as a designation of the former species, it being, however, more properly limited to a particular variety of that species, more slender and graceful than the ordinary variety, and of much greater fleetness. Buffon's notion, that the hump is a badge of servitude, and the consequence of harsh treatment throughout many generations, is singularly at variance with what we know of its uses. The hump on the C.'s back is a wonderful provision of nature, to adapt the animal to the endurance of long abstinence from food, or subsistence on very scanty supplies, to which it is often subjected in the desert, and without a capacity for which it would be comparatively of little value to man; and the wide deserts across which he journeys and transports his merchandise by its aid, would be altogether unpassable. The hump is, in fact, a store of fat, from which the animal draws as the wants of its system require; and the Arab is very careful to see that the hump is in good condition before the commencement of a journey. After it has been much exhausted, three or four months of repose and abundant food are necessary to restore it. The backbone of the C. is as straight as that of other quadrupeds.—Another very interesting adaptation to the desert is to be noticed in the thick sole which protects the feet of the C. from the burning sand, and in callosities of similar use on the chest and on the joints of the legs, upon which the C. rests when it lies down to repose, or kneels, as it does for various purposes, and is taught to do that it may be loaded, or that its rider may mount upon its back.—The wedge-shaped cutting-teeth of the lower jaw are also particularly fitted for browsing on shrubby plants, such as the desert produces—the camel's thorn, tamarisk, etc., which form a large part of the food of the C.; the eyes are furnished with long eyelashes, to protect them from the glare and from the drifting sand; whilst the exclusion of the sand from the nostrils is also provided for by a power of closing their oblique openings at will. But most interesting of all is the provision made for the C.'s endurance of long drought, by the lining of the inside of the second stomach, or honeycomb-bag, and of a portion of the first stomach or paunch, with great masses of cells, in which water is stored up and long retained. This store of water is well known to the Arabs, who, when sore pressed by thirst, sometimes avail themselves of it by killing some of the camels of the caravan.—The first stomach of the *camelidæ* is divided into two compartments by a muscular band—one of the points of difference between them and the other ruminants. Muscular bands, proceeding from this principal one, and intersected by other muscular bands, nearly at right angles, form the cells for containing water. It may be added here, that the senses both of sight and smell are extremely acute in the C., and that it is capable of discerning water at a great distance.

The Arabian C. carries twice the load of a mule. The Bactrian C. is sometimes loaded with 1000 or even 1500 lbs. weight, although not generally with so much. The East India company had at one time a corps of camels, each mounted by two men, armed with musketoons. The use of the C. for the conveyance both of travelers and merchandise has won it the name of the *ship of the desert*. A caravan sometimes contains 1000, sometimes even 4000 or 5000 camels. The supply of food carried with the caravan for the use of the camels is very scanty: a few beans, dates, carob-pods, or the like, are all that they receive after a long day's march, when there is no herbage on which they may browse. The pace of the loaded C. is steady and uniform, but slow; it proceeds, however, from day to day, accomplishing journeys of hundreds of miles at a rate of about $2\frac{1}{2}$ m. per hour. Some of the slight dromedaries, however, can carry a rider more than 100 m. in a day. The motion of the C. is peculiar, jolting the rider in a manner extremely disagreeable to those who are unaccustomed to it; both the feet on the same side being successively raised, so that one side is thrown forward, and then the other.

The C. produces only one young one at a time, or rarely two. It lives 30 or 40 years.

The patience of the C. has been celebrated by some authors; and the cries by which it expresses its sense of injury when a heavy load is placed upon its back have been pathetically described. With all its general submissiveness, however, the C. is resentful of injury, and during the rutting season it becomes particularly vicious.

The flesh and the milk of the C. are much valued by the Arabs as articles of food. The dung is used for fuel, and it was from the soot of this dung that the sal-ammoniac, formerly imported from Egypt, was obtained by sublimation, whilst the sources from which that substance is now procured were unknown. The hair is used for the manufacture of cloth, some kinds of which are coarse, and others comparatively soft and fine. C.'s hair is also imported into Europe for the manufacture of the pencils or small brushes used by painters. The C. can now scarcely be said to exist anywhere in a wild state. It has lately been introduced into Australia.

A fossil species of C. (*C. Sivalensis*), larger than either of the existing species, has been discovered in the tertiary deposits of the Sewalik hills, in Hindustan.

CAMEL, a machine for floating ships over shoals and bars. A long water-tight box, or caisson, nearly filled with water, is sunk on either side and attached to the ship, and then the water in the caissons is pumped out, adding additional buoyancy as they become empty. The C. is sometimes employed in raising sunken ships, and the principle is applied to dry-docks in some instances.

CAMELFORD, a t. in the n.w. of Cornwall, near the source of the Camel (crooked brook), 14 m. w. of Launceston. It lies in a high and hilly tract near the moors. Pop. about 1600. C. is said to have been the scene of a battle, in 542, between King Arthur and Mordred, his nephew, when both were slain. The West Saxons, under Egbert, had a battle with the Britons here in 823. The ruins of King Arthur's castle, Tintagel, stands on the high rocky coast, 4 m. n.w. of Camel Ford. Two m. n. of C. are the celebrated slate-quarries of Delabole, employing a large number of men. Macpherson, the author or translator of Ossian, was member of parliament for C. in 1791, but the reform act of 1832 disfranchised the borough.

CAMELLIA, a genus of plants of the natural order *ternstroemiaceæ* (q.v.), natives of China, Japan, and the n. of India—some of which are now among the most common and admired green-house shrubs in Britain and other countries too cold for their cultivation in the open air, receiving the same sort of attention which is bestowed on other florists' flowers, and with the same result, of an endless multiplication of beautiful hybrids and varieties. The best known and most esteemed is *C. Japonica*. Its leaves are ovate-elliptical, almost acuminate and serrate, shining; the flowers without stalks, mostly solitary, large, and rose-like. It is a native of Japan; and there and in China it has been carefully cultivated from time immemorial. In its wild state, it has red flowers; and the red single C. is much used by gardeners as a stock on which to graft the fine varieties, the flowers of which are generally double, and in many cases most completely so. Many of them are of Chinese or Japanese origin; many have been raised by cultivators in Britain, continental Europe, and America. Their colors are very various; and the varieties also differ much in the form and position of the petals. It adds to the value of the C. that its flowering time is in autumn, winter, and spring. By those who can afford the expense, entire houses are often devoted to the culture of camellias. Some cultivators are careful to protect them from direct sunshine, others recommend an opposite treatment in this particular; it is agreed by all that free access of air is of great importance, and that water must be given very liberally, yet with such caution that the soil may never remain soaked after the immediate wants of the plant are supplied. The cultivation of camellias in the windows of houses is often attended with disappointment, from the buds dropping off when almost ready to expand, which is generally owing either to a neglect or an excess of watering; an apparently slight mistake, either of the one kind or of the other, being very speedily productive of this evil. Too much heat at this time is also apt to cause the flower-buds to fall off. The C. flowers well, when the temperature is kept not very much above the freezing-point, but frost it cannot bear. In the s. of England, some of the varieties are occasionally trained to walls in the open air, receiving a little protection in winter. The proper soil for camellias is a loose black mold; a little sand and a little peat are often advantageously mixed with loam to form it. Camellias are often propagated by cuttings, often by layers; but the finest varieties very generally by grafting or by inarching. The single C. is also propagated by seed, and in this way the best stocks for grafting are procured.—Of the other species of C., the most hardy, and one of the most beautiful, is *C. reticulata*, from which not a few of the varieties now in cultivation are partly derived.—*C. oleifera* is extensively cultivated in China—not, however, in the more northerly parts—for its seeds, from which an oil is expressed after boiling, very similar to olive oil, and much in use as an article of food and otherwise in the domestic economy of the Chinese. The seeds of almost all the species, however, yield this oil.—*C. Sasanqua* bears the name of **SASANQUA TEA**. It is cultivated in China for the sake of its flowers, which are said to be used for flavoring certain kinds of tea.

CAMELLIA CÆÆ, an order of exogenous trees and shrubs in s. and e. Asia and South America; North America has four species. The tea plant and the camellia are specimens.

CAMELOPARDA'LIS. See GIRAFFE.

CAMELOPARDA'LIS, a constellation defined by Hevelius, between the pole-star, Auriga, Cassiopeia, and the head of Ursa Major, consisted of stars of the 4th and lower magnitudes, forming, in imagination, the shape of a giraffe.

CAMEL'S HAIR is woven by Persians and Arabs into material for tents and clothing. In early ages rough garments of this stuff were worn by monks and priests by way of penance. A fine article of camel's hair is used for pencils by artists.

CAMELS HUMP, or **CAMEL'S BACK MOUNTAIN**, one of the peaks of the Green mountains, 4188 ft. high; 17 m. w. of Montpelier, Vt.

CAMEL'S THORN, *Alhagi*, a genus of plants of the natural order *leguminosæ* (q.v.), sub-order *papilionaceæ*, containing a number of herbaceous or half-shrubby species, natives chiefly of the deserts of the east, having simple leaves, minute stipules, racemes of red flowers, and jointed pods with one seed in each joint. These plants are of great

importance on account of the food which they afford for camels, where other vegetation is far from being abundant; and camels are particularly fond of them. *A. camelorum*, a herbaceous species, yields a kind of manna (q.v.), which appears in the form of drops, as of honey, on the leaves, and gradually hardens. A similar exudation is yielded by *A. nipalensis*, another herbaceous species; but it is not certain that the manna of Persia and Bokhara is produced, as has been alleged, by *A. maurorum*, a shrubby species 2 or 3 ft. in height, which certainly does not yield it in India or Egypt; the supposition that this exudation results from some peculiarity in the climate of Persia and Bokhara, being perhaps less probable than that of a mistake concerning species not very dissimilar.

CAM'ENÆ, nymphs with prophetic powers in Roman mythology, named Egeria, Carmenta, Antevorta, and Postvorta. The poets sometimes give the name to the nine muses.

CAM'ENZ, or KAMENZ, a t. in Saxony, 23 m. n.e. of Dresden; pop. '71, 6406. In 1742, the town was nearly destroyed by fire. Lessing was born here, and in 1826 a public hospital was dedicated to his memory.

CAMEO (Ital. *camei*). Gems cut in relief are called cameos, in opposition to those that are hollowed out so as to yield a raised impression, which are called *intaglios*. The term C., however, is applied more especially to those diminutive pieces of sculpture which are prepared from precious stones having two strata or layers of different colors, the undermost of which is left to form the background, the object to be represented being cut in the upper one. The stone generally used for this purpose by the ancients was the variegated onyx.

The art of cameo-cutting is of great antiquity. It is believed to have been of Asiatic origin, and to have been practiced by the Babylonians, from whom the Phœnicians carried it into Egypt. From the Egyptians, it was transmitted to the Greeks, who brought it to great perfection; and latterly it was practiced very extensively, and more successfully than perhaps any other art, in Rome. To what extent the gems, commonly called Etruscan, are in reality early Greek, is a subject of dispute amongst the learned. It was not till a comparatively late period—the age following Praxiteles—that cameo-cutting became popular in Greece; and it was in the courts of the successors of Alexander that it was chiefly patronized. At this period, cameos were very extensively used, not only as personal ornaments, but in cups, vases, candelabra, and other objects of domestic luxury. Patere and other vessels were frequently worked out of a single stone, upon which were exhibited a whole series of figures of the most exquisite workmanship. Many of the antique cameos which have been preserved are wonderfully beautiful both in design and execution. The finest specimen in existence is said to be the Gonzaga C., formerly at Malmaison, now at St. Petersburg. It represents the head of a prince and his wife, probably Ptolemy I. and Eurydice. Winckelmann mentions a C. representing Perseus and Andromeda, in such high relief, that almost the whole contour of the figures, which are of the most delicate white, is detached from the ground. It belonged to the painter Mengs, and at his death was purchased by the empress Catharine of Russia. The only other gem which Winckelmann is disposed to rank with that just mentioned, is "the Judgment of Paris" in the cabinet of the prince Piombino at Rome. Of cameos of the Roman time, many fine specimens are to be found in the continental museums. The most celebrated C. in England is the "Cupid and Psyche," in the Marlborough collection, by Tryphon, who is supposed to have lived in Macedon under the immediate successors of Alexander. The stones on which many of these cameos are cut are of surprising, and, in modern times, unequalled size and perfection. They are supposed to have been procured by the ancients through their oriental and African commerce. Cameos do not seem to have been made in mediæval times; but the art revived in Italy, under the auspices of the Medici; and the production of cameos, both in *pietra dura* and in shell, has there become a branch of art-manufacture of considerable importance. Impressions from antique cameos in glass, sulphur, porcelain, and other materials, are produced in many places; and for artistic purposes, possess all the value of the originals.

Glass Cameos.—The manufacture of cameos from artificial substances was not unknown to the ancients. One of the most beautiful specimens of an imitation of C. in glass is the famous Barberini or Portland vase, now in the British museum. The ground is blue, the figures, which are in low relief, being of a delicate, half-transparent white. See PORTLAND VASE. Many fragments of the same kind of manufacture exist in other cabinets, but that which we are fortunate enough to possess is believed to be the only perfect example.

Shell Cameos.—The art of imitating cameos in shell, which has now attained to such perfection as to rival the delicacy and finish even of antique workmanship, and which is a process quite as artistical as their production from gems, is of modern invention. The shells, like the stones, chosen for this purpose, are such as possess layers of different colors. The most useful are the *bull's mouth*, the under layer of which is red, resembling the sardonyx; the *black helmet*, which has a dark onyx ground; and the *queen's conch*, of which the ground is of a pinkish hue. These shells have three strata, the undermost of which forms the ground, the figure being sculptured in the second, and the third serving to mark the hair, wreaths, armor, and other more prominent objects. The portion of shell having been prepared of the requisite size, form, and thickness by various

mechanical means, it is fixed by some adhesive substance—usually rosin—to a small block of wood, of such form and thickness as to be conveniently grasped by the artist in his left hand. The outline of the object or objects to be represented is then sketched with a pencil, and, in the case of portraits, is usually copied from a previous pencil-sketch on paper. The pencil-marking on the shell is then followed with a scratch-point, and the surrounding white substance is removed by means of files and gravers. This latter process, which is more mechanical than the rest, is usually performed by an assistant. The artist then proceeds slowly and carefully to work out his subject by the use of smaller tools; those used at last for deepening the finer lines being scarcely larger than ordinary darning-needles. The manufacture of shell-cameos in Rome commenced about 1805, and is said to have been of Sicilian origin. The art was at first confined to Italy; but during the last 35 years, it has been carried on in Paris to a greater extent than even in Rome, though not with equal success. A large proportion of the whole cameos manufactured in France are imported into England, and many of them are mounted as brooches, and exported to the United States and the British colonies. Saolini and Giovanni Dies have long been celebrated as artists in shell-cameo in Rome, whilst Girometti has enjoyed a similar reputation for his works in *pietra dura*.

CAMERA LUCIDA, an optical instrument constructed of various forms, and for various purposes. Dr. Wollaston's C. L., intended to facilitate the perspective delineation of objects, consists of a small quadrilateral prism of glass, of which AB in the

Camera Lucida.

annexed figure is the perpendicular section, held in a brass frame, which is attached to an upright rod, having at its lower end a screw-clamp, to fix it to the edge of a table. The prism being at the height of about a foot from the table, has its upper face horizontal. Two of its faces, as in the figure, are at a right angle at A; the contiguous faces make respectively with them angles of $67\frac{1}{2}^\circ$; so that the remaining obtuse angle at B contains 135° . Rays coming from an object PQ, and falling nearly perpendicularly on the first surface, enter the prism, and undergo total reflection at the contiguous surface (see DIOPTRICS); they then fall at the same angle on the

next surface, and are totally reflected again; finally, they emerge nearly perpendicularly to the remaining surface. An eye, as in the figure, then receives the emergent pencil through one part of the pupil, so that an image, *pq*, of the object is seen projected upon a sheet of paper upon the table. The rays from the drawing-pencil passing the edge of the prism, enter the other part of the pupil; and the pencil and image being seen together upon the paper, a sketch of the latter can be taken. There is, however, a practical difficulty—the image and the drawing-pencil are at distances sensibly different from the eye, and so cannot be seen together distinctly at the same time. To obviate this, a plate of metal, with a small aperture as an eye-hole, is placed at the edge under the eye, so that the rays through the prism, and those from the drawing-pencil, which both pass through the eye-hole, form only very small pencils. By this, the difficulty is greatly diminished. It is still, however, difficult to use the instrument satisfactorily; and though many acquire great readiness in its use, others have never been able to attain the same facility. The instrument is remarkable for its small bulk and portability. A good one will pack in a box 8 in. by 2, and $\frac{1}{2}$ in. deep. Besides this form of the C. L., which is the most common, there are others. Its simplest form is merely a piece of smooth glass fixed at an angle of 45° to the horizon. An image from a horizontal object falling on this glass will be perfectly reflected, and that in the vertical, so that the eye looking vertically down will see the image, and, owing to the transparency of the glass, the artist will be able to trace it out upon paper below. In this case, however (see CATOPTRICS), the image will be inverted.

CAMERA OBSCURA (literally, a dark chamber), an instrument invented by Baptista Porta in the 16th century. It is known in its simplest form as a familiar toy, consisting of a rectangular box, furnished at one end with a lens whose focal length is equal to the length and depth of the box; at the opposite end of which a plane reflector is placed at an angle of 45° , which throws the image of any objects to which the lens may be directed on a piece of ground-glass on the top of the box in a non-inverted position, so that they may be viewed or sketched from as in nature.

The C. O. being now an indispensable article in the practice of photography, has received a number of recent improvements, which make it rank as a scientific instrument. The principle, however, involved in the simplest and most refined forms is the same, and may be illustrated and made intelligible by the following experiment: Let a small hole be bored in a window-shutter, and the room be darkened. If, now, the beam of light entering the room by this hole be intercepted by a sheet of white paper,

held at a small distance from the hole, an inverted image of objects without will be seen upon the paper. By placing a small convex lens over the hole, this image is rendered much more distinct, or *sharp*, in photographic language. Moreover, it will be found that, at a certain distance from the hole, the image attains a maximum degree of sharpness; and that if the paper be removed from this point to any position either nearer to the hole or further from it, the image becomes indistinct and confused. At the point of greatest distinctness, the image is said to be *focused*. Such being the principle of the camera, it is evident that in practice the instrument may assume many forms, provided always that it consists of a darkened box or chamber having a hole at one end for the insertion of a lens, or combination of lenses, and at the other a screen, generally made of ground-glass, on which to receive the image.

The body of the instrument may be made of any opaque substance; the tube or tubes are generally formed of brass, and contain one or more lenses; there is the obscured or ground-glass, upon which the image is thrown for the purpose of adjusting the focus; and the rack behind, by means of which, and the double sides of the camera, the body of the instrument may be lengthened or shortened till the image on the ground-screen is accurately focused. This rack is most frequently placed upon the tubes carrying the lenses. The interior of the whole apparatus is blackened, to prevent reflection of the rays falling on their sides, and to impart greater distinctness to the picture.

The *camera-slide* is a thin, dark box, and is used for conveying a sensitive plate from the operating-room to the camera, and back again after exposure. It consists of a rectangular frame, made to fit exactly into the back of the camera when the focusing-screen is removed. At the back is a hinged door, by means of which the plate is introduced into the slide; and in front is a shutter, which is pulled up when the plate is to be exposed, and shut down after the time requisite for the action of the light upon the plate has expired. It must be constructed so that, when substituted for the focusing-screen, the surface of the prepared plate, which is intended to receive the image, shall correspond exactly in distance from the lens with the ground-surface of the focusing-screen. The plate rests upon projections of silver wire in the corners of the slide; and the same slide may be used for plates of different sizes, by introducing into it thin frames of suitable dimensions also furnished with silver-wire corners.

Photographic cameras are generally required for one of three purposes—viz., portraits, landscapes, or copying; and for each of these it is necessary to make suitable modifications in the construction of the instrument. A camera has, however, been recently contrived which combines within itself the conditions necessary for all contingencies. It is called Martin's universal portrait, landscape, and copying camera, and consists, primarily, of a base-board, 30 in. long and 11 in. wide, divided into three pieces, and hinged together by means of broad brass hinges, so as to diffuse the bearing as much as possible, and bolted together when in use by sliding panels of mahogany, extending across the entire width of the base-board. This base-board being grooved on its outer edges, allows the sliding portions of the camera to be moved from one end to the other, so as to alter the relation between object, lens, and image *ad infinitum*.

What may be regarded as the body of the camera, is of the same construction as an ordinary expanding camera, except that it is furnished with additional apertures for camera slides, and the front and the back are united by means of an accordion or bellows body of suitable length to extend from one end of the base-board to the other.

CAMERA'RIVS, JOACHIM—originally, *Liebhard*, which name he changed into C., because his forefathers had been *Kämmerer* (chamberlains) at the court of the bishop of Bamberg—was born at Bamberg, April 12, 1500, and died at Leipsic, after a life devoted to literature, April 17, 1574. He was by nature earnest and taciturn; but the extent of his knowledge, his sobriety of opinion, strength of character, and, when he pleased, overpowering eloquence, won for him the esteem of all his contemporaries. His works, of which several still remain valuable, include an excellent biography of Melancthon, and a collection of letters by this reformer; also annotations on Cicero's *Questiones Tusculanae* (1525); *Elements of Rhetoric*; *Commentarii Linguae Graecae et Latinae* (1551); and *Epistolae Familiæres* (1583-95), giving interesting notices of his times.—His son, JOACHIM C. (b. 1534, d. 1598), was one of the most learned physicians and botanists of his age.

CAMERA'RIVS, RUDOLPH JAKOB, 1665-1721; a German botanist and physician, professor of medicine and director of the botanic garden at Tübingen. He was the first to observe and establish the sexual theory of plants.

CAMERINO (ancient *Camerinum*), a t. of central Italy, in the province of Macerata, situated on a hill at the foot of the Apennines, 41 m. s.w. of Ancona. It has a cathedral, occupying the site of a temple to Jupiter, a university, and some manufactures of silk. Its bishopric dates from the 3d c.; and it was made an archiepiscopal see in 1787. Pop. 5,500.

CAMERON, a parish in s.w. Louisiana, on the gulf of Mexico; surface low, with many swamps; productions, agricultural; pop. '70, 1591-342 colored. Chief town, Grand Chenière.

CAMERON, a co. in n.w. Pennsylvania, traversed by the Philadelphia and Erie railroad: 400 sq. m.; pop. '70, 4,273. Productions, agricultural. Co. seat, Emporium.

CAMERON, a co. in Texas, on the gulf of Mexico and the Rio Grande; 3,000 sq. m.; pop. '70. 10,999—157 colored. The portion along the Rio Grande is very fertile; the remainder is grazing land. Co. seat, the city of Brownsville, opposite Matamoros.

CAMERON, DONALD, a Scottish highland chief who fought for the pretender and was wounded at Culloden, but escaped to France. He was the "Lochiel" of Campbell's poem.

CAMERON, JAMES DONALD (usually called "DON" CAMERON), b. Harrisburg, Penn., 1833; eldest son of Simon; graduated at Princeton college in 1852, and since largely engaged in iron, coal, and manufacturing industries of his state. As president of the Northern Central railroad, he did great service to the union cause during the war. In 1876, he was appointed secretary of war, and in Mar., 1877, succeeded his father as U. S. senator. In 1879, he was chosen chairman of the republican national committee in place of Zachariah Chandler, deceased. This position he resigned in 1880.

CAMERON, JOHN, a famous scholar and divine, was b. at Glasgow about the year 1580, and educated at the university of that city, where, in his 20th year, he held an appointment as reader in Greek. In 1600, he set out to travel in France, where his ability and erudition secured for him a philosophical professorship in the university of Sedan. He afterwards acted as a Protestant clergyman at Bordeaux, and on the death of Gomarus, was appointed to the divinity chair in the university of Saumur, an appointment he held until 1620. Returning to Britain, he was appointed professor of divinity at Glasgow; but in less than a year he returned to Saumur; thence to Montauban, where he received a divinity professorship. Here his opposition to the party who advocated a civil war made him many enemies, by one of whom he was stabbed in the street; and he died from the effects of the wound in 1625. He was considered one of the best scholars of his time; in Biblical criticism, he was inclined to be perverse; where there was a difficulty, he usually chose the opposite view to that held by other divines, especially Beza. His theological opinions were of a somewhat lax character, his works being said to be the foundation of Amyraut's doctrine of universal grace.

CAMERON, RICHARD, a Scottish Presbyterian preacher in the 17th c., who suffered death for the cause he espoused, and from whom the religious sect ordinarily called Cameronians (q. v.) has been named. C. belonged to the extreme party, who held by the perpetually binding obligations of the solemn league and covenant (see COVENANTS), which were set aside at the restoration of Charles II. Along with some others, he strenuously resisted those measures that reinstated the Episcopal church in Scotland, and that proscribed the meetings for public worship of unauthorized religious bodies. Contrary to law, he persisted in preaching in the fields, and became obnoxious to government, to which, indeed, he finally assumed an attitude of defiance. In June, 1680, he, in company with about twenty persons of equal zeal, well armed, entered the town of Sanquhar; and in the market-place they formally renounced their allegiance to Charles II., who had so grossly abused his power, and declared war against him and all his adherents. After this act they retired to the hills between Nithsdale and Ayrshire, where they succeeded in evading capture for a month, though a price of 5,000 merks had been set upon C.'s head by government, and 3,000 upon the heads of the others. On the 20th July, 1680, however, they were surprised by a vastly superior force in Aird's Moss, and after a brave fight, C. was killed. His hands and head were cut off, and fixed upon the Netherbow Port, Edinburgh. C. ranks as a martyr, and has an honorable place in the history of *Scots Worthies*.

CAMERON, SIMON, b. in Lancaster co., Penn., 1799. In 1845, he was elected by the democrats to the U. S. senate, but joined the republicans on the organization of that party, and was by them re-elected to the senate in 1856. In 1861, he was secretary of war, and in 1862 minister to Russia. Twice again he was chosen senator, in 1866 and in 1874, and was succeeded in that office in 1877 by his son, James Donald. He is one of the leading financiers and business men of the state.

CAMERON, VERNEY LOVETT, the African traveler, son of the Rev. J. H. L. Cameron, vicar of Shoreham, Kent, was b. in 1844. He entered the navy in 1857, and served some time on the e. coast of Africa. In 1873, he took charge of an expedition to relieve Livingstone, his orders being to join him by the nearest route. He started from Bagamoyo in Mar., and in Aug., at Unyanyembe, met Livingstone's followers bearing his remains to the coast. After making arrangements for their safe arrival, he proceeded to Ujiji, where he found some of Livingstone's papers and a map, which he forwarded to Zanzibar. He then made a survey of lake Tanganyika, which he found to be disconnected with the Nile system. In the belief that the Lualaba was the upper waters of the Congo, he resolved to follow its course to the w. coast; but owing to the hostile interposition of the native chiefs, was prevented from verifying a conviction, the correctness of which was soon afterwards demonstrated by Stanley. Taking a more southerly route, he reached the Portuguese settlement of Benguela, on the w. coast, in Oct., 1875, whence he returned to England. An account of his travels, which contains a vast number of valuable scientific observations, was published in 1877 in 2

vols., under the title of *Across Africa*. C. was made a companion of the bath, and raised to the naval rank of commander.

CAMERON HIGHLANDERS (the Queen's Own Cameron Highlanders), the designation given to the 79th regiment of infantry in the British service, in consequence of the corps having been raised by Allan Cameron of Erroch in 1793. Originally, it consisted of 1000 men, but a second battalion was added in 1804. This gallant regiment, which wears the Highland garb, performed distinguished services in the Peninsula and at Waterloo, and in the chief warlike struggles of more recent times.

CAMERONIAN REGIMENT, the 26th regiment of infantry in the British service, so called from having had its origin in a body of Cameronians (q.v.) during the revolution of 1688. Taking advantage of their zeal and courage, the convention which sat at Edinburgh induced a number of them to assist in the revolution, which it was imagined by some was to re-establish the reign of the covenants. They were induced to enlist on the understanding that the special object of the corps was "to recover and establish the work of reformation in Scotland, in opposition to popery, prelacy, and arbitrary power, in all the branches and steps thereof, till the government in church and state be brought to that luster and integrity which it had in the best of times." (See Burton's *History of Scotland*, vol. i. p. 49.) Thus was formed the celebrated C. R., with the youthful lord Angus as col., and William Cleland as lieut.col. and actual commander. Under Cleland, not yet in his 30th year, the regiment was sent northwards to quell the insurrection, after the fall of viscount Dundee. Surrounded by from 4000 to 5000 Highlanders, the Cameronians, only 800 strong, gallantly defended themselves during a whole day in Dunkeld, Aug. 21, 1689. In this terrific struggle, the brave Cleland was killed. Considering the issue of the revolution, they had been entrapped into military service, and their employment on foreign service afterwards greatly scandalized the Cameronian sect. The regiment has ever done credit to its origin; being distinguished alike for gallantry and for good conduct.

CAMERONIANS, the religious sect in Scotland popularly named after Richard Cameron (q.v.). Its official designation, however, is that of Reformed Presbyterians. No doubt, the principles of the body are those for which Cameron contended and died; but not till after 1688 did the small body of Presbyterians, who insisted upon the restoration of the civil and ecclesiastical polity of 1638 to 1649 in opposition to the revolution settlement, assume a distinct form. According to the solemn league and covenant, ratified by the parliaments of England and Scotland, and also by the assembly of divines at Westminster in 1643, presbyterianism was to be maintained in the kingdoms of England, Scotland, and Ireland, and popery, prelacy, superstition, heresy, schism, etc., were to be extirpated. As a measure of pacification, presbyterianism was established in Scotland by act of parliament, 1690; but it was of a modified kind, rendering the church a creature of the state, more particularly as regards the calling of general assemblies. Equally to the disgust of the extreme party referred to, prelacy was confirmed in England and Ireland, and there was a general toleration of heresy—i.e., dissent. In sentiment, if not in form, therefore, this party repudiated the government of William III. and his successors, and maintained the perpetually binding obligations of the covenants. Unquestionably, these C. acted under strong convictions, and only desired to carry out to a legitimate issue theoretical principles of the church of Scotland which, for prudential considerations, have been practically in abeyance; and it is in the standards of this sect that we find a true embodiment of the tenets held by the great body of English and Scotch Presbyterians of 1643. Although thus an elder sister of the existing church of Scotland and all its secessions, it was with some difficulty that, after the revolution, it organized a communion with ordained ministers. The steadfastness of members was put to a severe trial by the defection of their ministers; but in 1706, after their faith and patience had been tried for 16 years, they were joined by the Rev. John M'Millan, from the Established church; and shortly afterwards, by the Rev. John M'Neil, a licentiate of the same church. To confirm the faith of members, and give a public testimony of their principles, the covenants were solemnly renewed on Auchensauch hill, near Douglas, in Lanarkshire, in 1712. The subsequent accession of the Rev. Mr. Nairne enabled the C. to constitute a presbytery at Braehead, in the parish of Carnwath, on the 1st of Aug., 1743, under the appellation of the Reformed presbytery. Other preachers afterwards attached themselves to the sect, which continued to flourish obscurely in the w. of Scotland and n. of Ireland. For their history and tenets, we refer to the *Testimony of the Reformed Presbyterian Church* (Glasgow, John Keith, 1842). Holding strictly to the covenants, and in theory rejecting the revolution settlement, the political position of the C. is very peculiar, as they refuse to recognize any laws or institutions which they conceive to be inimical to those of the kingdom of Christ; from which cause many of them formerly isolated themselves from general society, and refused several of the responsibilities and privileges of citizens. In 1860, there was an attempt on the part of some of the kirk-sessions to prevent the members becoming volunteers, on account of the oath of allegiance which required to be taken. On the question coming before the synod, it was decided (1863) that excommunication for taking the oath should cease. In consequence of this decision, 10 or 12 congregations seceded. In 1876, the larger body of the Reformed Presbyterians, consisting of about 45 congre-

gations, was formally united to the Free church of Scotland, so that the distinctive features of the Cameronians are now represented by the few congregations which seceded in 1863.

CAMERONITES, a sect in France, followers of John Cameron of Scotland. They are moderate Calvinists, and assert that the will of man is determined only by the practical judgment of the mind; that the cause of men's doing good or evil proceeds from the knowledge that God infuses into them; and that God does not move the will physically, but only morally, by virtue of its dependence on the mind. This peculiar doctrine of grace and free-will was adopted by many eminent teachers who thought Calvin's doctrine too harsh.

CAMEROONS, a river of upper Guinea, Africa, which enters the bight of Biafra from a n.e. direction, in about lat. 4° n., long. 9° 40' e., by an estuary some 20 m. in breadth. Its length is not certainly known, but for 40 m. upwards its breadth averages nearly a quarter of a mile, its depth varying in the dry season from 2 to 20 feet. The left bank of the river is steep and high, the right for many miles low and swampy, and covered with mangroves. There are several populous and thriving villages on its banks, whose inhabitants carry on an extensive trade in palm-oil, and ivory, obtained in great quantity from dead elephants, which have perished in search of water in a great morass inland.—C. is also the name of a cape on one of the islands of the estuary.—C. **PEAK** is the name of the culminating point in the C. mountains, which in lat. 4° 13' n., and long. 9° 10' e., has an elevation estimated at 13,000 feet.

CAMEROONS' (*ante*), mountains on the w. coast of Africa between 3° 57' and 4° 25' n., and 9° and 9° 30' e.; a volcanic mass covering 700 sq.m., the highest about 13,000 feet. They touch the gulf of Guinea on the w. and south. Capt. Burton ascended these mountains in 1861, finding the sides for about 4000 ft. covered with a dense growth of palms, acacias, figs, cardamoms, cabbage-trees, oaks, ferns, and bamboos. Higher up were smaller trees, and at 4580 ft. there began a labyrinth of lava streams and fields of slag. At about 8000 ft., craters appeared, of which there are nearly 30. The natives tell of an eruption in 1838.

CAMETA, a t. of Brazil, on the Tocantins, which joins the estuary of the Amazon from the south. It has a fertile district attached to it, which is estimated to contain 20,000 inhabitants.
